Winnipeg, from being a mere collection of huts and log buildings in 1870, has become a substantial city to-day. As being the seat of government for the province, and also the Dominion government centre for western Canada, it has many public buildings of importance. Among these are the provincial legislature buildings, lieutenant-governor's residence, courthouse, city-hall, Fort Garry court, Dominion post-office, custom house, land office, barracks and drill shed; standing out very prominently are the Union Bank (10 stories high), Merchants' Bank (7 stories), Bank of Commerce, Bank of British North America, and Dominion Bank. Among the notable mercantile establishments are Hudson's Bay Company Stores (departmental), doing a wide business through the whole country, McIntyre Building (a Main Street block of offices), Ogilvie Mill (the largest in Canada), Canada Life Block, etc. The leading religious bodies are represented by between 60 and 70 churches. In the province and city the religious bodies best known, in the order of their numbers, are Presbyterian, Church of England, Methodist, Roman Catholic, Lutheran, Baptist, and Congregational. The most stately church buildings are Holy Trinity, Knox, Saint Mary's (Roman Catholic), Augustine, Saint Stephen's, Grace, Saint Andrew's, and Icelandic Lutheran. The population of Winnipeg is noted as being one of the most church-going on the continent. The religious harmony of the city is remarkable, truly catholic feeling pervading all classes.

In education the city stands out prominently. Its public school buildings are probably unsurpassed for architecture, completeness and comfort by any other city in the world. They are valued at \$700,000. They are 19 in number, are conducted by 118 teachers on the regular staff, and 10 specialists in music, drill, sewing, drawing, nature study, and manual training. The highest in the system is the Collegiate Institute, a classical school with eight teachers and well provided with play grounds, gymnasium, libraries, and laboratory. The number of pupils attending the public schools (1903) is 9,500. While in the educational system of Manitoba generally one system of public schools prevails and is accepted by Catholics and Protestants alike, in the city this is not so. The Roman Catholics still maintain a number of convents and parochial schools, with probably 800 pupils. The education of teachers for the province is conducted in the Normal School, which is situated in the city. The literary taste of citizens is cultivated by a free public library with 15,000 to 20,000 volumes, at present in the city-hall, but soon to be housed in the new Carnegie Library, now being erected at a cost of \$50,000. Winnipeg is also the seat of the University of Manitoba. This is a unique institution. It is provincial and has confided to it the sole power

WINNIPEG — WINONA

of granting degrees, of conducting all examinations in medicine, the entrance in law, surveying, and civil engineering. This year (1904) 816 candidates have been examined by the university. The university has an endowment in lands of 150,000 acres, now estimated at a million and a quarter of dollars, of which about one tenth have up to date been sold. The university. The university has an endowment in our building on a plot of seven acres on Broadway, where other necessary buildings will be erected. Besides council chamber, offices, and examination hall, the university teaching in science is accommodated in this building, good laboratory facilities being supplied the professors. The specially notable character of the university is its group of affiliated colleges. These are four classical colleges, namely, Saint Boniface (Roman Catholic), Saint John's (Church of England), Manitoba (Presbyterian), Wesley (Methodist), along with a Medical College and a College of Pharmacy. For all these the university lays down the curriculum and conducts the examinations; they do all the teaching, except that in science. They have large and attractive buildings and grounds, full staffs of professors, strong financial support, and are a powerful influence in the city. Of other educational institutions there are Havergal College (Church of England) and Saint Mary's Academy (Roman Catholic) for girls.

With charitable institutions the city is well provided. The Winnipeg General Hospital, Saint Boniface General Hospital, and several private hospitals are doing successful work, to the first named a Nurses' Home and Maternity Hospital being attached. The Women's Home, Children's Home, Children's Aid Shelter, Saint Mary's Boys' Home, and Free Kindergarten Institution bear testimony to the energy of charitable ladies. Several cemeteries make up the city of the dead in the suburbs of Winnipeg. These are Saint John's, Kildonan, Saint James', Elmwood, and that belonging to the city — Brookside, besides Saint Boniface and another Roman Catholic cemetery in the south of the city.

The history of the city of Winnipeg is based on that of an earlier historical movement. The city includes the site of Fort Garry — the Mecca of the Hudson's Bay Company traders of Rupert's Land. Indeed, Fort Garry was not the first. In 1738 Fort Rouge, on the south side of the Assiniboine, was built by a lieutenant of Verandreye, the French explorer. In 1804 Fort Gibraltar was erected by the Montreal fur traders. In 1812-14 Fort Douglas, as the centre of settlement, was undertaken by the officers of Lord Selkirk, the Scottish colonizer. This was the true beginning of Manitoba and Winnipeg, when a band of Scottish Highlanders founded a farming settlement on Red River, coming in by way of Hudson Bay. Fort Garry (1) was built in 1822; Fort Garry (2) in 1835, the latter a beautiful stone fort. This became the seat of government in the Hudson's Bay Company and Red River Settlement. In 1870 Rupert's Land was transferred to Canada, and the village of Winnipeg then began as a small nucleus of houses half a mile from Fort Garry. From this hamlet sprang into being Winnipeg, which was incorporated as a city in 1873. It is now a metropolis with a great future. That there are to be three great cities in Canada: Montreal,

Winnipeg, and Vancouver, is now the voice of the prophets. Winnipeg is a cosmopolitan city, having some 20 nationalities represented in considerable numbers, but all heartily united in one Canadian spirit. Few cities on the American continent present such marvellous progress as this. The following figures of increase of population are worth examining: Pop. (1870) 215; (1874) 1,809; (1885) 19,574; (1898) 39,389; (1901, official Dominion census) 42,340; (1904, city official census) 67,000.

GEORGE BRYCE, LL.D.,

Author of 'The Remarkable History of the Hudson Bay Company.'

Winnipeg, Lake, Canada, in the province of Manitoba is about 250 miles long, and from 5 to 70 miles broad. It receives the surplus waters of Lakes Winnipegosis and Manitoba, besides the Winnipeg River, but its chief tributaries are the Saskatchewan and the Red River. Its surplus water is discharged by the Nelson River into Hudson Bay. Winnipeg River, which flows into Lake Winnipeg, rises in the Lake of the Woods, and has a length of about 250 miles. With the exception of a short portage at Fort Frances Falls it is navigable for 208 miles.

Winnipegosis, win'-i-pě-goo'sis, Lake, a lake in northwestern Manitoba, extending into Saskatchewan. It lies to the west of Lake Winnipeg (q.v.) and parallel with it; its length is 127 miles, the width 17 miles; its elevation above sea-level 828 feet. It is generally shallow, the greatest depth not being over 40 feet. It receives the Red Deer and Swan rivers, and a few other smaller streams, and discharges into Lake Manitoba to the southeast, through the Water Hen River.

Winnipiseogee, win-ě-pě-sá'gě, a lake in the east central part of New Hampshire. Its average length is 25 miles; width from one to 10 miles; area 178 square miles; and 475 feet above sea-level. The outlet is Winnipiseogee River, which flows into the Merrimac River. It has an irregular coast line, and contains a number of islands. The waters abound with fish. There are many summer cottages on the islands and along the shores.

Winnsboro, S. C., city, county-seat of Fairfield County; on the Southern Railroad; about 34 miles north of Columbia. It is in an agricultural region, and in the vicinity are large stone quarries. At one time the city manufactured all the cotton-gins used in the United States. The educational institutions are Mount Zion Institute, established in 1878, as a public high school, but chartered as a school in 1777, and graded elementary schools. The bank has a capital of \$120,700. Pop. (1890) 1,738; (1900) 1,765.

Winona, wī-nō'na, Minn., city, county-seat of Winona County; on the Mississippi River, and on the Chicago, Milwaukee & Saint Paul, the Chicago, Burlington & Quincy, the Green-Bay & Western, the Winona & Western, and the Chicago & Northwestern R.R.'s; about 105 miles southeast of Saint Paul. The surrounding scenery is most picturesque, the peculiar rocks in and near the city are of interest. Sugar Loaf and Trempealeau Mountains are remnants of once lofty elevations, but are now included with the high bluffs which border the city. The

WINONA — WINSLOW

ity has steamer connection with all the Mississippi River ports, and the bridges which span the river at this point connect the city with places in Wisconsin. It is in an agricultural and stock-raising region.

The chief manufacturing establishments are flour and lumber mills, agricultural-implement works, wagon and carriage factories, railroad shops, breweries, and patent medicine works. In 1900 (government census) Winona had 162 manufacturing establishments which were capitalized for \$6,192,386 and in which were employed 2,214 persons, who received annually wages to the amount of \$928,400. The total cost of the raw material used each year was \$4,292,845 and the value of the finished product was \$6,576,382. Winona has excellent transportation facilities and ships annually large quantities of grain, hay, vegetables, lumber, and live stock.

The principal public buildings are the government building, the court-house, municipal buildings, the Winona General Hospital, the Margaret Simpson Home, opera house, churches, and schools. There are 24 churches including a Roman Catholic cathedral. The educational institutions are a State normal school, established in 1868; Winona Seminary (R. C.), for young women, a public high school, opened in 1887, 10 public and four parish schools, Toland's Business University, and several private schools. There are five banks, which have a combined capital of \$700,000, and (1903) deposits amounting to \$5,198,850. The city owns and operates the water-works.

Winona was settled in 1851 and in 1852 was laid out as a town. In 1857 it received a city charter. Its growth has been somewhat rapid; but it has had no fictitious booms nor serious drawbacks. Pop. (1890) 18,208; (1900) 9,714; (1903, est., Gov. Report) 20,167.

Winona, Miss., town, county-seat of Montgomery County; on the Southern and the Illinois Central R.R.'s; about 85 miles north by east of Jackson. It is in an agricultural region in which cotton and grain are the chief products. It has flour and grist mills, cotton gins, and agricultural implement works. The two banks have a combined capital of \$150,000. The high school was established in 1887. Pop. (1890) 1,648; (1900) 2,455.

Winooski, Vt., village in Chittenden County; on the Central Vermont Railroad; two miles north of Burlington. It has an electric railway to Burlington. It is in a fertile agricultural region, and has considerable manufacturing interests. The chief industrial establishments are sash, door, and blinds factories, wagon and carriage works, cotton and woolen mills, iron and brass works, machine shops, flour mill, and furniture factory. It has a high school, Providence Academy (R. C.), public and parish schools, and the Fanny Allen Hospital. There is one bank with a capital of \$55,000 and deposits of about \$1,000,000. Pop. (1890) 3,659; (1900) 3,783.

Winooski, or Onion, a river in Vermont, which has its rise in the northeastern part of the State, flows west, breaking through the Green Mountains, and enters Lake Champlain about five miles northwest of Burlington. Total length about 100 miles. In several places it has cut deep picturesque gorges, and it has

several falls. The falls at Middlesex and Winooski furnish extensive water-power for manufacturing. The valley of the Winooski is noted for its beautiful scenery.

Win'ship, George Parker, American author and librarian: b. Bridgewater, Mass., 1871. He was graduated from Harvard in 1893, was assistant in history there in 1893-5, and has since been in charge of the John Carter Brown Library, Providence, R. I. He has written: 'The Coronado Expedition' (1896); 'Geoffrey Chaucer' (1900); 'Cabot Bibliography' (1900); etc., and has edited Wafer's 'Darrien' (1903); and 'The Harris Papers' (1903).

Winslow, winz'lo, Edward, American colonial governor: b. Droitwich, Worcestershire, England, 19 Oct. 1595; d. at sea, between Santo Domingo and Jamaica, 8 May 1655. While making a tour of the Continent he became a member of John Robinson's Leyden congregation. He was one of the passengers in the Mayflower, and in the first conference with Massasoit offered himself as a hostage, and won the attachment of the Indian chief, which he increased in 1623 by curing him of a severe illness. After the death of his wife during the first winter at Plymouth he married Mrs. Susannah White, mother of Peregrine White, her husband having died in that same winter also, and theirs was the first marriage in New England. In 1623-4 he made two voyages to Europe as agent for the colony, of which he was chosen governor in 1633, 1636, and 1644. While visiting England again in 1639, as agent for the colony, he was imprisoned by Laud in the Fleet prison for 17 weeks on the charges of having taught in the church, although a layman, and of having performed marriage as a magistrate. Another voyage was made by him in 1646 to answer charges against the colonists of religious persecution and intolerance. In 1649 he again visited England, was instrumental in the organization of the society for the propagation of the gospel in New England, and was employed in various public affairs under the Commonwealth. In 1655 Cromwell appointed him one of three commissioners to superintend an expedition against the Spaniards in the West Indies, and he died before its completion. He was the author of several works, mostly controversial writings in defense of New England. The principal are: 'Good News from New England' (1624); 'Hypocrisy Unmasked' (1646); 'The Danger of Tolerating Levellers in a Civill State' (1649); and 'Glorious Progress of the Gospell amongst the Indians' (1649). These have been reprinted by the Massachusetts Historical Society.

Winslow, Forbes Benignus, English alienist: b. London, of a Massachusetts family, August 1810; d. Brighton, Sussex, 3 March 1874. He came to this country in early life, studied medicine in New York, was graduated from the College of Surgeons, London, in 1835, and took his M.D. at Aberdeen. Having after 1830 paid special attention to the study of insanity, he opened a private asylum at Hammersmith, and later another in London, and came in time to be a supreme authority on all relating to diseases of the brain. He founded and edited the 'Quarterly Journal of Psychological Medicine and Mental Pathology' (1848) and the 'Medical Critic' (1861), was the juridical and president

WINSLOW

of the Medical Society of London (1853), and a member of numerous scientific bodies. He published: 'The Application of Phrenology to the Elucidation and Cure of Insanity' (1831); 'Anatomy of Suicide' (1840); 'Plea of Insanity in Criminal Cases' (1843); 'Notes on the Lunacy Act' (1845); 'Softening of the Brain' (1849); 'Lethsonian Lectures on Insanity' (1854) 'Obscure Diseases of the Brain and Disorders of the Mind' (1860; 4th ed. 1868); 'Light, its Influence on Life and Health' (1867); etc.

Winslow, Hubbard, American Presbyterian clergyman: b. Williston, Vt., 30 Oct. 1799; d. there 13 Aug. 1864. He was graduated from Yale in 1825 and from Yale Theological Seminary in 1828. He was pastor of the First Church, Dover, N. H., 1828-32, and of the Bowdoin Street Church, Boston, 1832-44, and during the next 10 years was the principal of the Mount Vernon Young Ladies' Institute at Boston. He edited the 'Religious Magazine' 1837-40, lectured widely on religious and secular topics, was pastor of the First Presbyterian Church, Geneva, 1857-9, and of the Fiftieth Street Presbyterian Church, New York, 1861-2. He was a voluminous writer, and among his works may be cited 'The Doctrine of the Trinity' (1831); 'Controversial Theology' (1832); 'The Appropriate Sphere of Woman' (1837), republished as 'Woman as She Should Be' (1838); 'Elements of Intellectual Philosophy' (1852); 'The Hidden Life' (1863).

Winslow, John, American soldier: b. Plymouth, Mass., 27 May 1702; d. Hingham, Mass., 17 April 1774. In 1740 he was appointed by the council captain of a company recruited in Boston for the expedition against Cartagena (q.v.); and in June 1754 sailed in the provincial ship Massachusetts to build a fort on the Kennebec. This he began on a point half a mile below the Teconick Falls, where it was finished by William Lithgow in the next year. With Scott he was a commander of the 1,800 troops sent by New England in 1755 to remove the French from the posts established on the Bay of Fundy. The French forts at Beauséjour and Gaspereau were taken, and on 11 August Winslow, then with rank of lieutenant-colonel, and in command at Mines, was instructed to remove the Acadians in his vicinity, a task which he described to the French inhabitants as "very disagreeable." He strictly followed his orders, however, as "it is not my business to animadvert." In 1756 he was appointed to command the campaign on Lake Champlain, holding now the grade of major-general, and was stationed at Fort William Henry. He led another expedition to the Kennebec in 1758-9, and subsequently was chief justice of the court of common pleas for Plymouth County, and a member of the legislature and the council. He was associated with Samuel Adams in the preparation of documents regarding the Stamp Act troubles.

Winslow, John Ancrum, American naval officer: b. Wilmington, N. C., 19 Nov. 1811; d. Boston, Mass., 29 Sept. 1873. He was appointed midshipman in the navy in 1827, was promoted lieutenant in 1839, and served in the Mexican War, participating in the expeditions against Tabasco, Tampico, and Tusan. He was made commander in 1855, in 1861 joined the Mississippi flotilla, and in 1862 was commissioned cap-

tain. In 1863-4 he was in command of the steamer Kearsarge, assigned to the special duty of pursuing the Confederate privateer Alabama. On 14 June 1864 he found the Alabama off Cherbourg, France, and blockaded her in that harbor until 19 June, when Captain Semmes notified Winslow of his intention to fight. The Kearsarge steamed seven miles out from shore in order to be on neutral waters, and then turned to meet the privateer. The Alabama fired the first shot, and the battle continued for an hour and a half, the vessels fighting in circles, which brought them constantly closer until the distance between them was but 600 yards. The Alabama then began to sink and raised the white flag. Winslow numbered but three killed and wounded out of his crew of 163 officers and men, and took 65 prisoners. It was the most important sea fight of the war between two ships, and Captain Winslow received a vote of thanks from Congress, and was promoted commodore, his commission dating from the hour of his victory. He was in command of the Gulf squadron in 1866-7, was promoted rear-admiral in 1870, and was commander-in-chief of the Pacific squadron in 1870-2.

Winslow, Josiah, American colonial governor, son of Edward Winslow (q.v.); b. Marshfield, Mass., 1629; d. there 18 Dec. 1680. From the command of the Marshfield military company in 1652 he rose to the rank of major and commander-in-chief of the forces of the Plymouth colony in 1658. He was chosen deputy in 1657, and was one of the commissioners of the united colonies from 1658 to 1670. He was assistant governor of the Plymouth colony for several years prior to 1673, and from that date till his death was its governor, the first native-born governor in New England. During King Philip's War he was *ex officio*, and, according to rank, general-in-chief of the entire army of the united colonies. He wrote a poem commemorative of Governor Bradford, which may be found in Morton's 'New England Memorial' (1669).

Winslow, Miron, American missionary: b. Williston, Vt., 11 Dec. 1789; d. Cape of Good Hope, Africa, 22 Oct. 1864. He was graduated from Middlebury College, Vt., in 1815 and from Andover Theological Seminary in 1818. He went as a missionary of the American Board to Ceylon 1819, and continued in the mission field for 44 years. He founded the Madras mission 1836; was president of the native college at Madras 1840; translated the Bible into Tamil 1835; and published 'A Tamil and English Dictionary' (1862), a great work, containing over 67,000 Tamil words.

Winslow, William Copley, American Egyptologist, son of Hubbard Winslow (q.v.): b. Boston, Mass., 13 Jan. 1840. He was graduated from Hamilton College, Clinton, N. Y., in 1862 and from the General Theological Seminary, New York, in 1865. He took orders in the Episcopal Church, was rector of Saint Luke's Church, Lee, Mass., 1867-70, and for many years secretary of the Free Church Association in the Episcopal Church. He was assistant editor of the New York *World* 1862-3, and editor of the 'Christian Times' 1863-5, and was long vice-president, secretary, and treasurer of the Egypt exploration fund for the United States. He has written: 'Israel in Egypt';

WINSOR — WINSTON-SALEM

'The Store City of Pithom' (1885); 'A Greek City in Egypt' (1887); 'The Egyptian Collection in Boston' (1890); 'The Pilgrim Fathers in Holland' (1891); 'Governor Edward Winslow'; etc.

Winsor, win'zör, Justin, American historian and librarian: b. Boston, Mass., 2 Jan. 1831; d. Cambridge 22 Oct. 1897. He was educated at Harvard and subsequently studied at Paris and Heidelberg. He was superintendent of the Boston Public Library 1868-77, and librarian of Harvard 1877-97. He published: 'History of the Town of Duxbury' (1849); 'Bibliography of Original Quartos and Folios of Shakespeare' (1875); 'Reader's Handbook of the American Revolution' (1880); 'Memorial History of Boston' (edited 1880-2); 'Narrative and Critical History of America' (edited 8 vols. 1884-9), his most scholarly achievement; 'Christopher Columbus' (1891); 'From Cartier to Frontenac' (1894); 'The Mississippi Basin: The Struggle in America between England and France' (1895). He ranked as the highest authority on the early history of North America.

Win'sted, Conn., borough, county-seat of Litchfield County; on the Mad and Still rivers, and on the Central N. E. and the New York, N. H. & H. R.R.'s; about 28 miles northwest of Hartford. It is in an agricultural region, and is the commercial and industrial centre for quite an extent of country. The Mad River furnishes considerable water-power, which is utilized for manufactories for cutlery, clocks, leather, spool silk, edge tools, pins, hosiery, and undertakers' supplies. The town of Winchester, in which is the borough of Winsted, had, in 1900 (government census), 133 manufacturing establishments, capitalized for \$2,971,429, and employing 1,746 wage earners. The value of the annual products was \$2,928,822. From 1900 to 1904 the manufacturing industries have increased; the number of employees (1904) is now about 3,000. The educational institutions are the Memorial and Gilbert School libraries. Located in Winsted are the Litchfield County Hospital of Winchester, Old People's Home, and the Gilbert Home for Indigent Children. There are four banks, which, in 1903, had deposits amounting to \$3,737,080. Winsted receives considerable water-power from Long Lake, a body of water on the western side of the borough; and the water-supply comes from Crystal Lake.

The place was settled in 1756. The town of Winchester was founded in 1771, and Winsted was incorporated as a borough in 1858. The government is vested in a warden and six burgesses. Pop. (1890) 4,846; (1900) 6,804. Pop. of the town of Winchester (1890) 6,183; (1900) 7,763.

A. B. STEVENS,
(*Winsted Daily Citizen.*)

Win'ston, John Anthony, American politician: b. Madison County, Ala., 4 Sept. 1812; d. Mobile, Ala., 21 Dec. 1871. He was educated at Lagrange College, Ala., and at the University of Nashville, Tenn., and subsequently engaged as a cotton planter and commission merchant. He was elected to the State Assembly in 1839-40, and in 1842; to the State Senate in 1845, serving until 1852; and was president of that body in 1845-8. At the Baltimore convention

of 1848 he was the recognized leader of the Alabama Democracy, and in 1853-6 was governor of his State. He was the first native-born governor of Alabama, and by his refusal to sign certain bills for aiding railroad companies by State loans he gained the title of the "veto governor." His course was sanctioned, however, by the people, as he was re-elected in 1855 and his measures were sustained by the legislature in the following session. He was a delegate to the Charleston convention of 1860 and opposed secession, but later became a colonel in the Confederate army. He commanded a brigade in the Peninsular campaign, and was conspicuous for gallantry at Seven Pines, but his health compelled his retirement from the army soon afterward, and he took no further active part in the War. He was a member of the State constitutional convention in 1865, and in 1866 was elected to the United States Senate, but was refused admission.

Winston, N. C. See WINSTON-SALEM.

Winston-Salem, N. C., twin city, county-seat of Forsyth County; on the Norfolk & W. and the Southern R.R.'s; 115 miles north of Raleigh and 28 miles west of Greensboro. Winston and Salem have independent municipalities, but as they are one commercially and industrially, they are usually called Winston-Salem. The city is the commercial centre of a fertile agricultural region, especially noted for its tobacco. It is a manufacturing city of importance; the tobacco manufacture is the leading industry; there are large tobacco warehouses, and plug and leaf tobacco factories, representing about \$2,000,000 capital invested; other industrial establishments include chemical works (the largest in the South), roller mills, cotton mills, knitting mills, a box factory, machine shops and foundries. The business is mostly concentrated in Winston, while Salem is mainly residential. The streets are broad and well paved, and there is a large park; the city has an electric railway, and two systems of water-works, one under the ownership of the municipal government of Winston. Of the public buildings the court-house in the central square of Winston and the city-hall and armory are the most notable; plans are under consideration (1904) for the erection of a United States government building. There is an excellent public school system, including a graded school for colored children; and the city is also the seat of the Salem Academy and College, a Moravian school for young women, founded in 1802; the Salem Boys' School (Moravian); and the Slater Industrial and Normal School, a non-sectarian institution for the colored race.

Salem was founded, in 1766, by Moravians as a church community. For a number of years the town was governed by the church in affairs secular as well as religious. The Moravian bishop, Count Zinzendorf (q.v.), made the plans for the city and for the government which existed during the first years. The government of Salem is now administered under the revised charter of 1891; the government of Winston under the charter of 1899; in both cases the mayor is elected every two years. Pop. Winston (1890) 8,018; (1900) 10,008; (1903, est.) 10,600; pop. Salem (1890) 2,711; (1900) 3,642.

G. F. WEBB,

Sec'y Winston-Salem Chamber of Commerce.

WINT — WINTERGREEN

Wint, Peter De. See DE WINT, PETER.

Winter, John Strange. See STANNARD, HENRIETTA.

Winter, William, American author and dramatic critic: b. Gloucester, Mass., 15 July 1836. He was graduated from the Harvard law school in 1857; was admitted to the Suffolk County bar, but never practised; published in 1854 a book of verse, 'The Convent, and Other Poems'; and was for a time a successful lyceum lecturer. From 1860 he was a contributor to the 'Saturday Press' and other New York periodicals; for several years was assistant editor of the 'Albion'; and in 1865 became dramatic reviewer for the *Tribune*, for which he has since continued to write. He was at one time also managing editor of the New York 'Weekly Review'; and he has been a frequent contributor to leading magazines and reviews. In addition to his criticism, he became known also for his biographical studies, and his sketches of travel abroad and historic foreign localities. His prose style is one of considerable distinction, and his verse is finished in character. He wrote further: 'The Queen's Domain and Other Poems' (1858); 'My Witness' (1871), poems; 'Thistle-down' (1878), poems; 'Poems,' complete edition (1881); 'The Jeffersons' (1881); 'English Rambles' (1883); 'Henry Irving' (1885); 'Shakespeare's England' (1886), chapters of travel and historical study; 'Stage Life of Mary Anderson' (1886); 'The Wanderers' (1888); 'Gray Days and Gold' (1891); and 'Old Shrines and Ivy' (1892), essays on England; 'Shadows of the Stage' (1892-3-5); 'The Life and Art of Edwin Booth' (1893); and 'The Life and Art of Joseph Jefferson' (1894). He also edited (1881) the works of Fitz-James O'Brien (q.v.), and 'The Shakespearian and Miscellaneous Plays of Edwin Booth' (1899).

Winter, one of the four seasons, the coldest of the year. Astronomically considered, winter begins in northern latitudes when the sun enters the sign of Capricorn, or at the solstice about 21 December, and ends at the equinox in March; but in its ordinary sense it is taken to include the months of December, January and February.

Winter-berry, several members of the genus *Ilex*, of the holly family, are known by this name, including the inkberry (q.v.). They are all native to eastern North America, but the species commonly indicated by the name is the black alder (*I. verticillata*), an arborescent shrub, common in swampy places and along the banks of streams, often overhanging the water. The acute, oval leaves turn black in autumn, and the axillary cymes of tiny polygamodioecious, whitish flowers, are succeeded by brilliant scarlet berries, that are as large as a pea, and are so crowded on the bare branches as to appear verticillate. They remain on the shrub all winter, and twigs are often sold by city florists for winter decoration. The bark of the winter-berry is tonic and astringent, and in infusion has been employed as a lotion for dressing ulcers.

The smooth winter-berry (*I. laevigata*) is a handsome shrub at all seasons and is similar to the black alder, but has larger stalked drupes, of a more orange tint, less crowded, and ripening earlier.

Winter-cherry, a solanaceous herb (*Physalis alkekengi*) of the south of Europe, cultivated for its ornamental fruit. It is a downy perennial, with semi-decumbent stems and broad deltoid leaves. The axillary, solitary flowers have campanulate five-lobed and whitish corollas. The calyces are also five-toothed and campanulate, but in fruit become inflated so that they are like miniature membranous balloons surrounding a pulpy, globose, cherry-like berry, which is edible, well-flavored, and acidulous, serving chiefly for preserves. These fruit-bladders are of a bright scarlet hue, and glow far into the winter. They will even keep their color for some time when cut. The plants are also known as *alkekengi*, bladder-herb, strawberry-tomato, etc. The Japanese winter-cherry (*Physalis francheti*) is very similar, but larger, having branches perhaps two feet high, with vigorous, soft, green foliage. They are profusely hung with bright orange-colored translucent lanterns, three inches in diameter.

Winter Cress. See CRESS.

Winter Flounder. See FLOUNDER.

Winter Wren. See WREN.

Wintergreen, a name applied to several cricaceous plants which retain their foliage over winter. In eastern America, the aromatic little *Gaultheria procumbens* (see GAULTHERIA) is generally the plant referred to by this name. It is a low shrub, barely six inches high, found in rocky woods, with creeping stems, half-hidden, from which arise erect, reddish branches, bearing ovate glossy leathery leaves. These are serrate with bristly tipped teeth and are gathered in a tuft at the top of the slender stalk, the fleshy, white or pinkish, urn-shaped flowers nodding underneath. The fruits are bright scarlet, mealy and spicy in flavor; and are really enlarged fleshy calyces which have enclosed the seed-capsules and assumed the form of a berry. They are sometimes called checker-berries, and remain throughout the winter. The whole plant is aromatic in taste, and is frequently eaten, foliage, berries and all. The spiciness is due to the volatile oil of *Gaultheria* (q.v.) which is a stimulant, astringent, and diuretic drug, but is chiefly used for flavoring, confectionery or pharmaceutical preparations. It is a commercial product distilled from the wintergreen where it is plentiful, or from the sweet-birch (*Betula lenta*). The various members of the genus *Pyrola* are called wintergreen, such as the round-leaved wintergreen, a common plant with a few orbicular, or oval, long-petioled and coriaceous leaves. The flowers are somewhat like those of the lily of the valley, and are fragrant. The spotted wintergreen (*Chimaphila maculata*) is another plant found in shady woods. It has a decumbent stem, sending up slender branches, which bear a few lanceolate leaves mottled with white, and several white flowers, tinged with purple. The flowering wintergreen is the charming fringed polygala (*Polygala paucifolia*), with a tuft of leaves at the top of the stem, that are not unlike those of *Gaultheria*; but it has a magenta-colored blossom with flaring wings. Still another wintergreen is the chickweed-wintergreen (*Trientalis americana*) a spring blooming herb, with a dainty white, starry blossom, poised above a whorl of foliage like tiny peach leaves.

WINTERHALTER — WINTHROP

Winterhalter, vîn'tër-häl-tër, **Franz Xavier**, German painter: b. Menzenschwand, near Saint Blasien, 20 April 1806; d. Frankfort-on-the-Main 8 July 1873. He was educated at the academies of Munich and Karlsruhe, and also studied a while in Italy. In 1834 he established himself in Paris, where he obtained the patronage of Louis Philippe, and of many persons of note. In like manner he was liberally patronized by the English court. His productions were principally portraits, with a few fancy pieces and pictures of genre. In France he painted portraits of Louis Philippe and his queen, of all the members of the Orléans family, of Napoleon III. and his empress, and of the prince imperial. He was the favorite court painter in England during the life of the prince consort and executed portraits of the Duke of Wellington, Sir Robert Peel, and other distinguished persons for the queen. His fancy pictures have little other merit than as elegantly composed figure pieces. He finished carefully, and imparted a pleasing and well-bred expression to his faces, with little or no character.

Winter's Bark, the cortex of an evergreen magnoliaceous shrub (*Drimys winteri*) of the mountains of South America. In commerce this bark is quilled or curved, gray outside, brown internally. It has a peculiar aromatic odor, a very pungent and astringent taste, and serves as a tonic, stimulant and anti-scorbutic drug. Paratudo bark is a variety of winter's bark. There are many substitutes for the drug, and much of the winter's bark of commerce is obtained from the West Indian *Cinnamodendron corticosum* and *Canella alba*.

Winter's Tale, A, a comedy by Shakespeare based on Greene's 'Pandosto' (1588), later known as the 'Historie of Dorastus and Fawnia.' Forman's Diary gives the date of the production of 'Winter's Tale' as 1611 and the play was included in the First Folio of Shakespeare 1623. In Greene's story, as in Shakespeare's, Bohemia is made a maritime country, and Dolphos an island. The name 'Winter's Tale' is derived partly from the fact that the play opens in winter, and partly from the resemblance of the story to a marvelous tale told by a winter's fire.

Win'terset, Iowa, city, county-seat of Madison County; on the Chicago, Rock Island & Pacific Railroad; about 45 miles southwest of Des Moines. It is in an agricultural region in which the chief products are wheat, corn, and hay. In the vicinity are large stone quarries. It has flour mill, creameries, machine shop, and coal and stock yards. It has an extensive trade in farm and dairy products. The four banks have a combined capital of \$125,000. There are 10 churches, public and private schools, and a public library, founded in 1891. Pop. (1890) 2,281; (1900) 3,030.

Winther, vîn'tër, **Rasmus Villads Christian Ferdinand**, Danish poet: b. Fensmark, Zealand, Denmark, 29 July 1796; d. Paris 30 Dec. 1876. He was educated at the University of Copenhagen and became immediately popular on the appearance in 1828 of his first volume of poems. He was one of the truest interpreters of the Danish national character. Some of his numerous publications are: 'Sang og Sagn' (Song and Legend) (1841); 'Lyriske

Digte' (Lyrical Poems) (1849); 'Nye Digte' (New Poems) (1850); 'Hjortens Flugt' (The Flight of the Hart) (1856), a lyric romance of the Danish Middle Ages, his greatest work.

Winthrop, win'thröp, **Fitz-John**, American colonial governor, son of John Winthrop (1606-76) (q.v.): b. Ipswich, Mass., 14 March 1638; d. Boston, Mass., 27 Nov. 1707. He studied at Harvard and afterward in England, where he served in the army of the Protectorate until the Restoration. Returning to Connecticut in 1663 he was elected to the Assembly in 1671, served as major in King Philip's War and in 1686 as a member of the council of Governor Andros. He was a magistrate in 1689, major-general commanding the expedition against Quebec in 1690, Connecticut agent at London 1693-7, and governor of Connecticut from 1698 till his death.

Winthrop, James, American jurist, son of John Winthrop (1714-79) (q.v.): b. Cambridge, Mass., 1752; d. there 26 Sept. 1821. He was graduated from Harvard in 1769, was librarian there 1772-87, and for several years was chief justice of the Massachusetts court of common pleas, and register of probate. He published 'An Attempt to Translate the Prophetic Part of the Apocalypse into Familiar Language' (1794); 'Systematic Arrangement of Prophecies relating to Antichrist' (1795); etc. His library was bequeathed to Allegheny College, Meadville, Pa.

Winthrop, John, American colonial governor: b. Edwardston, near Groton, Suffolk, England, 12 Jan. 1588; d. Boston, Mass., 26 March 1649. He studied at Trinity College, Cambridge, was bred to the law, and, according to the testimony of Cotton Mather, was commissioned at 18 a justice of the peace. His earlier years were spent on his estate of Groton Manor, but his Puritan tendencies and the current of his political sympathies presently interested him in plans for colonization in America. When in 1629 a charter was obtained creating a corporation under the name of the 'Governor and Company of the Massachusetts Bay in New England,' the piety, learning, and talents of Winthrop led to his election as governor. Converting his hereditary estate, yielding an annual income of £600 or £700, into money, he set sail in the *Arabella* from Yarmouth 7 April 1630, with a company of about 900 persons. On the voyage he composed a small treatise, entitled 'A Model of Christian Charity.' On 12 June they arrived at Salem, Mass., and the government was immediately transferred to him by Endicott, who had been the acting governor for two years by authority of the London company, before the transfer of the charter to New England. He was re-elected every year until 1634, when his popularity had somewhat declined, partly on account of his long continuance in office. In 1636, when Sir Henry Vane was elected governor, Winthrop was chosen deputy governor, and during this and the following year occurred the celebrated controversy in regard to Mrs. Hutchinson and her doctrines. In this matter Vane and Winthrop were on opposite sides, and in the election of 1637 the latter was chosen governor over Vane. The inhabitants of Boston, however, were friendly to Vane and Mrs. Hutchinson, and Winthrop was at first slighted by his neighbors. Subsequently he engaged in a controversy with his defeated

WINTHROP

opponent in regard to the alien law passed by the general court. He was re-elected every year until 1640; and in 1642 the troubled state of the colony induced the settlers to call him again to the head of the government. He was again elected in 1643, in the two following years was made deputy governor, and in 1646 governor again, which office he continued to hold the remainder of his life. In his principles Winthrop was opposed to an unlimited democracy; and when the people of Connecticut were forming a government, he wrote them a letter in which he said that "the best part of a community is always the least, and of that best part the wiser part is always the lesser." But he was attached to civil liberty, disinterested, pure, and conscientious. "It would be erroneous," says Palfrey, in speaking of the commonwealth of Massachusetts, "to pretend that the principles upon which it was established were an original conception of Winthrop's mind; but undoubtedly it was his policy, more than any other man's, that organized into shape, animated with practical vigor, and prepared for permanency, those primeval sentiments and institutions that have directed the course of thought and action in New England in later times." Winthrop kept a journal containing an account of the transactions in the colony down to the year 1649. The first two books were first published in 1790, and the manuscript of the third, which was for a long time lost, was found in 1816 in the tower of the Old South Church. The three were published in a revised edition entitled 'The History of New England from 1630 to 1649,' with notes by James Savage (1825-6). Consult 'Collections of the Massachusetts Historical Society,' 3d series, Vols. 9 and 10; R. C. Winthrop, 'Life and Letters of John Winthrop' (1864); Whitmore, 'Notes on the Winthrop Family and its English Connections' (1864); Twitchell, 'John Winthrop' (1891); Earle, 'Margaret Winthrop' (1895).

Winthrop, John, American colonial governor, son of Governor John Winthrop, of the Massachusetts Bay Colony: b. Groton Manor, Suffolk, England, 12 Feb. 1606; d. Boston, Mass., 5 April 1676. He was educated at Bury Saint Edmund's Grammar School, at Trinity College, Dublin, and at the Inner Temple, London, where he studied law. He obtained a commission in the army, and served with Buckingham in the expedition for the relief of the Huguenots near La Rochelle, France, in 1627, went in the following year to Turkey as an attaché of the British embassy, traveled in various countries of Europe, in 1631 joined his father in Massachusetts, where he became governor's assistant, and in 1633 settled at Ipswich, of which he was one of the principal founders. Obtaining a commission under a grant to the Earl of Warwick, he founded Saybrook, at the mouth of the Connecticut River, in 1635, built there a fort, and was made titular governor. In 1645 he removed his family from Boston to Pequot Harbor, and in the following year founded New London. After the union of Saybrook with Connecticut he became a magistrate of the increased colony (1651), and from 1657 to the end of his life served almost continuously as its governor. He was hearer to Charles II. (1662) of a loyal address from the Connecticut government, and received from the king a suitable charter for the

colony. Under an equally favorable charter he secured the union of the Connecticut and New Haven colonies. He was one of the commissioners of the United Colonies of New England in 1675. A student of physics and chemistry, through his scientific attainments he became a member of the Royal Society, to whose 'Transactions' he was a contributor.

Winthrop, John, American physicist, great-grandson of John Winthrop (1588-1649) (q.v.): b. Boston 19 Dec. 1714; d. Cambridge, Mass., 3 May 1779. He was graduated from Harvard in 1732 and from 1738 until his death was Hollis professor of mathematics and philosophy there. He was one of the most important American scientists of the 18th century and exercised much influence upon the scientific thought of his contemporaries, in particular upon Franklin and Count Rumford (q.v.). He noted the transits of Mercury in 1740 and 1761, going to Newfoundland in the latter year for this purpose in a vessel supplied for the purpose by the Massachusetts Province. He twice declined the presidency of Harvard, was for some years a judge of probate for Middlesex County, and was a member of the governor's council 1773-4. He was a prominent advocate of political liberty. He published 'Lecture on Earthquakes' (1755), and is sometimes claimed as the founder of the science of seismology. He published: 'Answer to Mr. Prince's Letters on Earthquakes' (1756); 'Account of Some Fiery Meteors' (1755); 'Two Letters on the Parallax and Distance of the Sun as deducible from the Transit of Venus' (1769); etc.

Winthrop, Robert Charles, American political leader: b. Boston, Mass., 12 May 1809; d. there 16 Nov. 1894. He was graduated from Harvard in 1828, studied law with Daniel Webster, and was admitted to the bar in 1831. He soon became active in political life, allying himself with the Whig party, and in 1834 was elected to the Massachusetts legislature, where he served five years, being speaker of the House for three years. In 1840-50 he was a member of Congress, and in 1847-9 speaker of the House of Representatives. In 1850, on Webster's resignation from the Senate, Winthrop was appointed his successor for the unexpired term, but in 1851 failed to secure election to the Senate. In 1851, as Whig candidate for governor, he received a plurality of votes, but the constitution at that time required an absolute majority for election; the election, therefore, went to the legislature, where he was defeated. During his term in Congress he had shown himself a conservative, and, though opposed to the extension of slavery, and to the Mexican War, he had no sympathy with the extreme abolitionists, and desired compromise between North and South. His defeat was due, therefore, to a coalition between the Free-Soilers and the Democrats in the Massachusetts legislature. After the Whig party dissolved, he took no prominent part in political work; he did not join the Republican party, but occasionally spoke in behalf of the Democrats, though not actively affiliated with them. He made frequent public addresses on various national anniversaries and occasions, being the chief speaker at the laying of the cornerstone of the Washington Monument in 1848, and on the completion of the work in 1885. He was

WINTHROP—WIRE AND WIRE DRAWING

president of the Massachusetts Historical Association for 30 years, and had a leading part in the organization and direction of the Peabody Educational Fund (q.v.). He wrote 'Life and Letters of John Winthrop' (1864); 'Washington, Bowdoin, and Franklin' (1876); 'Memoir of Henry Clay' (1880).

Winthrop, Theodore, American soldier and novelist: b. New Haven, Conn., 22 Sept. 1828; d. Big Bethel, Va., 10 June 1861. He was graduated at Yale in 1848; traveled extensively in Central and South America; studied law at Saint Louis; was admitted to the New York bar in 1855, and joined the 7th New York regiment in 1861. The 'Atlantic Monthly' from June to September of that year contained sketches by him of early war scenes. He was killed at the head of an assaulting column of Northern troops at Big Bethel. He left completed material for five volumes of novels and essays: 'Cecil Dreeme' (1861); 'John Brent' (1862); 'Edwin Brothertroft' (1862); 'The Canoe and Saddle' (1862); and 'Life in the Open Air, and Other Papers' (1863). His sister published 'Life and Poems of Theodore Winthrop' (1884).

Winthrop, Maine, town in Kennebec County; on the Maine Central railroad; 20 miles northeast of Lewiston and 10 miles west of Augusta. It has oil-cloth factories, woolen mills, agricultural implement works, a corn canery, and a grist mill. There are six churches, a high school, and graded elementary schools. It has a state bank. The oil-cloth industry was begun in Maine, in 1845, by C. M. Bailey of Winthrop. Pop. (1890) 2,111; (1900) 2,088.

Winthrop, Mass., town in Suffolk County; on Massachusetts Bay and on the Boston, Revere Beach & Lynn railroad; about five miles northeast of Boston. It is a popular beach resort, and a favorite residential section for Boston. The town was originally a part of Boston, then of Chelsea, and later of North Chelsea. In 1852 it was set off and incorporated. It contains many features of historic interest, chief of which is the Dean Winthrop house, built in 1649. It has also Forts Heath and Banks, the Winthrop Shore Reservation, the Ingalls Park, and the Frost Public Library. Pop. (1890) 2,726; (1900) 6,058.

Wintun ("people," "Indians"), a group of tribes, which, with the Patwin group form the Copehan linguistic stock of North American Indians. The habitat of the stock is northern California from Mount Shasta, including the headwaters of the Sacramento and the valley of McCloud River; thence southeastward along the Sacramento Valley to the mouth of Chico Creek, from which point to its mouth the Sacramento forms the southeastern boundary. On the west the Coast range intersects the territory of the Copehan stock, the westernmost limit of which extends almost to the south branch of Trinity River, about lat. 40° 30' N. From the latitude of Cape Mendocino the Coast range forms the western boundary as far as John's Peak, whence it extends in an irregular line southeastwardly to San Pablo Bay. The tribesmen live largely by fishing, although various roots, nuts, berries, farinaceous seeds, and clover blossoms form part of their subsistence. They are fond of the water and are constant

bathers in the streams that drain their country. Salmon are caught with spears, in the use of which they were exceedingly expert. Their weapons were formerly bows and arrows, and slings. They were indifferent hunters, but were successful in ensnaring deer in traps of their own construction. The population of the score or more of tribes forming the stock is not known, only the Nomlaki and the Wailaki being officially recognized. These are under the Round Valley Agency and are small in number.

Wire and Wire Drawing. Wire is defined as metal elongated into threads or small rods, of thicknesses varying from about half an inch to even less than $\frac{1}{1000}$ of an inch, but intended for each size to be uniform throughout the piece; these threads or rods having usually the cylindrical form, and being commonly produced by the process known as wire drawing. Essentially, this process consists in drawing or pulling a suitably prepared piece of the metal thus worked through a series of holes made in a hardened steel plate, called a draw-plate, and which successively diminish in diameter. In this way the cross section of the wire is gradually reduced to that of the last hole through which it is passed; its length, meanwhile, being correspondingly and greatly increased. As a consequence, wire can be produced only from such metals as are susceptible in this way of being pulled out or extended by stretching into rods. Such metals are said to be drawable, or to have the property of ductility. This property is not to be confounded with that of malleability, namely, that in virtue of which a metal is laminable, or admits of being hammered or rolled into thin plates; since the same metal is often malleable and ductile in very different degrees. Thus, while gold possesses both these properties in an extreme, and probably in the highest known degree, iron is ductile in a degree far beyond that in which it is malleable, and with tin and lead the reverse is true. Of the familiarly known metals, the most ductile, and in the order named, are gold, platinum, silver, copper, steel, iron, brass, zinc, lead, and tin; while aluminum, and some of the ordinarily brittle metals when made perfectly pure, as bismuth, are said to possess very high ductility. In early times metals were brought to the filamentous form only by means of beating them under the hammer into thin plates, then dividing these by cutting instruments into narrow strips, and rounding finally with the hammer and file. The earliest known mention of "wire drawers" and "wire millers," as those who produced wire by drawing were variously called, occurs in 1351 and 1360, in the histories respectively of Augsburg and Nuremberg, the previous accounts being only of "wire smiths," or those who fabricated wire with the hammer. The change from the old to the new method was accomplished, or very soon followed, by the introduction of a machine by which wire was successfully produced without direct aid of the hand; this machine, probably the invention of one Ludolf, of Nuremberg, was impelled by water power. The precious metals appear to have been the first subjected to this process—brass and iron not until some time later. White wire, or blanch iron wire, is mentioned in a list of articles not to be imported into England in 1463; and in 1484 both iron and latten (fine brass) wire are

WIRE CLOTH—WIRE GLASS

similarly named. Up to 1565 English iron wire was drawn by hand only, and was of so poor a quality that most of that used in the country, and also wool cards and other articles involving the employment of wire, were imported; and that in the year named patents were granted to manufacture wire in England.

The modern system of wire drawing is described under WIRE, MANUFACTURE OF.

In 1903 there were 29 wire mills in the United States giving employment to 10,000 persons. The amount of capital invested was \$4,242,173, and the total value of product was \$9,421,238. In the same year there were 597 wire working establishments, having an output valued at \$19,942,882. See STEEL MANUFACTURE.

Wire Cloth, a sieve-like fabric whose woof and weft are of wire; the size of the wire, the shape and sizes of the meshes, being adapted to the uses of the completed screen, sifter, or sieve, or the character of the machine in which it is to be used.

Wire Gauge, an instrument or mechanism for measuring the thickness of wire and sheet metals. It is usually a plate of steel having a series of apertures around its edge, each corresponding in width to the diameter of wire of a certain number.

Wire Glass, a modern invention used in building construction, being a combination of wire and glass. Wire glass is either ribbed,

fractured, but it will retain its place, and the perils incident to falling glass and the ingress or egress of draft and flame are avoided. Wire glass appeals to both the practical and the æsthetic in architecture. Practically it supplies the requisite light and ventilation as well as protection against fire, while it admits of a considerable saving in space, weight and cost. Æsthetically it is admissible to all window openings, because it obviates the necessity of cumbersome and unsightly hinged shutters, and the projecting lags and adjusters which support and secure them. Metal sashes fitted with wire glass are rustless, water-proof, durable, sanitary, noiseless in operation and as workable as ordinary window sashes.

The first attempts to introduce a metallic mesh into the body of the glass were for the purpose of increasing its strength and to prevent its falling apart when broken. In this respect the product has been thoroughly developed, but in addition it has proved to be one of the most remarkable fire retardants available for building purposes, and in view of the exceptional hazard attaching to window and skylight openings in all buildings, its uses as a fire retardant is outranking in importance as well as quantity, its other values. Many experiments have been made to develop different processes of manufacturing wire glass, but, owing to the inherent difficulties of maintaining the homogeneous quality of the glass, preventing damage from excessive heat to the wire and securing a practically central location of the wire in the body of the glass, only two methods have proved effective. One of these, known as the Shuman process, from the name of its inventor, Frank Shuman, of Philadelphia, consists of rolling a sheet of glass, laying the wire mesh upon the body of the glass, pressing the same into the glass instantly and while still plastic, and by a coincident process, smoothing over the slight abrasions made in the surface of the glass so as to secure a true and smooth surface on both sides of the glass. The other process known as the Appert process, from its inventor, Leon Appert, of France, involves the rolling of one sheet of glass, laying of the wire mesh upon this sheet and immediately and by a simultaneous and continuous process pouring and rolling a second sheet upon the top of the wire so as to completely imbed it and secure at the same time an absolutely solid single sheet of finished glass. Wire glass is now made in all the varieties known to the rolled glass process, including rough or hammered glass; ribbed glass, figured glass. Wire glass is also polished like plate glass, giving an entirely clear and transparent glass, and is largely used in fire-proof office buildings where there is any external exposure to fire.

The mechanical strength of plate glass is effectively increased by the introduction of the wire mesh, so that it will submit to much greater strains, and in fact one of its first purposes and effects was to eliminate the necessity for using in skylights one half inch glass, it having been proved that by using one quarter inch wire glass all the requirements were met, the breakage risk decreased and a very large factor of weight and expense in structural material eliminated.

WILLIAM DULLES, JR.,
Vice-Pres. Mississippi Wire Glass Co.

Wire Glass Fire-Proof Window.

rough rolled, polished plate or "maze," having wire netting imbedded in its centre during the process of manufacture. The temperature at which the wire is imbedded in the molten glass insures cohesion between the metallic netting and the glass, and the two materials become as one, so that if the glass is broken by shock, by intense heat or from other cause it remains practically intact. It combines the strength of the wire netting and the glass plate, and the wire is so thoroughly covered as to obviate the possibility of rust or corrosion. Wire glass will break, but it will not scatter. It can be

WIRE, MANUFACTURE

Wire, Manufacture of. At the present time all wire is made by the drawing process, and while permitting the production of a much thinner wire than could be obtained from the rolls, it also gives a wire of greater tensile strength, so much so that the smaller the size to which the wire is drawn down, the greater is its ultimate breaking strength. The wonderful strength of piano wire is well known. The breaking strength of English piano wire ranges from 225 pounds for No. 12 music wire, which is 0.029 inch in diameter, to 650 pounds for No. 22, which is 0.052 inch in diameter, indicating an ultimate tensile strength, ranging from 300,000 to 240,000 pounds per square inch. This wire is composed of carbon, 0.570; silicon, 0.090; sulphur, 0.011; phosphorus, 0.018; and manganese, 0.425.

In the past, all classes of iron wire were made entirely from wrought iron, and required very careful preparation of the raw material to insure toughness and high tensile strength; but, with the discovery of the Bessemer and the open-hearth converting processes, and the consequent lowering of the cost of production accompanied by an enormous increase in the strength of the raw material, wrought iron was quickly supplanted by steel. The great increase in the strength of steel wire over that of wrought iron may be better appreciated from the following statement of facts. The ultimate strength of the best bright hard-drawn wrought-iron wire is about 35 tons to the square inch, while that of ordinary Bessemer steel is 40 tons, and that of open-hearth steel is 60 tons to the square inch. In the special grades of wire manufactured from high carbon, open-hearth steel and from the best cast steel, the values range from 100 to 170 tons per square inch.

A description of the process of manufacture may be commenced with the billets. The bulk of the wire of commerce is made from Bessemer steel billets, while open-hearth billets are worked up into rods for the manufacture of chain, for special grades of wire, and for various finished products requiring great tensile strength. The billets are generally stored near the continuous heating furnaces located at the upper end of the rod mill. In the larger plants, when the mill is in full operation, four furnaces are continually at work, with a fifth held in reserve. The billets, which are 4 x 4 inches in section, and 36 inches in length, are fed into the furnace transversely, side by side, and are pushed through the furnace door by a hydraulic charging machine. After they have been heated to the right temperature for rolling, they are pushed out, one after the other, through the rear door of the furnace onto a conveyor which takes them to the rod mill, where they are passed through the roughing rolls. This mill consists of eight pairs of rolls, and by its operation reduces the billet from its section of 4 x 4 inches to a rod $\frac{3}{4}$ of an inch square and of great ultimate tensile strength. Each pair of rolls is placed at an increased distance from the one preceding, so as to allow for the increase in the length of the rod due to the decrease of the sectional area of the billet, and the alternate pairs of rolls are provided with different shaped grooves so as to press the rods into shapes alternately square and oval, oval and round, etc., thus working the metal thoroughly

and improving its qualities. In the eighth pair of rolls the grooves are $\frac{1}{4}$ of an inch square, and from them the rods are carried to the finishing mill where they are given ten more passes and brought down to the required dimensions.

The finishing mill lies at right angles to the roughing mill with its ten pairs of roll arranged side by side. As the rods issue from one pair of rolls, they are seized with a pair of tongs by workmen who bend them around and feed them into the next pair. The rapid increase in length is accommodated by the increased speed of the successive pairs of rolls, that of the tenth pair being about 1,350 feet per minute, or about 15 miles per hour. The entire operation of rolling down the billet to a finished rod $\frac{1}{4}$ inch square and about a quarter of a mile long, is accomplished in one heat. As the rods issue from the last pair of rolls, their ends are seized and attached to the drums of the Garret reels on which they are wound up into coils of convenient size, and then dropped onto a conveyor by which they are carried to the wire mill.

In the wire mill, the coils are thoroughly cleaned of scales, oil, and dirt by being placed in wooden tanks containing a weak solution of sulphuric acid. They are then taken out and hung up on a circular track, where they are allowed to remain long enough to oxidize slightly on the surface in order to permit a good grip upon the wire in the process of drawing. Further oxidation is prevented by placing them in a solution of lime, and then they are placed in the bakeries and dried out thoroughly. Up to this point the product is technically known as "rods," and only after it has been drawn down is it known under the commercial designation of "wire."

The wire drawing machine consists of a stout bench upon which is mounted a cast-iron drum, around which the wire is wound as it is drawn through the dies. The die-plates are heavy blocks of cast-steel, perforated with tapering holes exactly gauged to the desired size of the wire. In drawing, the coil of wire is placed on a spool fastened to the floor of the shop near the end of the bench, and the end of the wire having been swaged down, it is inserted in the larger end of the hole in the die-plate, passed through, and attached to the drum and wound up until the entire coil has been drawn down. Since the wire is drawn cold, the consequent strains are removed by placing the coils in the annealing pots, where they are carefully sealed with sand to exclude the air, and are then exposed to a steady heat for a period of eight or nine hours. Of the total finished product taken out of the annealing pots, a portion is ready for the market without any further treatment; a portion is galvanized; but the most of it is converted into wire nails and barbed wire. See NAILS, MANUFACTURE OF.

Barbed wire is manufactured in various patterns. The general process may be outlined by a brief description of the machine employed in making what is known as 2-point Glidden barbed wire. Four coils of wire on reels are placed behind the machine. The wire from two of the reels serves to form the strands, while that from the other two is used to form the barbs. The two strand wires, which are larger than the other two, are led between a

WIRE NAILS—WIRE ROPE

pair of friction wheels and pulled to a proper tension, and then crossed by the other two transversely, one on each side. At fixed intervals of a few inches, according to the desired spacing of the barbs, the two barb wires are caught by a pair of revolving fingers and twisted around one of the strand wires, and at the conclusion of the twist, two pairs of shears cut the ends of the barbs diagonally into sharp points. The wires then pass into a combined winding and twisting machine by which the two strand wires are twisted around each other, and then to the spool where it is wound up ready for the market. When once started, the operation of wire making is continuous and rapid, and the larger plants are capable of producing as much as 150 tons of barbed wire per day, while the total output of wire from the mills in the United States amounts to about 2,000,000 tons per year, of which about 500,000 tons are converted into wire nails. See also STEEL MANUFACTURE.

Consulting Civil Engineer.

Wire Nails. See NAILS.

Wire Rope, a variety of ropes of iron or steel wire extensively employed in raising and lowering apparatus in coal mines, as standing rigging for ships, as substitutes for chains in suspension bridges, and for telegraph cables. Endless wire ropes or cables are also used on traction railways, and in transmitting power over long distances where ordinary belting would prove unsuitable. Wire ropes were used in 1822 for a suspension bridge at Geneva, and for a similar structure of great span at Freiburg in 1835. A variety of machines are in use for making wire rope. The relative values of round ropes of iron, steel, and hemp are here tabulated:

Hemp		Iron		Steel		Breaking Strain
Diameter in inches	Weight per foot lbs.	Diameter in inches	Weight per foot lbs.	Diameter in inches	Weight per foot lbs.	
1 3/4	1.16	1 1/8	.75	3/8	.39	8
2 1/4	2.00	1 5/8	1.40	5/8	.62	14
2 9-16	2.66	1 1/2	1.80	3/4	.89	18
3	3.16	1 3/4	2.45	7/8	1.20	26
3 3/8	5.66	1 7/8	4.15	1 1/8	2.00	40

Dimensions and Durability.—In the United States the wire rope generally in use is composed of a hemp centre around which are laid six strands of 7, 9, 12, or 19 wires, thus forming a rope of either 42, 54, 72, or 114 wires. Ropes with seven wires are generally used for standing ropes, guys, transmission of power, etc. Ropes with nine wires are generally used for haulage ropes in mines, on inclines and for transmission of power. Those with 12 wires to the strand are generally used for ship-rigging and 19 wires for hoisting. Wire rope is as pliable as hemp rope of equal strength and therefore can be operated over sheaves and drums of the same size and is far more durable and efficient. Durability of wire rope depends principally upon the diameter of the sheaves or drums; the greater the size of the

sheaves or drums, the longer the rope will last. Experience has demonstrated that the wear increases with the speed. It is therefore better to increase the load than the speed. One fifth of the ultimate strength of rope is considered a fair working load. Wire rope must not be coiled or uncoiled like a hemp rope. When not on a reel, roll on the ground like a wheel or hoop to prevent twisting or untwisting. Galvanized rope should never be used for running rope. To preserve wire rope under water or under ground, add one bushel of fresh slacked lime to a barrel of mineral or pine tar—boil and apply hot. On incline planes the grooves of the pulleys or idlers should be lined with wood or babbitt metal. It is recommended to use as few idlers as possible. In a great many cases, they do more harm than good. For transmission of power the sheaves should be lined with leather or India rubber, to secure increased adhesion and prevent wear. The use of cast-steel rope is becoming general because of its lightness, greater strength and durability. To get the best results, steel rope should be made of the best quality of crucible cast steel. Ropes made from low grades of steel are inferior to iron ropes. The use of Bessemer steel in running ropes is not advisable. Ropes should be examined frequently and a new rope ordered before the old one is allowed to wear out. Attention to this will insure safety and prevent serious accidents.

Galvanized Steel Cables are largely used for suspension bridges and are composed of six strands with wire centre.

Diameter in.	Approximate circumference in.	Weight in pounds per foot	Approximate breaking strain in tons of 2,000 lbs.
2 3/4	8 5/8	12.7	310
2 5/8	8 1/4	11.6	283
2 1/2	7 7/8	10.5	256
2 3/8	7 1/2	9.50	232
2 1/4	7 1/8	8.52	208
2 1/8	6 5/8	7.60	185
2	6 1/4	6.73	164
1 7/8	5 7/8	5.90	144
1 3/4	5 1/2	5.10	124
1 5/8	5	4.34	106
1 1/2	4 3/4	3.70	90
1 1/8	4 1/4	3.10	75
1 1/4	4	2.57	62

Galvanized Steel Hawseers are usually 37 wires to the strand and combine great strength with pliability. The demand for towing a number of heavy loaded barges, practically in all kinds of weather, has called for a wire hawser stronger than any Manila hawser made. The two grades presented in the table—Cast-steel and Special—are made with a hemp centre and six strands of 37 wires each.

Approximate Diameter in.	Circumference in.	Weight per foot lbs.	Approximate breaking strain in tons of 2,000 lbs.	
			Cast-steel	Special
2	6 1/4	6.25	128	166
1 3/4	5 1/2	4.85	101	131
1 5/8	5	4.00	84	109
1 1/2	4 3/4	3.60	76	99
1 3/8	4 1/4	2.90	62	81
1 1/4	4	2.55	55	72
1 1/8	3 3/4	1.95	42	55
1	3	1.44	31	40

WIRE ROPE

Flattened Strand Ropes.—Instead of being made up of strands of circular form in cross-section, flattened strand ropes are constructed with strands, each of which has one or more flattened surfaces, so that one flattened surface is exposed on the outside of the full length of rope, with the result that a plurality of wires in each strand must at all times take the wear instead of there being only one external wire in peripheral working in each strand, as is the case with ropes of ordinary construction while new. Until the wear has greatly advanced and consequently a considerable diminution of strength has taken place in an ordinary rope, the friction is borne in a very marked manner upon the crown of the one wire nearest the periphery of the rope in each strand, and in cases where small wire is used it is rapidly worn through, while heavier wire has a tendency to fracture where the abrasion has taken place. Owing to the number of wires that are at all times exposed to wear in a flattened strand rope for a considerable distance along their respective lengths, a smooth or comparatively smooth surface is presented even while new, and the wear is consequently light upon any individual wire and the tendency to become brittle is minimized. These ropes are exceedingly flexible and are less liable to the crushing action which frequently takes place in other ropes. They are made up with the wires in the strands and the strands in the rope laid in the same direction or reversely. Owing to the comparatively little wear which takes place in these ropes, so large a margin between working load and breaking strain is not required as in ropes of ordinary construction. Flattened strand ropes are free from all tendency to spin or kink and a considerable saving in wear of pulleys and sheaves is effected by their smooth surface which is shown in the two following illustrations:

New.

Worn.

The end sections show a comparison of structure and wearing surface of round and flattened strand rope.

Hercules Wire Rope.—This is a very high grade of rope, the steel for which is specially prepared for it under a patent process and then

the wire tempered and drawn by a patent process, producing a steel strong and tough and that is uniform in density, texture, elasticity, elongation and strength, every wire being carefully tested for these points and the tests registered for reference. It is a rope that was evolved originally for use in extra hazardous places and where there is liability for rough usage.

Aerial Wire Rope Tramways.—Aerial tramways may be used to advantage both in operation and construction for transporting material from one place to another. This is especially true with ores, coal, stone, lime, rock, gravel, earth, sand, and cord wood. Packages, lumber, logs, light merchandise and water may also be transported economically. Usually the material is loaded on the cars at one terminal or an intermediate loading station and carried to the opposite terminal where it is discharged. By means of various devices it can be arranged for the discharging of the material at any point along the line for use in such work as constructing dams, carrying refuse from plants, etc. Aerial trams can be constructed in a hilly country without the necessity of making tunnels, cuts, embankments or bridges as compared to railway construction. Rivers and ravines are spanned while hills and other constructions are overcome by building the line directly over them and supporting it by towers or derricks at these points. Grades are no barrier to this construction as they can be built to surmount practically any grade and in fact where the loads are carried down grade and the grade is sufficient the entire tramway will be self-propelled, due to the forces of gravity. An aerial tramway is free from surface traffic, so that the underlying ground may be used for other purposes. Tramways are not affected by the elements, such as snow, sleet, rain or frost and may be operated irrespective of the weather.

There are two distinct classes of aerial tramways; namely, single rope systems and double rope systems. The single rope system is the simpler in construction of the two and for limited capacity not exceeding eight tons per hour, an average condition of route is economical in both construction and operation. This system consists of a moving endless rope to which are attached in various manners the carriers or buckets. The entire line is supported by sheaves placed on towers which are located dependent upon the profile of the ground. At each terminal the cable passes around a sheave or series of sheaves, generally one of them being provided with grips in its periphery for driving or controlling the tramway. When divisible material is carried, mechanical loaders are used and the buckets are arranged so that they discharge automatically. This is all accomplished while the line continues in operation. Bulky material can be loaded and taken away from the carriers while the tramway continues in motion, owing to its slow speed. The double rope system is always preferable to a single system owing to the fact that a separate track rope is used upon which the buckets travel instead of one cable performing the work of both supporting and propelling. This diminishes and divides the strains developed thereby, greatly increasing the life of the cable and plant. The double rope system will fulfil almost any requirements in the

WIRELESS TELEGRAPHY — WISCONSIN

tramway line and may be built practically any length. The practicability of long lengths of tramway is fully demonstrated by the tramway built for the North American Copper Company at Encampment, Wyo., which has a total length of over 16 miles and is built in four sections, making it the longest tramway in this country. The double rope system is capable of carrying capacities as great as 200 tons per hour and in fact even greater, when conditions demand it. The double rope system in general consists of two tracks or standing cables, upon which the loaded and empty carriers travel respectively and an endless traction rope for propelling them. The track cables are stretched at high tension, one end being anchored solidly and the other being fastened to a tension device. All of the cables are supported by towers, which are located according to the shape of the ground over which the line passes.

In all of the above classes, the traction rope passes around a sheave or a series of sheaves at either terminal; one, however, being generally provided with grips in its periphery for clamping the cable in order to secure the necessary friction for driving or controlling the tramway. In long lines, tension stations are provided for dividing the tension and take up on the track ropes. Double rope systems may be sub-divided into three classes. One in which the carriers are attached and detached to and from the traction rope by means of a friction or compressing grip. The second in which the carriers are permanent fixtures to the traction cable, the loading of same being effected by mechanical loaders while the buckets are automatically tripped at the discharging point. And the third in which the traction cable has permanent fixtures attached to it in the shape of clips or buckets. The buckets in this system are automatically attached and detached to and from same at either terminal of the line by means of a locking device. This latter system is furthermore designed so that the buckets are automatically discharged at the unloading end without any attendants to look after same. A simple tramway which is known as a two-bucket tramway may sometimes be used to advantage where the grade is steep and where the capacity is moderate. This is true for short lines. It consists of two cables stretched parallel to each other, upon each being operated a bucket, the two buckets connected to a traction rope which passes around a sheave or series of sheaves at the upper end of the line. When the loaded bucket descends by gravity, it pulls up the empty bucket on the opposite cable and vice versa. This type is sometimes used on level ground or even up-grade simply by applying power to the line for operating. The most suitable system of tramways to be used in any case depends upon the profile of ground, capacity, nature of material to be transported and terminal requirements and should be investigated thoroughly before deciding upon any particular construction.

Wirt, wért, William, American jurist and statesman: b. Bladensburg, Md., 8 Nov. 1772; d.

Washington, D. C., 18 Feb. 1834. He received a grammar school education, became a private tutor, studied law, was admitted to the bar in 1792, and commenced practice at Culpeper Court House, Va. In 1799 he removed to Richmond, was elected clerk of the house of delegates, and in 1802 received from the legislature the appointment of chancellor of the eastern shore of Virginia. In 1803 he published in the 'Richmond Argus' his 'Letters of a British Spy,' purporting to be papers left at an inn by an English member of Parliament traveling in Virginia. They consist principally of sketches of prominent public orators, with remarks on eloquence and some pages of local description, and proved extremely popular. A second series appeared in the following year in the 'Richmond Enquirer' under the title of 'The Rainbow.' Wirt was an assistant in the prosecution of Aaron Burr and in the course of the trial displayed a learning and eloquence which established his reputation as one of the foremost lawyers in the country. A series of papers somewhat in the style of the 'Spectator,' begun by him and several of his friends in 1810 under the title of 'The Old Bachelor,' appeared in 33 numbers of the 'Richmond Enquirer,' and afterward in book form. His 'Sketches of the Life and Character of Patrick Henry' appeared in 1817, and became immediately popular. In 1816 Wirt was appointed by President Madison attorney of the United States for the district of Virginia, and from 1817 to 1829 was attorney-general of the United States. On his retirement he passed the rest of his life in the practice of his profession at Baltimore. He delivered in 1826 in the hall of representatives in Washington a eulogy on Adams and Jefferson. In 1882 he was the candidate of the Anti-Masonic party for president of the United States. Consult: Kennedy, 'Memoirs of the Life of William Wirt' (1849); Trent, 'English Culture in Virginia' (1889).

Wiscasset, Maine, town, county-seat of Lincoln County, on the Sheepscot River, and the Maine Central Railroad; 40 miles northeast of Portland. It is in a region noted for picturesque scenery, and is a popular summer resort. It has a good harbor, and is a port for coasting vessels; some vessels are built here, and the town also contains a shoe factory and large saw-mills. There is a national bank, capital \$100,000, and a savings bank. It has several elementary schools, and a public academy (high school) founded in 1877. Pop. (1890) 1,733; (1900) 1,273.

Wisconsin, wís-kón'sín, a north-central State of the United States, sometimes called the "Badger State." Admitted to the Union 29 May 1848. It is between lat. 42° 30' and 47° N. and lon. 87° 30' and 92° 30' W. Bounded on the north by Lake Superior and the upper peninsula of Michigan, east by Lake Michigan, south by Illinois, and west by Iowa and Minnesota. The Mississippi and St. Croix rivers flow along the greater part of the western border. Its gross area is 56,040 square miles, or 35,840,000 acres. The State is divided into 71 counties. Its greatest length is 316 miles and breadth 295 miles. The State capital is Madison, and the leading manufacturing and commercial city is Milwaukee. The population in 1900 was 2,069,042.

WISCONSIN

Topography.—Wisconsin represents an elevated undulating plain with an altitude of from 600 to 1,800 feet above sea level. A ridge some 30 miles south of Lake Superior forms the watershed of the State, the ground sloping therefrom in all directions. High cliffs extend along the east shores of Green Bay and Lake Winnebago. The greatest depression in the State is the surface of Lake Michigan, 578 feet above the sea. The Mississippi River at the mouth of the Platte, eight miles above Dubuque, is 591 feet; at Prairie du Chien, 602; at La Crosse, 632; and at the mouth of the St. Croix, 677—it therefore has a descent in this part of its course of 5 inches per mile. The descent of Fox River from Lake Winnebago to Green Bay is 170 feet, forming one of the most valuable series of water powers in the West. No part of the United States excels the valley of the upper Mississippi in the great beauty of its bluff and woodland scenery.

Rivers and Lakes.—The Mississippi River forms the western boundary of the State for about 250 miles, and in that distance receives the waters of the Wisconsin, Black, Chippewa, and Saint Croix, all large streams, draining respectively areas of 11,000, 2,200, 9,000 and 3,600 square miles. The other principal rivers are the Rock, another tributary of the Mississippi; the St. Louis, Bois Brulé, Bad, and Montreal, flowing into Lake Superior; the Menominee, Peshtigo, Oconto, Pensauckee, and Fox, with its tributary the Wolf, flowing into Green Bay; and the Manitowoc, Sheboygan, and Milwaukee, tributaries of Lake Michigan. Innumerable smaller streams irrigate almost the whole surface; their waters are usually clear, originating in springs and small lakes. Several of these at the north are precipitated over rocky barriers, forming often beautiful cascades or rapids; and at the south several run through narrow rocky gorges called "dalles." The Mississippi is navigable for steamboats throughout its course along the border of the State; the Wolf and Fox rivers are navigable for small steamboats, the latter having been artificially improved with slack-water dams; and many of the streams afford ample water power for manufacturing purposes. Besides the two great lakes, Superior and Michigan, there are numerous others, especially in the central and northern portions of the State; these are from 1 to 20 or 30 miles in extent, often with high, picturesque banks, and deep water, abounding in fish. The largest lake in the State is Winnebago, 28 miles long and 12 miles wide, covering an area of 212 square miles. The other principal lakes are Saint Croix, Pepin, Little and Great Butte des Morts, Mendota, Monona, Waubesa, Kegonsa, Puckaway, Pewaukee, Geneva, Green, and Koshkonong.

Climate.—The mean annual temperature of the southern portion of the State is 46° F.; mean temperature of winter 20°; of spring and autumn 47°, and of summer 72°. The waters of Lake Michigan materially affect the temperature of the counties along its shores, moderating both the excessive heat of summer and the cold of winter; and hence the temperature of January at Milwaukee is found on the Mississippi River half a degree of latitude farther south, and that of July at Saint Paul, 2° farther north. The northern part of Lake Michigan is generally covered with ice in the winter, but the sheet

seldom reaches as far south as Milwaukee, where navigation generally continues open during the entire year. Snow almost always falls in the northern part of the State before the occurrence of heavy frosts, protecting the ground and the roots of plants from freezing, and from its melting accelerating the growth of vegetation in the spring. The prevailing winds of spring are from the N. E.; of summer, S. E.; of autumn and winter, W. The winters are cold, mostly uniform, with many clear, dry days; the springs are backward; the summers short and often hot; the autumns prolonged, mild, and usually pleasant. The annual quantity of rain and melted snow is about 32 inches. The barometer varies in its extremes from 28 to a little above 30 inches, the mean being about 29.5.

Geology.—The rock formations present in the State of Wisconsin begin with the very oldest, the Archæan, and extend up to the Devonian, which is represented by a small area near the city of Milwaukee. The Archæan rocks occupy a dome-like area in the north-central part of the State, mantled about by the sandstones, shales, and limestones of the Cambrian and Silurian age. The Archæan rocks consist of granite, greenstone, gneiss, schist, quartzite, and crystalline limestone. The Cambrian and Silurian rocks have their beds sloping in all directions away from the central Archæan area. Within the Silurian rocks the Trenton and Niagara formations are filled with fossils. In addition to the large central area of Archæan rocks, a smaller area is found forming the elevated area of bluffs near the town of Baraboo. The later beds of the Archæan formation are rich in minerals, particularly those containing copper and iron. In the southwestern part of the State the Silurian formations are important by reason of the areas of zinc and lead which they contain.¹

Minerals.—The mineral resources of the State are very extensive. Lead, copper, iron, and zinc occur abundantly and are mined with profit. The principal mineral productions in 1900 included red hematite, 733,212 long tons; brown hematite, 12,793 long tons; granite valued at \$407,711; sandstone, \$81,751; limestone, \$989,685; clay products, \$1,811,712; coke, 48,000 short tons, valued at \$240,000; and mineral water valued at \$1,261,312. The lead mines of the State were first discovered by the French, in the middle of the 17th century; but attracted little attention until 1826, from which time the quantity of lead produced increased rapidly, until the discoveries in the Black Hills overshadowed the importance of the Wisconsin mines.

Agriculture.—Nearly 60 per cent of the land area of Wisconsin is included in the farms of the State. There were 169,795 farms in 1900. Much of the northern part was until recently covered with extensive forests of white pine, balsam, hemlock, and other cone-bearing evergreens, but these have suffered serious diminution from lumbering operations. The soil in the north is, in large measure well adapted to agriculture, although there are large sandy tracts only suited to the growth of pine forests; the prairies in the south and central portions are exceedingly rich and productive, raising the cereals, tobacco, sugar beets, and potatoes in great quantities.

¹ This paragraph is by Prof. William H. Hobbs, of the University of Wisconsin.

WISCONSIN

According to the somewhat uncertain census returns, the principal farm crops in 1900 were corn, 547,240 bushels, valued at \$16,350,589; wheat, 13,166,599 bushels, valued at \$8,426,623; oats, 61,971,552 bushels valued at \$14,253,457; barley, 6,259,179 bushels, valued at \$2,754,039; rye, 3,010,437 bushels, valued at \$1,475,114; buckwheat, 385,462 bushels, valued at \$227,423; potatoes, 15,619,641 bushels, valued at \$4,373,499; and hay, 1,218,354 tons, valued at \$11,757,116. The average values per acre of the principal crops are as follows: Flowers and plants, \$1,396; onions, \$125; nursery products, \$116; tobacco, \$86; small fruits, \$67; miscellaneous vegetables, \$54; hops, \$53; broom corn, \$39; sweet potatoes, \$25; potatoes, \$23; dry beans, \$16; flaxseed, \$13; dry peas, \$12; cereals, \$9; hay and forage, \$8; and orchard fruits, \$5. The crops yielding the best average returns per acre were grown upon highly improved ground. Their production required a relatively great amount of labor, and large expenditures for fertilizers.

The value of all livestock on farms in 1900, was \$96,327,649. Of this amount 35.6 per cent represents the value of horses; 30.8 per cent dairy cows; 17.8 per cent other neat cattle; 7.9 per cent swine; 4.7 per cent sheep; 2.5 per cent poultry; and .7 per cent that of all other livestock. Dairying is an important branch of agriculture in Wisconsin. In 1900 the value of dairy products was \$26,779,721, being 17 per cent of the value of all farm products. Of this amount, 78.6 per cent represents the value of dairy produce sold, and 21.4 per cent that consumed on the farms of the producers. Of the former amount, \$15,717,043 was received from the sale of 252,450,051 gallons of milk; \$4,508,775 from 26,931,757 pounds of butter; \$686,629, from 1,638,601 gallons of cream, and \$135,938, from 1,558,575 pounds of cheese.

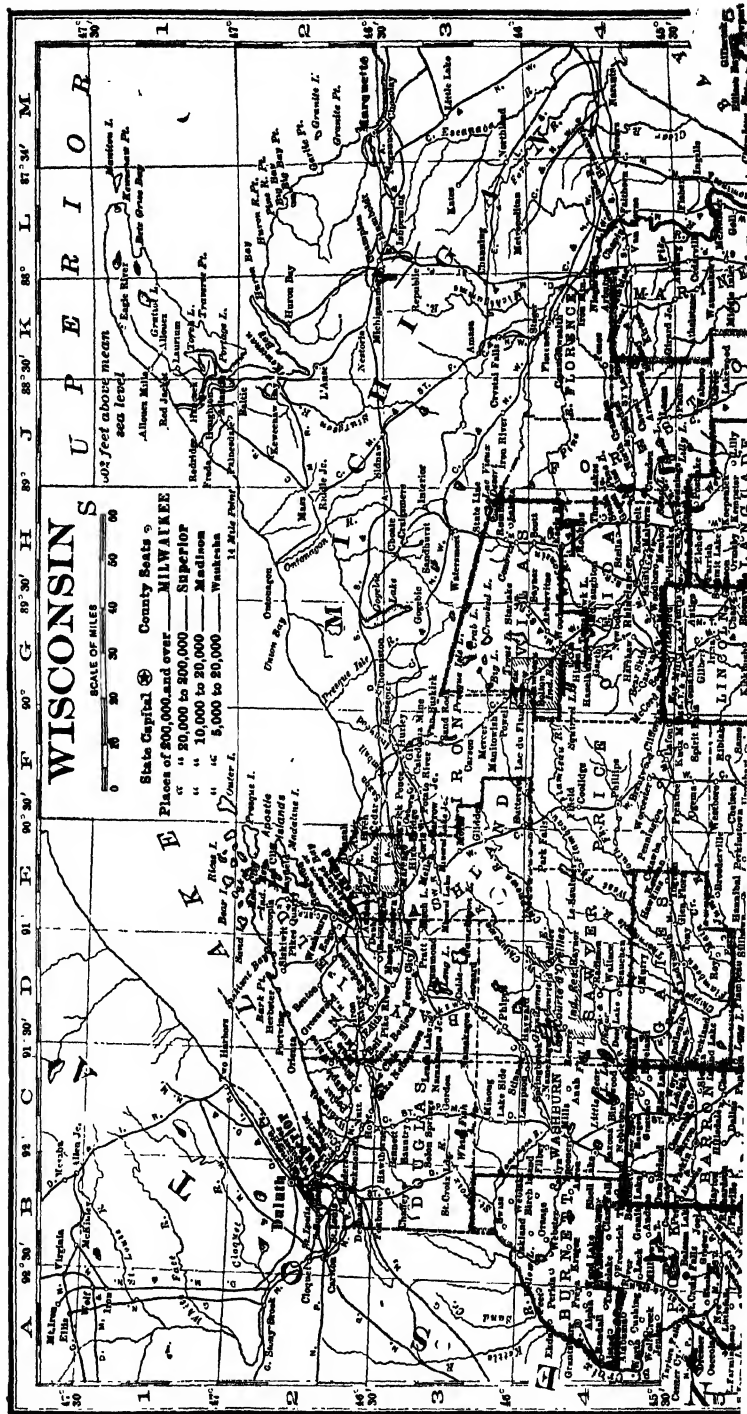

Manufactures.—In 1900 Wisconsin had 16,187 manufacturing establishments, employing \$330,568,779 capital and 152,836 persons; paying \$69,015,980 for wages and \$208,838,167 for materials; and having an aggregate output valued at \$360,818,942. The principal manufactures, according to the values of output, were: lumber and timber, \$57,634,816; flour and grist, \$26,327,942; foundry and machine shop products, \$22,252,730; cheese, butter, and condensed milk, \$20,120,147; leather, \$20,074,373; malt liquors, \$19,394,709; packed meat, \$13,601,125; and paper and wood pulp, \$10,895,576. The iron output aggregated over 116,000 tons of pig-iron and 60,000 tons of rolled iron. Manufactures of leather amount to \$9,000,000; and beer is produced, chiefly at Milwaukee, to the value of \$11,000,000 annually. The remarkable growth of manufactures in Wisconsin is to be attributed to an abundant supply of materials and excellent market facilities. Manufacturing is not concentrated in a few localities, but is well distributed throughout the State. Six large rivers—the Menominee, Saint Croix, Chippewa, Wisconsin, Rock, Fox, and Wolf—with many smaller streams, and the outlet of many of the 2,000 fresh-water lakes in the northern part of the State, afford enormous water power, as yet only partially developed. On the shores of Lake Michigan and Green Bay are 11 important manufacturing cities, all accessible to lake-going vessels; and the cities of Ashland and Superior, on

Lake Superior, are large and growing manufacturing centres. Wisconsin in 1900 was the first among the States in the value of its timber and lumber products; Michigan, which was first in 1890, having suffered a much greater decline. But so rapid has of late been the work of the lumbermen, that Wisconsin's lumber industry is fast dropping to a much lower stage, the principal operators having already withdrawn from the State to the South and far Northwest. Most of the timber has been removed from the southern part of the State, yet in the north there is still much pine, hemlock, spruce, and deciduous varieties. During the year 1900 there were produced 3,389,166,000 feet of sawed lumber. The manufacture of flouring and grist-mill products ranked second among the industries of the State in 1900, with 717 establishments, 1,412 wage-earners, and products valued at \$26,327,942. In 1890 there were 497 establishments, 1,770 wage-earners and products valued at \$24,252,297. The increase in the value of products during the decade was \$2,075,645. There were 47 establishments engaged in the manufacture of paper and wood pulp in 1900, with 4,240 wage-earners, and products valued at \$10,985,576. In 1890 there were 27 establishments, 1,779 wage-earners, and products valued at \$4,475,368. The increase in the value of products during the decade was \$6,420,208. These mills are situated mainly on the large rivers which afford the abundant power so essential to the successful conduct of this industry. The large quantities of spruce, hemlock, and other woods used are furnished by the forests of the State, and the quality of the water is unexcelled for paper-making purposes. There were 78 establishments engaged in the manufacture of furniture in 1900, with 7,775 wage-earners, and products valued at \$8,721,823. In 1890 there were but 46 such establishments, 2,909 wage-earners, and products valued at \$3,616,517. The increase in the value of products during the decade was \$5,105,306.

Transportation.—The first railroad in Wisconsin was built in 1850. In 1904 the principal railroads traversing the State were the Chicago and Northwestern; the Chicago, Milwaukee and Saint Paul; the Wisconsin Central; the Chicago, Saint Paul, Minneapolis and Omaha, and the Minneapolis, Saint Paul and Sault Sainte Marie. The total length of railroads within the State in 1902 was 6,970 miles.

Banks and Banking.—In the State in 1902 there were 96 national banks in operation, having \$10,573,710 in capital; \$5,009,180 in outstanding circulation; and \$4,284,620 in United States bonds. There were also 151 State banks with \$6,824,725 capital, and \$1,131,559 surplus; 138 private banks, with \$1,154,322 capital; and one mutual savings bank, with \$634,236 in savings deposits. The exchanges at the United States clearing house at Milwaukee, during the year ending 30 Sept. 1901 aggregated \$315,787,647, an increase over those of the preceding year of \$17,763,054.

Government.—The government of the State is in accordance with the constitution adopted 18 February, and ratified by a vote of the people 14 March 1848. By it certain personal rights are secured to every citizen, adequate remedies for wrongs secured, the crime of treason clearly defined, leases of land for agricultural purposes longer than 15 years prohibited, and aliens al-

WISCONSIN

lowed to hold and convey property; all white male citizens and persons who have declared their intention to become citizens, who are 21 years of age and who have resided in the State one year, have the right to vote. The governor is elected for a term of two years, and receives a salary of \$5,000 per annum. Legislative sessions are held biennially in odd-numbered years, beginning on the second Wednesday in January, and there is no limit to length of session. The Legislature has 33 members in the Senate and 100 in the House, each of whom receives \$500 per biennial period and mileage. There are 11 representatives in Congress. The State government in 1904 was Republican. There is a supreme court of six members elected for 10 years.

State Finances.—In 1902 Wisconsin had no indebtedness except for the following trust funds: School fund, \$1,563,700; normal school fund, \$515,700; university fund, \$111,000; agricultural college fund, \$60,600; total, \$2,251,000. The assessed valuation in 1900 was: Real estate, \$503,690,767; personal property, \$126,309,233; total, \$630,000,000; State tax rate, \$2.136 per \$1,000; and total taxes raised, \$1,345,570. The receipts for the year 1902 were \$5,321,304; expenditures, \$5,124,553; balance in the State treasury, \$496,408.

Charities and Correction.—The penal and charitable institutions are managed by a State board of control, appointed by the governor. The incurable insane are cared for in county asylums, supported both by the State and county. There are State insane hospitals at Mendota and Winnebago; a School for the Blind at Janesville; Home for the Feeble-Minded at Chippewa Falls; School for the Deaf at Delavan; Industrial School for Boys at Waukesha; and State School for Dependent Children at Sparta. The State Prison is at Waupun, and the State Reformatory at Green Bay.

Education.—In 1900 the children of school age in Wisconsin numbered 618,290; the enrollment in public schools, 444,521; the average daily attendance, 309,800. There were 7,242 public school buildings, public school property valued at \$17,630,000, and 13,063 teachers. For higher education there were 183 public high schools, 25 private secondary schools, 7 public and 2 private normal schools, 10 universities and colleges for men and for both sexes, and the Milwaukee-Downer College for Women, at Milwaukee. The principal colleges include the University of Wisconsin (q.v.), at Madison; Beloit College, at Beloit; Marquette and Concordia Colleges, at Milwaukee; Lawrence University, at Appleton; Northwestern University, at Watertown; Ripon College, at Ripon; Milwaukee Medical College and Wisconsin College of Physicians and Surgeons, at Milwaukee.

Religion.—The strongest denominations in the State are the Roman Catholics; Lutheran, Independent Synods; Methodist Episcopal; Congregational; regular Baptist; Evangelical Association, German Evangelical Synod; and Presbyterian. In 1900 there were 6,768 Evangelical Sunday-schools, with 22,880 officers and teachers, and 447,497 scholars.

Population.—Soon after the admission of Wisconsin to the Union in 1848 efforts were made to attract immigration by the offer of cheap lands, and the result has been an unusually large foreign element in the population—

chiefly German and Scandinavian, but including also French, Swiss, and most other European peoples. Many of these foreigners settled in communities, some of which have tenaciously preserved their original language and customs. The population in the State in 1830 was 3,245; (1840) 30,945; (1850) 305,391; (1860) 775,881; (1870) 1,054,670; (1880) 1,315,497; (1890) 1,686,880; (1900) 2,069,042, including 1,657 Indians. There are also about 6,000 tribal Indians living on Federal reservations. The leading cities in the State in the order of their population are as follows: Milwaukee, 285,315; Superior, 31,091; Racine, 29,102; La Crosse, 28,895; Oshkosh, 28,284; Madison, 23,000; Sheboygan, 22,962; Green Bay, 18,684; Eau Claire, 17,517; Marinette, 16,195; Fond du Lac, 15,110; Appleton, 15,085; Janesville, 13,185; Ashland, 13,074; Wausau, 12,354; Manitowoc, 11,786; Kenosha, 11,606.

Indian Reservations.—The Indian reservations in Wisconsin are La Pointe, Menominee, Oneida, and Stockbridge. The Stockbridge are self-supporting, largely through annuities and sales of lumber-cutting rights, but take little interest in agriculture. The Menominee and Chippewa, on the Menominee and La Pointe reservations, respectively, also derive most of their support from the sale of their timber. The Menominee are dependent upon Government rations for 20 per cent of their subsistence. La Pointe, or Bad River, reservation, is situated in Ashland county, and comprises an area of 194 square miles. These Indians are a portion of the Lake Superior band of Chippewa (Algonquian) with a population of 627. The Menominee and Stockbridge reservations, embracing areas of 362 and 18¼ square miles, are located in Shawano and Oconto counties. The Menominee (Algonquian) are an aboriginal Wisconsin tribe and have a present population of 1,487. Their principal occupations are lumbering and farming. The Stockbridge and Munsee tribes, of Algonquin stock, originally lived in New England; later they moved to western New York, and thence to Wisconsin; they are non-consolidated, and number 376. The Oneida reservation, now existing as such only in name, is situated in Brown and Outagamie counties. The entire area, 102 square miles, has been allotted, with the exception of a small tract for school purposes. The Oneida (Iroquoian) were formerly a portion of the Six Nations of New York, where they resided before being sent to Wisconsin. Their present population is 1,704. In Calumet County are many Stockbridge, Brothertown, and Munsee farmers, without tribal relations, and following the pursuits of husbandmen. There are nearly 8,000 Indians and half-bloods in the State, either as citizens or in tribal relations—as large a number as at any period in its history.

History.—The region west of Lake Michigan was first visited by French explorers. Jean Nicolet, an agent of Champlain, arrived in 1634. In 1658-59 two fur traders, Radisson and Groseilliers, visited the Mississippi and the former wrote a journal of their travels. In 1665 a Jesuit mission at La Pointe was founded by Father Claude Allouez, and three years later he established the mission of St. Francis Xavier on the shores of Green Bay. In 1673 Father Jacques Marquette, accompanying Louis Jolliet,

WISCONSIN

reached the Mississippi by passing through Wisconsin; and later Duluth, Father Louis Hennepin, the famous La Salle, and other Frenchmen traced waterways within the territory. Trading posts were established about this time, becoming dependencies of Mackinac. The earliest explorers found the Chippewa on the borders of Lake Superior, at war with the Sioux, on the headwaters of the Mississippi. The Menominee, Winnebago, Mascouten, Miami, Pottawatomi and Kickapoo occupied other portions of the same district. At a later period the Pottawatomi and the Sauk and Foxes were in possession. Artificial earth-mounds (see MOUND BUILDERS), in the form of animals, such as the lizard, bird, turtle, and buffalo, are still to be found in various parts of the State. The navigation of the upper lakes was begun in 1679, when La Salle's "Griffon" made a trip from Niagara River to Green Bay, and was lost on her return voyage. About 1750 a fixed settlement was established at Green Bay by Charles de Langlade; and at the close of the Revolutionary War, Prairie du Chien, at the mouth of the Wisconsin, grew into a like settlement; a few years later La Pointe (at first on the mainland, but soon thereafter on Madeleine Island, in Chequamegon Bay) and Portage became permanent trading posts. England retained Mackinac after the treaty of 1783, and American dominion was not felt by the Wisconsin traders until after the War of 1812-15. The formation of Astor's American Fur Company to establish fur trade in this region was followed by a law forbidding English traders within the territory, which resulted in an increase of American influence. By the ordinance of 1787 Wisconsin became a part of the Northwest Territory. In 1800 it was included in Indiana Territory. In 1809 the region was annexed to the territory of Illinois, as then formed, and so continued till the conversion of the latter into a State in 1818, when Wisconsin, which was yet a wilderness, was annexed to Michigan Territory for such government as was needed. In 1826 lead was discovered in large quantities at Potosi and Mineral Point, and there was a great rush of immigrants to that section. The Indians soon became troublesome, and the Black Hawk war ensued in 1832. Treaties were a few years later made with the Indians, by which most of them removed to reservations beyond the Mississippi. In 1836 the population had increased to such an extent that a territorial government was organized, which at first included a part of the upper peninsula of Michigan, the whole of Minnesota and Iowa, and that part of the Dakotas lying east of the Missouri and White Earth rivers. On the admission of Michigan into the Union as a State, a part of the Lake Superior region was set off to her, and when the Territory of Iowa was formed, it included all the region west of the Mississippi; later, the territory west of the St. Croix was given by Congress to Minnesota. The first effort to procure the admission of Wisconsin to the Union as a State was made in 1846. A constitution drafted during that year was ratified in March, 1848, and the State was admitted to the Union by Act of Congress, 29 May 1848. Under this constitution, with some amendments, it is still governed. During the War of Secession the

State furnished 91,327 soldiers to the Federal Army.

Bibliography.—Wisconsin Historical Collections, 17 vols. (1854-1904); Parkman Club Publications (1896-7); Butterfield, 'Discovery of the Northwest' (1881); Hebbard, 'History of Wisconsin Under the Dominion of France' (1890); Lapham, 'Wisconsin' (1846); Smith, 'History of Wisconsin' (1854); Strong, 'History of the Territory of Wisconsin' (1885); Thwaites, 'Story of Wisconsin' (1890 and 1899); and 'Stories of the Badger State' (1900); 'Historic Waterways' (1888 and 1903); Legler, 'Leading Facts in the History of Wisconsin' (1898); and various monographs published by the State Historical Society.

Revised by R. G. THWAITES.

Wisconsin, a river in the State of Wisconsin. It has its rise in Vieux Desert Lake, on the northern boundary of the State, flows south to Portage City, then southwest, and enters the Mississippi four miles below Prairie du Chien, Total length about 625 miles. It is navigable for 200 miles to Portage City, from which point it is connected with Fox River by a canal. Shifting sandbars in this river are a hindrance to navigation. There are several waterfalls along its course, the most famous of which are known as The Dalles of Wisconsin and Grandfather Bull Falls. Some of the bluffs which line the picturesque gorges are fully 400 feet high.

Wisconsin Phalanx. See RIFON, WIS.

Wisconsin, University of, the State University located at Madison, Wis. As early as 1836 the legislature of the territory then known as Wisconsin passed an act for the establishment of "Wisconsin University" at Belmont, now in the State of Iowa, but the institution was never organized; again in 1838 a law was passed for the establishment of the "University of the Territory of Wisconsin," a board of visitors was appointed, and the national endowment of two townships of land received. Nothing further was done, however, until 1848, when the State Constitution provided for the establishment of a State university, and the university was incorporated by act of the legislature. A preparatory department was opened in 1849, and the collegiate department in 1850. In 1854 a second grant of two townships of land was made by Congress; but this land as well as that of the first grant was sold at very low prices to attract settlers, and the income derived from the fund was meagre; no State appropriation was made till 1870. In 1858 the University was reorganized, the work of the preparatory department restricted, and the collegiate department organized in six schools; during the War of Secession a large number of students entered the army, and though the work of the university was not suspended, no commencement was held in 1864. Since the war the progress of the university has been continuous. In 1866, a reorganization was effected. The Federal grant under the "Morrill Act" for the establishment of colleges of agriculture and industrial arts was given to the university. Colleges of agriculture and engineering were then established as integral parts of the university. Women, who had been admitted since 1863 to a "normal" department, were given the opportunity to follow a regular collegiate course. At this time, however, the co-educational system was not

WISCONSIN

complete as the work of the women was kept separate from that of the men; but a few years later complete co-education was established. In 1873 the legislature appropriated \$10,000 a year to the university; in 1876 an annual tenth of a mill tax was appropriated; in 1883 and 1891 other mill taxes were added; in 1899 all mill taxes were consolidated with a grant of one per cent of the railroad licenses into a specific annual grant, which was increased in 1901 and again in 1903. The total income from all sources was \$674,000 in 1902-3. At the time of the first annual grant of \$10,000 a system of free tuition to graduates of high schools in the State was adopted, which led to the elimination of the preparatory department a few years later. This also resulted in making the university the actual head of the public school system of the State.

Since 1892 the university has extended its work in all directions; a number of special courses have been added, particular emphasis has been laid on graduate work, and the number of graduate students increased. The university now includes the following colleges and schools: (1) the College of Letters and Science; (2) the College of Mechanics and Engineering; (3) the College of Law; (4) the College of Agriculture; (5) the Graduate School. It also conducts a summer school and a university extension department. The College of Letters and Science includes beside the general departments of instruction in arts and science, the several special departments as follows: The courses in commerce, pharmacy, education, and home economics, the School of Music, the pre-medical course, the normal graduates' course, and the Washburn Observatory. The degree of A.B. is conferred upon the graduates of the College of Letters and Science, except in the pharmacy and normal graduate courses; for this degree the work is largely elective; in the Freshman year an English course is required, and during this year the other studies are elected from two groups, (1) language, (2) mathematics, science, and history. Certain minima in these groups must be offered, the total covering somewhat less than two years' work. Not later than the beginning of the Junior year a major subject in some one department must be elected, and the remainder of the work is free electives. A limited amount of elective work may be taken in the colleges of Engineering and Agriculture, in the School of Music, or in the special courses of the College of Letters and Science. A special two years' course is arranged for normal school graduates, for completion of which the degree of Ph.B. is conferred. The special courses in pharmacy cover four years, leading to the degree of B.S., or two years, leading to the degree of Graduate in Pharmacy. The College of Engineering was organized in 1870; it offers six four years' courses leading to the degree of B.S.; these are in civil, sanitary, mechanical, electrical, and general engineering, and applied electrochemistry; the course in general engineering includes an elective course in mining engineering. The College of Agriculture offers a "long course" of four years, leading to the degree of B.S., a short course of two years, winter and summer dairy courses, and a farmers' winter course; this college also includes the Agricultural Experiment Station and the organization of farmers' institutes. The College

of Law was established in 1868; it offers a three years' course leading to the degree of LL.B. The Graduate School received its present organization in 1895. It includes work in the College of Letters and Science, the College of Engineering, and the College of Agriculture, courses especially for graduate work being offered in each department of these colleges; the school as a whole is under the control of a faculty committee. The degrees conferred are A.M., M.S., Ph.D., C.E., E.E., and M.E. The Summer School offers courses in the subjects of the general college curriculum, in education, in gymnastics, and a special normal course; it also includes a summer school in shop and laboratory work for mechanics. Tuition in the university is free to Wisconsin students except in the College of Law. There are eight scholarships for undergraduates, and four student loan funds; there are also 31 fellowships, five of which are in special departments, and 18 graduate scholarships, six of which are for special purposes.

Gymnasium work and military drills are required of men students during part of the course, and gymnasium work of women students. There is also ample provision for athletic sports, which are under the general control of an Athletic Council, on which the faculty is represented. The University of Wisconsin is the only institution of the kind in the West which has a boat crew. The women students have organized an athletic association. The students maintain four men's literary societies and one women's society in the College of Letters and Science, and two debating societies in the College of Law; the four men's societies and the two law societies form the intercollegiate debating society from which debaters for intercollegiate contests are chosen; two of the men's societies and the women's society were organized in the early days of the university, and have always had a prominent part in student life. There are also a Science Club, dramatic clubs, and numerous other special associations, a Woman's Self-Government Association, and chapters of the honorary fraternities of Phi Beta Kappa and Tau Beta Phi (engineering). The university campus contains about 450 acres, bordering on the south shore of Lake Mendota; in the eastern part of the grounds, the land rises abruptly in two hills, of which the eastern and higher is known as University Hill. On this hill are most of the college buildings; the Washburn Observatory stands on the western hill, which is known as Observatory Hill; further west is the farm with its barns and buildings; to the east of University Hill is the Lower Campus, used largely for athletic sports; the State Historical Society Library Building, containing the libraries of the society and the university, also stands at the western end of this campus. Among the prominent buildings on and near University Hill are North Hall, South Hall, and University Hall, Chadbourne Hall, Assembly Hall, Science Hall, and the Engineering Building; on and near Observatory Hill are the Hiram Smith Hall (dairy), the Horticultural-Physics Building, and the new Central Agricultural College (completed in 1904). The University Library in 1904 contained 86,000 volumes; in addition to which there are departmental libraries, the State Historical Library, and other libraries open to students. The State

WISDOM — WISE

Historical Library and the University Library are in one building, practically on university ground, and although they are administered by separate staffs, are in effect one library for the use of students. Thus there are about 250,000 bound volumes and half as many pamphlets accessible for the purposes of the university. The collection is particularly strong in American and English history, Greek, political and social science, Shakespeare, and the publications of American learned societies. The students in 1904 numbered 3,227, of whom 1,312 were in the College of Letters and Science, 744 in the College of Engineering, and 525 in the College of Agriculture. The University of Wisconsin ranks among the first of the State universities both in numbers and in standard of scholarship.

H. B. LATHROP,
Associate Professor of English Literature, University of Wisconsin.

Wisdom, Book of, the name of one of the so-called apocryphal books of the Old Testament. See **WISDOM OF SOLOMON**.

Wisdom of Solomon, a book regarded by Protestants as apocryphal, but accepted by Roman Catholics as part of the canon of the Old Testament. It purports to be the work of Solomon, but the Protestant view is that it was the composition of a Jew of Alexandria about a century before Christ. The author states that he is a king and the son of a king, that he prayed to God for wisdom, and received both wisdom and riches. God directed him to build a temple on the holy mount. Righteousness and wisdom are commended, and unbelievers and idolatry are denounced, and examples are given from the Mosaic writings to show how the judgments of God overtake the worshippers of false gods, and the wicked generally. Nor is the author content with indicating earthly penalties for wrongdoers. He points plainly to rewards in a future life for the good, and punishments for the wicked, and without referring to the resurrection of the body, he teaches the immortality of the soul. The book was highly esteemed among the Jews, and was evidently well known to St. Paul, as the epistles to the Romans, the Corinthians, and Ephesians indicate. Under the name of 'Wisdom' in the Roman Catholic canon of the Old Testament, the book is in the list recognized by the Council of Trent as inspired Scripture. The Roman Catholic position is that it was truly the work of Solomon, and that the Alexandrian Greek version was a translation from the original Hebrew.

Wise, Daniel, American Methodist clergyman and author: b. Portsmouth, England, 10 Jan. 1813; d. Englewood, N. J., 1898. He came to the United States in 1832, entered the Methodist ministry, edited the 'Sunday School Messenger' 1838-43, and 'Zion's Herald' 1852-6, as well as many Sunday School publications. He published more than 50 books for young people, mostly under the pen-names of 'Francis Forrester' and 'Laurence Lancewood.' Among these are: 'Personal Effort' (1841); 'Life of Ulric Zwingli' (1850); 'My Uncle Toby's Library' (12 vols. 1853); 'Vanquished Victors' (1876); 'Heroic Methodists' (1882); 'Boy Travelers in Arabia' (1885); 'Men of Renown' (1886); and 'Some Remarkable Women' (1887).

Wise, Henry Alexander, American lawyer and political leader: b. Drummondtown, Accomac County, Va., 3 Dec. 1806; d. Richmond, Va., 12 Sept. 1876. He was graduated from Washington College, Pa., in 1825, was admitted to the bar in 1828, and began the practice of law at Nashville, Tenn. In 1830, however, he returned to Accomac County, where he built up a large practice as a lawyer. He was early active in the Democratic party; was a delegate to the national convention of 1832, and in the same year was elected to Congress. After the election, he fought a duel with his opponent, on the latter's challenge. On the removal of the government deposits from the United States bank, Wise, with other Democrats in the House, joined the Whigs in opposition against President Jackson. He was, however, re-elected to Congress in 1834 and in 1836; and also opposed Van Buren's banking and sub-treasury plan. In 1837 he acted as the second of Graves, of Kentucky, in a duel with Cilley, of Maine, both members of Congress, in which the latter was killed. This occurrence led to much denunciation of Wise, who was, however, ascertained not to be responsible for the affair. In 1840 he was instrumental in securing the nomination of Tyler for the vice-presidency, and after Tyler became President exerted an important influence on the administration policy. In 1844 he was appointed minister to Brazil; and on his return to the United States in 1847, again gave his support to the Democratic party. In 1854 he was Democratic candidate for governor of Virginia, conducted an active campaign, particularly against the Know Nothing party, and was elected by a majority of 10,000. Toward the end of his term as governor occurred the seizure of Harper's Ferry by John Brown and his followers, and the execution of John Brown at Charlestown, 2 Dec. 1859, was one of the last acts of his administration. He was a member of the State convention which met at Richmond in 1861 to consider the relations of Virginia to the Federal government, and one of the committee on Federal relations to whom the principal business of the convention was referred. He favored a compromise between North and South, and the avoidance of hostilities if possible; but after Virginia declared for secession he loyally supported the Confederate cause. He was appointed a brigadier-general in the Confederate army, and occupied the Kanawha Valley; but was rapidly driven out by Gen. Cox, in a series of skirmishes. He continued to serve in western Virginia until he was sent to Roanoke Island, N. C., with instructions to defend it. At the time of the attack upon the island by Gen. Burnside, in February 1862, he was ill on the mainland, but the greater part of his brigade, known as the Wise legion, took part in the action. He was later at the battle of Appomattox. After the war he resumed the practice of law in Richmond. He wrote 'Seven Decades of War' (1872). Consult: B. H. Wise, 'Life of Henry Alexander Wise' (1899); J. S. Wise, 'End of an Era' (1899).

Wise, Henry Augustus, American naval officer: b. Brooklyn, N. Y., 12 May 1819; d. Naples, Italy, 2 April 1860. He entered the navy as midshipman in 1834, served on the Florida coast during the Seminole War and

on the Pacific coast during the Mexican War, and rose to be chief of the bureau of ordnance and hydrography in 1866. Under the pseudonym of "Harry Gringo," he wrote 'Los Gringos; or, An Interior View of Mexico and California, with Wanderings in Peru, Chili, and Polynesia' (1849); 'Tales for the Marines' (1855); 'Scampavias, from Gibel-Tasek to Stamboul' (1857); 'The Story of the Gray African Parrot' (1856), a book for children, and 'Captain Brand of the Centipede' (1860).

Wise, Isaac Mayer, American rabbi and educator: b. Steingrub, Bohemia, 3 April 1819; d. Cincinnati, Ohio, 26 March 1900. He studied at Prague and Vienna, became rabbi at Radnitz, and, desirous of a broader field, emigrated to New York in 1846. He was elected rabbi of a synagogue at Albany, N. Y., but the ritual changes which he favored led to a division in the congregation, and a new temple was organized by his friends. In 1854 he was elected rabbi of the Congregation B'nai Teshurun, of Cincinnati, Ohio. In the same year he wrote a 'History of the Israelitish Nation,' and began to publish 'The Israelite,' followed in 1855 by 'Die Deborah.' Throughout his long years of activity, he sought in pulpit, press, and on platform to advance the cause of progressive Judaism and became its practical and popular leader, to whose efforts were due the Union of American Hebrew Congregations, the Hebrew Union College, and the Central Rabbinical Conference. Among his published works are: 'Essence of Judaism' (1860); 'Judaism, Its Doctrines and Duties' (1862); 'Prayer Book' and 'Hymnal' (1863), which were quickly followed by his 'Origin of Christianity,' 'The Cosmic God,' 'The History of the Hebrews,' 'Second Commonwealth,' 'A Defense of Judaism versus Proselytizing Christianity,' and 'Pronaos to Holy Writ.' He was president of the Hebrew Union College from its foundation in 1875 until his death.

Wise, John, American colonial clergyman: b. Roxbury, Mass., August 1652; d. Ipswich, Mass., 1725. He was graduated from Harvard in 1673 and 10 years later was settled as minister of the second parish church in Ipswich in which position he continued till his death. For remonstrating against the violation of charter rights in levying a province tax without authority from the Assembly, he was fined and imprisoned by Governor Andros in 1687. In 1689 he brought a suit against Chief Justice Dudley for denying him the privileges of the habeas corpus act, and in 1690 was chaplain to the expedition to Quebec. He took a decided and successful stand against the attempts of Increase and Cotton Mather to place the Massachusetts churches under the authority of ecclesiastical councils, putting forth two essays on the subject, 'The Churches' Quarrel Espoused' (1710) and 'A Vindication of the Government of New England Churches' (1717). A large edition of both essays was published in 1772 and a 4th edition with historical memoir by J. S. Clark (1860). In the memoir it is stated that several striking passages in the Declaration of Independence are nearly literal transcripts from the 'Vindication.' Consult Tyler, 'History of American Literature' Vol. II. (1878).

Wise, John Sergeant, American lawyer, son of Henry Alexander Wise (q.v.): b. Rio de Janeiro, Brazil, 27 Dec. 1846. He studied at the Virginia Military Institute at Lexington, which he left in 1864 to join the Confederate army, was graduated from the law department of the University of Virginia in 1867 and began to practise his profession in Richmond. In 1881 he was elected to Congress from Virginia. He was defeated as candidate for governor of his State in 1885, and in 1888 removed to New York. He has published 'Diomed' (1898); 'The End of an Era' (1899).

Wise, Peter Manuel, American alienist: b. Clarence, Erie County, N. Y., 7 March 1851. He was graduated at the medical department of the University of Buffalo in 1872; became president of the New York State Commission in Lunacy in 1896; and was professor of psychiatry at the University of Vermont 1891-5. He has published 'Text-Book for Training Schools' (1896); and monographs on 'Asylums of Great Britain' (1882); 'Sexual Perversion' (1883); etc.

Wise Men of the East, The, the three Magi, who, according to the Gospel of Matthew (ii. 1, 2), followed the guiding star to Bethlehem in order to render homage to the new born King of the Jews. A legend, which can be traced back to the 2d century, calls them kings and later times distinguished them as Melchior, Gaspar, and Balthasar. They are honored at the feast of the Epiphany and in art the youngest is portrayed as a Moor. Their bones are said to have been placed in the cathedral of Cologne and hence they are often referred to as the Three Kings of Cologne.

Wiseman, wiz'man, Nicholas Patrick Stephen, English Roman Catholic prelate: b. Seville, Spain, 3 Aug. 1802; d. London 15 Feb. 1865. He was of Irish parentage, was brought to Ireland in youth and was educated at Waterford, at the Roman Catholic College, Ushaw, near Durham, and the English College at Rome. He took orders in 1825, became professor of oriental languages in the Roman University in 1827 and in 1828 rector of the English College. He returned to England in 1835 and there delivered in 1836 at St. Mary Moorfields, London, a series of lectures on 'The Principal Doctrines and Practices of the Catholic Church,' which attracted much attention. He was consecrated titular bishop of Melipotamos in 1840 and was made archbishop of Westminster and cardinal in 1850. This ecclesiastical appointment caused great excitement among English ultra-Protestants, who termed it a "papal aggression" and resulted in the "Ecclesiastical Titles Act" prohibiting the assumption of local ecclesiastical titles by Roman Catholics, which was not repealed until 1872. In the midst of the excitement Wiseman put forth a temperate address explaining the constitutional rights of Roman Catholics, entitled 'An Appeal to the Reason and Good Feeling of the People on the Subject of the Catholic Hierarchy' (1850), which was very instrumental in bringing about a better state of feeling. In 1836 he established with O'Connell 'The Dublin Review' and was a regular contributor to it. He was the author of 'Lectures on the Connection between Science and Revealed Religion' (1836); 'Letters on Catho-

lic Unity' (1842); 'Papal Supremacy' (1850); 'Fabiola' (1854); 'The Four Last Popes' (1858); etc. Consult: 'Mémoir,' by G. White (1865); Lord Houghton, 'Monographs' (1875); Ward, 'Life and Times of Cardinal Wiseman' (1897); Fitzgerald, 'Fifty Years of Catholic Progress' (1900).

Wisham. See WUSHKUM.

Wishart, wish'art, George, Scottish preacher and agitator: b. Pitarro, Forfarshire, about 1512; d. Saint Andrew's 28 March 1546. Leaving Scotland in 1538 to avoid persecution, he became in 1543 a tutor in Christ Church College, Cambridge, where he led, according to the testimony of one of his pupils, a life of singular abstemiousness, charity, and purity. In July 1543, he returned to Scotland with the commissioners sent to negotiate a marriage treaty between Prince Edward and the infant queen of Scots. Under their protection he preached at Montrose, Dundee, and other Scottish towns, and his preaching led the people to destroy some convents and Roman Catholic churches. Arrested at Ormiston by the Earl of Bothwell, he was delivered to Cardinal Beaton, who sentenced him to be burned at Saint Andrew's. Consult Rogers, 'Life of George Wishart, the Scottish Martyr' (1876).

Wishart, or Wiseheart, George, Scottish bishop: b. Yester, East Lothian, 1609; d. Edinburgh 1671. He is said to have been educated at the University of Edinburgh, and having entered the Episcopal Church, received a charge at Saint Andrew's. In 1639, having refused to take the covenant, he was deposed from the ministry, and during the supremacy of the Presbyterian party was several times imprisoned. He subsequently became chaplain to Montrose, and after that leader's death to Elizabeth, electress palatine and titular Queen of Bohemia. He accompanied her to England, and on the Restoration was made rector of Newcastle, and in 1662 was consecrated bishop of Edinburgh. He is chiefly known by his 'History of the Wars of Montrose' (1647), written in elegant Latin. When Montrose was executed in 1650, a copy of this work was hung in contumely about his neck. Several English translations of Wishart's work have appeared, the latest in 1819.

Wishoskan, a linguistic stock of North American Indians, comprising the Patawat, Weeyot or Wiyot, and Wishosk tribes, occupying the coast of California from a little below the mouth of Eel River to a short distance north of Mad River, including particularly the country about Humboldt Bay. They also extended up the streams named into the mountain passes. Of these tribes little is known, as they are classed with the "Diggers" on account of their habit of living largely on roots. Their number is small.

Wishram. See WUSHKUM.

Wisnar, vis'mär, Germany, the second seaport of Mecklenburg-Schwerin, on the Baltic, at the head of a bay of the same name, 20 miles north of Schwerin. It has an excellent harbor, carries on an active over-sea trade, and has varied manufactures. Of the mediæval walls only four gates remain; but the numerous quaint old houses are a feature of the place, and several of the brick churches, as well as the

Fürstenhof, once a ducal residence, date from the 14th and 15th centuries. It was a Hanse town in the 13th century, passed to Sweden in 1649, was taken by the Danes in 1675, and by the Danes, Prussians, and Hanoverians in 1712, when its strong fortifications were destroyed, and in 1803 was pawned to Mecklenburg-Schwerin, which secured it finally in 1828. Pop. (1900) 19,758.

Wisner, Benjamin Blydenburg, American clergyman: b. Goshen, N. Y., 19 Sept. 1794; d. Boston, Mass., 9 Feb. 1835. He was graduated at Union College in 1813 and at Princeton Theological Seminary in 1820. In 1821-32 he was pastor of the Old South Church, Boston, Mass. In the latter year he became secretary of the American board of commissioners for foreign missions, which office he held until his death. Among his works are: 'History of the Old South Church' (Boston 1830); 'Moral Condition and Prospects of the Heathen' (1833).

Wis'ner, George Y., American civil engineer: b. West Dresden, N. Y., 11 July 1841. He was graduated at the University of Michigan in 1865; served in government survey on the Mississippi River and the Great Lakes 1865-80, and on surveys of the Mississippi, Illinois, and Des Plaines rivers 1880-4. He was superintendent of the 10th and 11th United States Lighthouse districts 1884-7 and since the last-named year has engaged in private practice. His publications include: 'Geodetic Field Work' (1883); 'Brazos River Harbor Improvement' (1891); 'Breakwaters, Sea Walls and Jetties' (1893); 'Hydraulics of Rivers Having Alluvial Beds' (1896); 'Sewage Disposal' (1896); 'Report of Deep Waterway Commission' (1900); 'Canals from the Great Lakes to the Atlantic' (1900); etc.

Wissmann, vis'män, Hermann von, German African explorer: b. Frankfort-on-the-Oder 4 Sept. 1853. He entered the German army, reaching the rank of lieutenant in 1874, and crossed the African continent in the employ of the German African Society (1880-2). He commanded an expedition sent out by Leopold II., in 1884-5, and as imperial German commissioner, suppressed the Arab revolt under Bushiri, but failed in attempting to take two steamers to Lake Victoria via Nyassa and Tanganyika lakes in 1892. He was governor of German East Africa in 1895-6, and president of the Berlin Geographical Society in 1897. He has published 'In the Interior of Africa' (3d ed. 1891); 'Under the German Flag across Africa' (1880-3); 'My Second Crossing of Equatorial Africa' (1891); 'Africa: Descriptions and Advice' (1895); etc.

Wis'tar, Caspar, American physician: b. Philadelphia, Pa., 13 Sept. 1761; d. there 22 Jan. 1818. He attended the medical department of the University of Pennsylvania in 1782, subsequently studied medicine at the University of Edinburgh, returning to the United States in 1787. He was professor of chemistry and the Institutes of Medicine at the College of Philadelphia 1789-92. In the latter year that institution was united with the medical department of the University of Pennsylvania, and he was there adjunct professor of anatomy, midwifery, and surgery 1792-1808; then becoming professor

WISTAR — WITCH-HAZEL

of anatomy and holding that chair till his death. He was the first to show that the posterior portion of the ethmoid bone was attached to the triangular bones. He opened his house once a week for meetings of students, travelers, scientists, and citizens, and these symposiums continued long after his death, and were known as the Wistar parties. Wistar became a member of the American Philosophical Society in 1787, and succeeded Thomas Jefferson as its president in 1815. He was the author of 'A System of Anatomy, for the Use of Students of Medicine.'

Wistar, Isaac Jones, American penologist: b. Philadelphia, Pa., 14 Nov. 1827. He was educated at Haverford College, Pa., and served in the Civil War as brigadier-general of volunteers, U. S. A., 1862-5. He was president of the Academy of Natural Sciences of Philadelphia 1892-6, has been inspector of the Eastern penitentiary of Pennsylvania, was president of the State Board of Charities of Pennsylvania, and founded the Wistar Institute of Anatomy and Biology, named in honor of Caspar Wistar (q.v.).

Wista'ria, a genus of leguminous climbers, named in honor of Caspar Wistar, an American anatomist (1761-1818), which contains several species, natives of China, Japan, and North America, the correct scientific name of which does not seem to be thoroughly settled. They are high-climbing, hardy shrubs, and have odd pinnate leaves, with entire leaflets, and large, terminal, pendulous racemes of papilionaceous flowers. These have large standards, and wings freed from the keel, which is incurved and obtuse and are usually purple or white in color. The fruits are coriaceous legumes, opening readily. Nearly all of the wistarias are cultivated for covering walls, verandas, trellises, etc. The Chinese wistaria (*W. chinensis*), which was introduced into England about 1816, is perhaps the best. It has profuse dense clusters of pea-shaped flowers, which are about a foot long, and bloom in May before the leaves appear and occasionally again in autumn. When grown over a trellis, the blossoms depend in great masses of blue. This vine is a rampant grower, and the flowering wood may be known by its short, jointed, antler-like growth, and absence of climbing spines.

Wistaria is a favorite plant of the Japanese, who have a variety (*W. chinensis*, var. *multi-juga*), with racemes a yard long, loosely flowered, and with small blossoms, which are fragrant, however. These they train about their houses and over trellises in greatest profusion. The American wistaria (*W. frutescens*) or kidney-bean tree, is not so vigorous as the Chinese species, and has slightly pubescent racemes, only about six inches long. It is found, when wild, climbing over trees at the edges of swamps from Virginia to Florida, and improves with cultivation.

Wis'ter, Annis Lee Furness, American translator: b. Philadelphia, Pa., 9 Oct. 1830. She was a daughter of W. H. Furness (q.v.) and was married to Dr. Caspar Wistar (d. 1888) in 1854. She made many translations of note, among them: E. Marlitt's 'The Old Mamselle's Secret' (1868); 'Gold Else' (1868); 'The Countess Gisela' (1869); 'The Little Moorland

Princess' (1873), and 'The Second Wife' (1874); Wilhelmine von Hillern's 'Only a Girl' (1870); Hackländer's 'Enchanting and Enchanted' (1871); Volkhausen's 'Why Did He Not Die?' (1871); Von Auer's 'It Is the Fashion' (1872), and Fanny Lewald's 'Hulda; or, The Deliverer' (1874). Her translations were issued in a uniform edition of 30 volumes in 1888. With F. H. Hedge (q.v.) she published 'Metrical Translations and Poems' (1888).

Wister, Owen, American novelist, grandson of Frances Anne Kemble (q.v.): b. Philadelphia 14 July 1860. He was graduated from Harvard in 1882, studied law and was admitted to the Philadelphia bar in 1889, but from 1891 has devoted his attention to literature. He has been especially successful in his delineation of Western life and character and has published 'The Modern Swiss Family Robinson' (1883); 'The Dragon of Wantley: His Tail' (1892); 'Red Men and White' (1896); 'Lin McLean' (1898); 'The Jimmy John Boss and Other Stories' (1900); 'U. S. Grant, a Biography' (1900); 'The Virginian,' which has been widely popular and has been successfully dramatized (1902); 'Oliver Wendell Holmes' in 'American Men of Letters' series (1902); 'Benjamin Franklin' in 'English Men of Letters' series (1904).

Witch, or Wych, Elm, the common broad-leaved elm (*Ulmus montanus*) of England and Scotland, which does not grow to so large dimensions as the field elm; nevertheless at Selborne, Gilbert White measured a witch elm which, seven feet from the ground, was eight feet in diameter. It is a tree of picturesque habit, and, unless grown in crowded masses, rarely produces a straight trunk. It has a wide, spreading head, often slanted to one side, and the branches begin near the base. These drooping branches lash neighboring trees unmercifully, and if they chance to rest on the ground readily strike root. The tree is easily increased by layers or by the abundant seeds. The timber of the witch elm is more durable than that of other English elms, but has their fine-grained, tough, and elastic qualities. It is very flexible when steamed, and is utilized for bent-wood work, frames in boat-building and bows; in olden times if the branches were forked, they served as divining-rods, perhaps because of the likeness in the broad, ovate leaves to that of the hazel, which is one of the so-called lightning plants. These plants are sacred to Thor, are considered to be an actual embodiment of lightning, and their forked branches (having, according to mythology, a resemblance to a lightning flash) are used as talismans to point out the hidden stores of gold or subterranean water.

Witch-hazel, a tall, sometimes arborescent shrub (*Hamamelis Virginiana*) of eastern American woodlands. It has a characteristic horizontal, straggling growth; as Thoreau says: "Its spray, so jointed and angular, is not to be mistaken for any other." Witch-hazel is one of the most difficult shrubs to eradicate from a clearing, as it has many diverging stems, so crooked and springy as to render axe-work unsuccessful. The bark is pale-gray, the leaves somewhat resembling the ovate foliage of

WITCH HILL — WITCHCRAFT

Corylus, are more or less oblique, and undulate-edged, not at all handsome, but turning to a beautiful clear yellow in autumn. No sooner have they fallen off, with the rest of the forest foliage, in October or November, than the witch-hazels reclothe themselves with a luminous vesture of filmy, feathery yellow, which turns out to be the long delayed blossoms—whether the earliest or the latest flowers of the year botanists can not decide. Individually, they are not conspicuous, having only four narrow, strap-shaped, golden petals, but are tufted on the twigs as to gild the bushes. Meanwhile the fruits, little blunt, horned woody capsules that have been slowly ripening since the previous fall, begin to gape, and by elastic fissuring, and incurring their walls, shoot their stony-hard, bullet-shaped, polished seeds far and wide. Twigs of this witch-hazel, so unorthodox in its season of blooming, and remotely resembling the hazelnut in foliage, were chosen as material for the forked divining-rods, which, twisting in the hand of the treasure-seeker, or well-digger, pointed downward and disclosed the site of subterranean water or gold. A much more practical use for witch-hazel has been found nowadays. An infusion of the leaves of witch-hazel in alcohol furnishes the familiar slightly astringent and tonic lotion for external inflammations known as "witch-hazel" or "hamamelis." Branches of witch-hazel thrown into the fire exhale the characteristic, peculiar odor of the lotion. Both the foliage and bark, moreover, contain much tannin. The witch-elm (q.v.) of England is also called witch-hazel.

Witch Hill, the name of a hill in Salem, Mass., so called because of the executions of witches which took place there in 1692. It is also known as Gallows Hill.

Witchcraft, supernatural power which persons were formerly supposed to obtain by entering into a compact with the devil. The compact was sometimes express, whether oral or written, when the witch abjured God and Christ, and dedicated herself wholly to the evil one; or only implied, when she actually engaged in his service, practised infernal arts, and renounced the sacraments of the Church. The express compact was supposed to be solemnly confirmed at a general meeting, at which the devil presided, and sometimes privately made by the witch signing the articles of agreement with her own blood, or by the devil writing her name in his "black book." The contract was sometimes of indefinite duration, at other times for a certain number of years. The witch was bound to be obedient to the devil in everything, while the other party to the act delivered to the witch an imp, or familiar spirit, to be ready at call and to do whatever was directed. He further engaged that they should want for nothing, and be able to assume whatever shape they pleased to visit and torment their enemies and accomplish their infernal ends. The belief in witchcraft appears to have existed in various forms among ancient nations, including the Hebrews; it prevails to-day among savage and semi-savage races, and is not extinct in civilized countries. It was always condemned by the Church, and in the 14th century the popes believed that they recognized in sorcery a prevalent and dangerous evil, and began to issue bulls against it. In the 15th century the Inqui-

sition took charge of the work of exterminating witches, and the close of that century, and the beginning of the 16th, witnessed thousands of executions in Germany, Italy, and other countries. France was slow to permit any general persecution of witches, and it was not until about the time of the break with Rome that the first formal enactment, of 1541, declared witchcraft to be a felony in England. From that time on, for more than a century, the burning of witches was kept up in England and Scotland, the statute of 1563 being the first regular enactment against the supposed crime in the latter country.

The Reformation was attended by, or rather, coincident with, an increased intensity of the witchcraft superstition, and its resulting horrors. Theologians of all creeds were equally believers in the reality of compacts with the devil, and regarded the persons who entered into such compacts as unfit to live. It is probable that the religious fervor aroused by controversy over disputed dogmas may have served to bring more vividly to the minds of clergy and laity alike their assumed obligation to obey the Scriptural injunction against witchcraft, and that, in this way, the Reformation may have promoted this form of persecution. Besides, the tribunals actively engaged in crushing out disbelief in the accepted creeds of their respective states, could readily devote any surplus energy and zeal to what seemed to them the related crime of witchcraft. From one end of Europe to the other executions of witches were of daily occurrence, and it is estimated that, from the time of the promulgation of the bull of Pope Innocent VIII. against sorcery, in 1484, until 1782, when the last judicial victim, a servant girl at Glarus, in German Switzerland, was executed, 300,000 women perished on this often imaginary charge. Some of the victims were probably poisoners, but very many of them were undoubtedly innocent of any wrong-doing whatever. Children of tender years were sometimes among the condemned.

Spanish America witnessed many executions on the charge of witchcraft, and it is stated on credible authority that as late as 20 Aug. 1877 five alleged witches were burned alive at San Jacobo, Mexico. This appears to have been more in the nature of a lynching than of an execution of a sentence of a competent court.

In England and Scotland, as already stated, the 17th century witnessed hideous scenes of witch-torture and extermination. The last victims in England were Mrs. Hicckes and her daughter, nine years of age, executed in 1716, and the last in Scotland suffered in 1722. Prosecution for witchcraft was abolished both in England and in Scotland by 9 George II. (1736), which made all persons pretending to use the name punishable by imprisonment. By a subsequent act passed in the reign of George IV., they were made punishable as rogues and vagabonds.

All the American colonies had laws against witchcraft similar to those in England at the time, and from the first there were occasional trials and executions on that charge. The great Salem witchcraft delusion, with its attendant tragedies, occurred near the close of the 17th century and was largely due to excitement caused by the teachings and writings of Cotton Mather, the noted Puritan divine, who was a

strong believer in the superstition. The Salem witch frenzy broke out in the family of one Samuel Parris, a minister, but for whose instigation the delusion, with its accompanying sacrifice of innocent lives, could not have obtained the headway it did. A company of girls suddenly began to act mysteriously, bark like dogs, and scream at something unseen. An old Indian servant was accused of bewitching them. The excitement spread and impeachments multiplied. A special court was formed to try the accused, and as a result the jails rapidly filled, and many were condemned to death. It was unsafe to express a doubt of a prisoner's guilt. Fifty-five persons suffered torture, and 20 were executed before the delusion ended. Witches were supposed to be able, with the assistance of the devil, not only to foretell events, but to produce mice and vermin, to deprive men and animals, by touching them or merely breathing on them, of their natural powers, and to afflict them with diseases, to raise storms, etc., to change themselves into cats and other beasts, etc. General assemblies of witches, called "Witches' Sabbaths," were held yearly, or oftener, at which they appeared entirely naked, and besmeared with an ointment made from the bodies of unbaptized infants. To these meetings they were supposed to ride from great distances on broomsticks, pokers, goats, hogs, or dogs, the devil taking the chair under the form of a goat. Here they did homage to their master, and offered him sacrifices of young children, etc., and practised all sorts of license till cock-crowing. Necophytes were introduced to the devil at these meetings, and received his mark on their bodies, in token that they had sold their souls to him. As before remarked, the belief in witchcraft still prevails in many parts of the world, and in some countries where pretended sorcerers exert a powerful influence, lives are often sacrificed as a result of their practices.

Witch's Butter. See NOSTOC.

Witenagemot, wīt'ē-nā-gē-mōt', or **Witenagemote**, originally an assemblage of all the freemen of a tribe or state, among the Teutonic conquerors of southern Britain, but which, in the course of events, and without any special law, resolved itself into an assembly of the princes, aldermen, thanes, large landowners, and leading ecclesiastics. The witenagemot met once a year, or oftener, and had great power, electing a king in the event of disputed succession, approving the regular succession, if there was no dispute, passing upon the trial and punishment of high offenders, enacting laws, and acting as a grand inquest into public affairs. It passed out of existence with the Norman conquest, and the subsequent Parliament was a separate growth, and not a continuation of the Witenagemot. See ENGLAND.

Wither, with'ēr, or **Withers**, **George**, English poet and pamphleteer: b. Bentworth, near Alton, Hampshire, 11 June 1588; d. London 2 May 1677. He studied at Magdalen College, Oxford, was entered at Lincoln's Inn in 1615, devoted much attention to literature, and proved his skill in satiric verse by being thrown into the Marshalsea for his 'Abuses Strip and Whipt' (1613). While there imprisoned he wrote busily, and is said to have composed there several of his best poems, among them 'The

Shepherd's Hunting' (1615), a continuation of 'The Shepherd's Pipe' (1614) of William Browne. In 1621 some official persons thought reflections against the state and leading politicians were to be detected in 'Wither's Motto, Nec Habeo, Nec Careo, Nec Curo' (1621), and again the author was ordered to the Marshalsea, though soon liberated. After 1622 he wrote nothing, save 'Hallelujah' (1641), a collection of religious verse, that in critical estimation attained the rank of earlier work. He became a Puritan, and wrote largely for the furtherance of the political and religious cause with which he was identified. At the revolution, he recruited (1642) a troop of horse for Parliament, and was made captain and the commander of Farnham Castle. When taken by Royalists and in danger of capital punishment, he was released through the interference of Sir John Denham (q.v.), who protested that "so long as Wither lived he [Denham] would not be accounted the worst poet in England." He was promoted major, made a commissioner for the sale of the king's goods, and (1655) became a clerk in the statute-office of the court of chancery. For his 'Vox Vulgi,' a poem dissuading from the restoration which remained in MS. until printed by Macray in 'Anecdota Bodleiana' (1880), he was committed to Newgate in 1660, and imprisoned there until released in 1663 under bond for good behavior. 'Fragmenta Poetica' (1666; reprinted as 'Fragmenta Prophetica,' 1669) was his last work. For some time subsequent to his death he was considered a ringer of no merit, was omitted from collections of English poetry, and included in the 'Dunciad' as "wretched Withers." But Ellis praised him in 'Specimens of the Early English Poets' (1790), and others, including Sir S. E. Brydges by various reprints and Lamb by the essay 'The Poetical Works of George Wither' (Lamb's 'Works,' 1818) obtained for him suitable recognition. His reputation is based chiefly on his earlier work. The greater part of his writings was printed by the Spenser Society (20 pts., 1870-83). Consult besides the books already mentioned Ward's 'English Poets,' Vol. II. (1880).

Witherite, a mineral composed of barium carbonate mined extensively near Hexham, Northumberland, England. Usually found in massive condition though orthorhombic crystals do occur; hardness, 3 to 3.75; specific gravity, 4.29 to 4.35; lustrous, vitreous; color, white, often yellowish or grayish; streak, white. Used in the manufacture of baryta for sugar refining, in plate-glass making, and in the adulteration of white lead and zinc white.

Witherspoon, John, American Presbyterian clergyman and college president: b. Yester, Haddingtonshire, Scotland, 5 Feb. 1722; d. near Princeton, N. J., 15 Sept. 1794. He was graduated from the University of Edinburgh in 1742, was licensed to preach the next year and was parish minister of Beith, 1745-57. He led a body of militia to the aid of the Pretender at Glasgow in 1745 and was captured at the battle of Falkirk, but was soon released. He was pastor at Paisley, 1757-68, and then accepted the presidency of the College of New Jersey (now Princeton College) in 1768. He was a delegate for six years from New Jersey to the Continental Congress; and a signer of the Declaration of Independence. He greatly increased the efficiency of the college and was a

WITHINGTON—WITTENBERG COLLEGE

noteworthy figure in the political as well as the educational affairs of his time. He wrote: 'Ecclesiastical Characteristics' (1753); 'Nature and Effects of the Stage' (1757); 'Essays on Important Subjects' (1764); 'Considerations on the Nature and Extent of the Legislative Authority of the British Parliament' (1774); etc. His collected works appeared in nine volumes in 1804.

Withington, wíth'ing-tón, England, a manufacturing town in Lancashire, three miles south of the centre of Manchester, in the parliamentary borough in which it is partly included. It contains modern churches and chapels, Lancashire Independent College, a public hall and library, and numerous residential villas. Pop. (1901) 36,201.

Witte, vít'tě, Emanuel, Dutch painter: b. Alkmaar, Holland, 1607; d. Amsterdam 1692. He was a pupil of Van Alst, lived at Delft in 1642 to 1649, and in 1650 went to Amsterdam. His earlier paintings were mostly historical or portraits, but later he devoted some attention to interior decoration with which he was very successful. His works are found at the museums of Amsterdam, Rotterdam, Brussels, Berlin, Hamburg, and Weimar, also in the National Gallery at London, and in some private English galleries.

Witte, Pietro de, Dutch painter: b. Bruges 1548; d. Munich 1628. His general choice of subjects was confined to history, but it is not known under whom he studied in his native country before going to Italy, where he became an intimate friend of Giorgio Vasari, under whom he appears to have formed his style. When Vasari was employed to decorate the Vatican with frescoes De Witte became his favorite assistant, and grew almost completely Italianized in his artistic ideals. He painted equally well in fresco and oils, and was invited to Florence by the Grand Duke of Tuscany, and there executed some important works. His versatility is evidenced by the fact that when Maximilian, the elector of Bavaria, required the services of a designer of tapestry De Witte was commissioned to furnish the necessary cartoons. He was one of the Dutch painters of the Renaissance period who gave himself up entirely to the influence of foreign schools and spent but a short part of his life in the Netherlands. His principal works have been engraved by Jan Sadeler and other famous engravers of his day.

Witte, Sergei Yulievitch, Russian statesman: b. Tiflis 29 July 1849. He was graduated from the New Russian University, Odessa; and in 1877 entered the governmental railway service. He had charge of transporting troops on the Odessa Railway during the Russo-Turkish war, in 1879 was given a position on the South-western Railway, in 1886 became general manager of that road, and two years later chief of the railway department. In 1892 he was made minister of finance, and in this capacity he made several commercial treaties with Germany, aided the development of manufacturing industries, made the sale of alcohol a government monopoly, and established the gold standard. His policy aroused the opposition of wealthy bankers, and of all conservatives, and in 1903 he was removed from the office of minister of finance, but was appointed president of the committee of minis-

ters; this, though nominally a promotion, was very generally regarded as a triumph for his opponents, since it removed him from his greatest sphere of influence and made it impossible for him to carry his plans to completion. He wrote 'Principles of Railway Tariffs' (1883); 'Friedrich Liss, the Economist' (1888).

Wittekind, vít'tě-kind, or **Widukind**, Saxon leader in the struggle with Charlemagne; d. about 807. He came of a noble Westphalian house, and first appears at the head of the Saxon expedition against the Westphalian fortress of Eresburg in 774. Charlemagne's return from Lombardy drove him across the Weser, and instead of submitting to the emperor at the Diet of Paderborn in 777 like many other Saxon leaders, renewing the revolt in 776, he fled to Jutland. He returned during Charlemagne's absence in Spain, laid waste the Rhineland and surprised and annihilated the Frankish army on the Süntelgebirge (782). The emperor retaliated by executing 4,500 Saxon prisoners, an action that aroused the entire Saxon race to arms. The battle of Detmold was indecisive (783), but that of Osnabrück forced Wittekind to enter on negotiations, the issue was that in 785 he accepted baptism in the imperial camp at Attigny, in Champagne. The emperor, it is said, made him duke of the Saxons and lord of Engern, and from the castle of Babilonic, near Lübeck, he exercised a benignant sway till he fell in battle with Gerold, the Swabian duke. Various princely houses, as those of Brunswick and Sardinia, claim Wittekind for the founder of their line. The Emperor Charles IV. in 1377 placed a monument to him in the parish church at Enger, where he is supposed to have been buried, and in Menden, Westphalia, a monument was erected to him in 1812. Consult Didekamp, 'Widukind, der Sachsenführer nach Geschichte und Sage' (1877); Mombert, 'Charles the Great' (1888).

Wittenberg, wít'těn-běrg, Ger. vít'těn-běrg, Germany, a town of the province of Saxony, Prussia, on the Elbe, 45 miles southeast of Magdeburg. It was the home of the Reformation, and here Luther, while a university professor, nailed his 95 theses to the door of the Schlosskirche. The university in which he was professor was united to Halle in 1817. The principal buildings are the Schlosskirche, in which both Luther and Melancthon are buried; the Stadtkirche, where Luther and Melancthon preached; the remains of the Augustinian monastery, with Luther's apartments; the houses of Melancthon and Cranach; the town hall, the gymnasium, etc. Textiles, hosiery, leather, machinery, pottery, etc., are among its manufactures. Pop. (1900) 18,333.

Wittenberg College, located at Springfield, Ohio. It was founded in 1845 under the auspices of the Lutheran Church in Ohio. Its organization includes a Preparatory School, a Collegiate Department, a Theological Seminary, a School of Oratory, a Conservatory of Music, and a School of Art. There is also a Summer School, designed chiefly for teachers, giving courses in pedagogical methods. The Collegiate Department confers the single bachelor's degree of A.B. for a four years' course. Women are admitted to all departments except the Theological Seminary; and there is also a special shorter collegiate course for young women.

WITTHAUS—WOFFORD COLLEGE

which leads to a diploma, but not to a degree. In 1903 the grounds and buildings were valued at \$350,000; a theological building was erected in 1902; the productive funds in 1903-4 amounted to \$300,000, the income to \$28,500; the library contained 12,500 volumes. The students numbered 515, and the faculty 21.

Witthaus, wīt'how's, **Rudolph August**, American toxicologist: b. New York 30 Aug. 1846. He was graduated from Columbia in 1867, and from the Medical Department of the University of New York in 1875, has since been professor of toxicology and chemistry at Cornell University, and held similar chairs in the universities of New York, Vermont, and Buffalo. He became noted as an expert in poisons in connection with many murder cases, and has published: 'Essentials of Chemistry' (1879); 'General Medical Chemistry' (1881); 'Manual of Chemistry' (1879); and 'Laboratory Guide in Urinalysis and Toxicology' (1886). He has edited 'Witthaus and Becker's Medical Jurisprudence' (4 vols.), for which he prepared the introduction, and Vol. IV. on 'Toxicology.'

Witwatersrand, wīt-vā'tērs-rānd ('White Waters Range,' colloquially 'The Rand'), Transvaal, South Africa, a low range of hills extending 25 miles either side of Johannesburg, since 1886 famous as one of the richest gold-mining districts in the world. See TRANSVAAL, GOLD-MINING IN THE.

Wixom, wīk'sōm, **Emma**. See NEVADA, EMMA.

Wiyot. See WISHOSKAN.

Woad, wōd, a cruciferous herb (*Isatis tinctoria*) which has been used for centuries in the countries of temperate Europe, as a dye-plant, yielding an indigo-blue color. The woad has entire foliage, the stem leaves being sagittate, and has large coriaceous pods. Cæsar tells us that the ancient Britons stained their bodies with woad, so as to give themselves a more formidable appearance in battle; and from Pliny we learn that their women, before engaging in certain religious rites, also covered their nude bodies with the dye. The plant was formerly much cultivated in England for the sake of its dye, which was extracted from its crushed and fermented leaves, but the stronger and finer blue produced by the indigo-plant (q.v.) finally superseded it, although at first the latter produced but a crude dye. Those who cultivated woad opposed the introduction of indigo, and the opposition to it became so pronounced that in England and other European countries royal edicts were issued forbidding its importation. These were repealed by the middle of the 18th century. Woad is now mixed in the vats with indigo juice, but is of use chiefly as a convenient material to induce fermentation, although it is said also to improve the color itself.

Woburn, wō'bērn, Mass., city in Middlesex County; on two lines of the Boston & Maine Railroad; five miles from tidewater and 10 miles northwest of Boston. It is well laid out and has many handsome residences. The chief manufactures are leather, chemicals, machinery, glue, and foundry products. The number of employees in the leather works alone is (1904) 2,500. In 1900 (government census) Woburn had 123 manufacturing establishments, capitalized for \$2,983,705. The salaries of 50

officials and clerks, in the manufacturing works, amounted to \$65,217, and the 1,596 wage-earners received annually \$757,670. The raw material used each year cost \$3,064,985, and the value of the finished products was \$4,450,566. The water-works are owned and operated by the city. There are 12 churches; a high school, established in 1852; public and parish elementary schools, and a free public library which contains about 43,000 volumes and a fine art collection. There are three banks. In 1903 the Woburn Five Cent Savings Bank had deposits amounting to \$1,707,000. The government is administered under a charter of 1898 which provides for a mayor and a council of 15 members. Seven of the members of the council are elected by wards and eight at large. There is also a board of public works, the mayor is president *ex officio*.

Woburn was settled in 1640 by seven families from Charlestown Church, Mass. It was first called Charlestown Village. In 1642 the town was incorporated, and in 1889 chartered as a city. Benjamin Thompson (q.v.) (Count Rumford) was born here in 1753. Pop. (1890) 13,499; (1900) 14,254; (1903, est., Gov. Report) 14,482.

GEORGE A. HOBBS,

Editor 'Woburn Journal.'

Woden, wō'dēn. See ODIN.

Woffington, wōf'ing-tōn, **Margaret or Peg**, British actress: b. Dublin, Ireland, 18 Oct. 1720; d. Teddington 28 March 1760. She first appeared on the stage at 12 as Polly Peacham, with several other children, in 'The Beggar's Opera,' but her first appearance in a mature part was as Ophelia in Dublin in 1737. From 17 to 20 she played on the Dublin stage all manner of parts, from Ophelia to Sir Harry Wildair, and on 6 Nov. 1740 made her first appearance at Covent Garden as Sylvia in the 'Recruiting Officer.' She soon became a great success, the exquisite art of her male characters being especially remarkable. She kept the affection of the public till the tragic close of her career. On 3 May 1757 she broke down in playing Rosalind, and left the stage forever. Her character appears to advantage in Reade's novel 'Peg Woffington,' and his play 'Masks and Faces.' Consult: Molloy, 'Life and Adventures of Peg Woffington' (1884); Daly, 'Woffington: a Tribute to the Actress and the Woman' (1888).

Wofford College, located at Spartanburg, S. C. It was founded in 1851 under the control of the South Carolina Conference of the Methodist Episcopal Church, South, in accordance with the will of Benjamin Wofford, a minister of that church, who left a legacy of \$100,000 to the conference for establishing a college. It was opened to students in 1854, and the sessions have never been entirely suspended, though during the Civil War the college suffered heavily, the endowment was rendered worthless, and full college work was not done. Since that time the college has been largely supported by the church, and the endowment partially restored, amounting in 1903-4 to \$86,000. Two preparatory schools have been established in connection with the college, the Wofford College Fitting School at Spartanburg, and the Carlisle Fitting School at Bamberg, S. C. The course in the former is three years; in the latter, four years. The Carlisle school is co-edu-

educational. The college studies are arranged in four groups, or courses, the classical, the language-scientific, the scientific, and the Latin or Greek-modern language; each group includes a certain number of electives. The degree of A.B. is conferred for the completion of any of these courses; and the degree of A.M. for graduate work. Instruction in methods of teaching and in school organization is included in the curriculum. Gymnasium work is required of all students. There are five loan funds and two scholarship funds. The students maintain two literary societies, membership in one of which is compulsory; and a Christian Association which has been in existence over 20 years, and exercises an important influence on student life. The college campus comprises 70 acres; the buildings include the main building, the John B. Cleveland Science Hall, Alumni Hall, Archer Hall (a dormitory), residence cottages, the Wilbur E. Burnett gymnasium, and the fitting school. The library in 1904 contained 8,000 volumes; the students at Spartanburg numbered 334, of whom 196 were in the college.

Wohlgemuth, vōl'gē-moot, **Michael**, German painter: b. Nuremberg 1434; d. there 1519. He was an eminent member of the Franconia school of German painting whose completest representative is Albert Dürer. The latter was indeed his pupil in the large studio or workshop where many branches of art were carried on by the master and a host of pupils and assistants. The occupations of this artistic association comprised altar-pieces, consisting of paintings, or wood carvings in high relief ablaze with color and gilt, such as abound in Spanish churches under the name of *retablos*; wood engraving, the blocks being cut from Wohlgemuth's designs, which were of supreme vigor and well adapted to the exigencies of printing from wood and easel paintings of portraits and history. Many paintings have been attributed to him which were evidently executed by the less skilful hands of pupils or assistants, but those whose authenticity is unquestionable are characterized by powerful drawing, rich and harmonious coloring and supreme delicacy of finish. His *retable* (1465), now in the Munich Gallery, is a remarkable masterpiece, and that which he furnished for the High Altar of Saint Mary at Zwickau gained for the painter much applause and the then princely sum of about \$3,558. Another work of the same kind is to be found in Nuremberg Museum, having been originally painted for the churches of the Austin Friars at Nuremberg; his last *retable* was executed for the church at Swabach (1508). His fidelity and grace as a portrait painter are acknowledged by critics, who recognize in his realistic vigor and conscientious mastery of detail the best features of contemporaneous German painting. Two of his paintings, 'Pilate Washing His Hands Before the People' and a 'Descent from the Cross,' are in the Royal Institution Gallery at Liverpool, but few works of this master are to be found elsewhere out of Germany.

Wojwode, woi'wōd, an old Slavonic name for a general, afterward used as a title of civil rank and authority. The princes of Wallachia and Moldavia were called wojwodes and this name was given in Poland to the governors of the provinces, a title abolished in 1832. In Serbia and Bulgaria the title of wojwode still lin-

gers with its original signification of 'leader in war.'

Wolcott, wūl'kōt, or **Wolcott**, **John** ('PETER PINDAR'), English poet: b. Dodbrooke, Devonshire, May 1738; d. London 14 Jan. 1819. He studied medicine and in 1767 went to Jamaica as physician to the governor, Sir William Tre-lawney. He then took orders in the Church of England and was a curate in Jamaica, 1769-73. After spending the next 12 years as a physician in Cornwall he went to London, where his daring poetical satires involved him in many quarrels and brought him extended fame. So effective were his attacks on King George III. that the ministry silenced him with a pension of \$1,500 per annum. He was an art critic of taste and penetration far beyond his time; his yearly reviews in verse of the Academy exhibitions are much the best of his work, and still instructive. Among his satires are: 'Lyric Odes to the Royal Academicians' (1782-6); 'Bozzy and Piozzi' (1786); 'An Epistle to the Reviewers'; 'Peeps at St. James'; 'Royal Visits'; and 'The Lousiad' (1785-95). Consult Reiterer, 'Leben und Werke Peter Pindars' (1900).

Wolcott, **Edward Oliver**, American lawyer and politician: b. Longmeadow, Hampden County, Mass., 26 March 1848. In 1862 he went to Cleveland, Ohio, with his family, and during the Civil War was enlisted with the 105th Ohio regiment for a few months. He entered Yale in 1866, but did not complete his course; and was graduated from the Harvard Law School in 1871. He then went to Colorado, where he established a law office in Georgetown, Clear Creek County; in 1876 he was elected district attorney for the first judicial district of the State, and before the expiration of his term cleared the docket of all criminal cases. In 1878 he was elected to the State senate, where he became the Republican leader. In 1879 he was made attorney for the Denver & Rio Grande Railroad; settled in Denver, where he built up a large private practice; and in 1884 was appointed general counsel of the same road. In 1888 he was elected to the United States Senate, and re-elected in 1894. There he was known as an earnest advocate of bimetalism; in 1896, however, he refused to support the free-silver platform of the Democratic party, continued his affiliation with the Republican party; and in 1900 was president of the National Convention. In 1897 he was chairman of a commission appointed by President McKinley to investigate the attitude of the leading European governments toward international bimetalism. In 1903 he was again a candidate for election to the United States Senate, but was defeated by H. M. Teller (q.v.).

Wolcott, **Oliver**, American statesman and signer of the Declaration of Independence, son of Roger Wolcott (1679-1767) (q.v.): b. Windsor, Conn., 26 Nov. 1726; d. Litchfield 1 Dec. 1797. He was graduated at Yale College in 1757 and in the same year received a captain's commission from the governor of New York, and raised a company for the defense of the northern frontier, where he remained until the peace of Aix la Chapelle. In 1751 he was appointed sheriff of Litchfield County, Conn., and in 1774 a member of the State council. He was also chief judge of the court of common pleas, a judge of the probate court, and a major-

general of militia. In 1775 he was appointed one of the commissioners of Indian affairs for the northern department, whose duty was to secure the neutrality of the Indians. In 1776 he commanded the 14 Connecticut regiments raised to act with the army in New York, and in the same year took his seat in Congress. After the Declaration was signed he returned to the army, and was present at the battle of Saratoga, but continued to serve in Congress at intervals till 1783. He was lieutenant-governor of Connecticut 1786-96, when he was elected governor, which office he held at the time of his death. Consult Sanderson, 'Biographies of the Signers' (1820-7).

Wolcott, Oliver, American politician, son of the preceding: b. Litchfield, Conn., 11 Jan. 1760; d. New York 1 June 1833. He was graduated from Yale in 1778, and for a short time served as volunteer aide to his father in the Revolutionary War. After his admission to the bar in 1781 he was for several years in the employ of the financial department of the government of Connecticut and assisted Oliver Ellsworth in 1784 in settling the accounts between his State and the United States. In 1788-9 he was comptroller of the United States public accounts, auditor of the United States treasury 1789-91, comptroller 1791-5, and secretary of the national treasury 1795-1800, in succession to Alexander Hamilton. He was a judge of the United States circuit court 1801-2, and then removed to New York and was in mercantile business there till 1812. He aided his brother Frederick in building extensive factories at Wolcottville, Conn., and was governor of Connecticut 1818-27. His later years were spent in New York. He published several political pamphlets and in 1846 his papers were edited by Gibbs with the title 'Memoirs of the Administrations of Washington and John Adams.'

Wolcott, Roger, American colonial governor: b. Windsor, Conn., 4 Jan. 1679; d. East Windsor, Conn., 17 May 1767. At 12 he was apprenticed to a weaver, but by private study secured an education, and in 1711 was appointed commissary of the Connecticut colonial forces in the attack on Canada. In the subsequent French wars he was successively promoted till he attained the rank of major-general at the siege of Louisburg in 1745. He was governor of the colony of Connecticut 1751-4 and had previously been repeatedly member of the assembly and of the council, judge of the county court and of the superior court, and deputy governor. He published in 1725 'Poetical Meditations, Being the Improvement of Some Vacant Hours'; and wrote a poem of 1,500 lines entitled 'A Brief Account of the Agency of the Honorable John Winthrop, Esq., in the Court of King Charles II., A.D. 1662,' in which he gives a description of the Pequot war. The latter was first printed in the collections of the Massachusetts Historical Society, and the original is among the manuscripts of the Connecticut Historical Society.

Wolcott, Roger, American lawyer and governor: b. Boston 13 July 1847; d. there 21 Dec. 1900. Graduated from Harvard University in 1870 and from the law-school of the university in 1874, he was admitted in the latter year to the bar, but subsequently practised little. In 1877-9 he was a member of the common

council of Boston, and in 1882-5 of the Massachusetts house of representatives, where he gained a considerable reputation by his oratory and his activity in constructive politics and the furtherance of good government. He was sent as a delegate to the State Republican convention in 1885, in 1887-9 was again a member of the Boston common council, and in 1891 was chosen first president of the newly-organized Republican Club of Massachusetts, in which post he rendered valuable service to his party. This was recognized by his nomination as lieutenant-governor. He was elected in 1893, served by re-election until 1896, and upon the death of Gov. F. T. Greenhalge in the latter year became acting governor. In November 1896 he was elected governor by the largest plurality ever given in the State to a candidate for the office. In 1897 and 1898 he was re-elected. He declined the ambassadorship to Italy in 1899.

Wolf, wülf, Edmund Jacob, American Lutheran clergyman: b. Rebersburg, Pa., 8 Dec. 1840. He was graduated at Pennsylvania College, Gettysburg, in 1863, and served for a time in the Union army. Subsequently he studied theology at Gettysburg Theological Seminary and also at Tübingen and Erlangen, Germany, and was ordained in the Lutheran Church in 1865. After holding several pastorates he became professor of New Testament exegesis and church history at the Theological Seminary, Gettysburg, in 1874. He is author of 'Lutherans in America' (1889); the 10th volume of the 'Lutheran Commentary' (1897); 'Lectures on the Gospel Lessons' (1900); etc.; and has at various times edited the 'Lutheran Quarterly' and 'Lutheran World.'

Wolf, Emma, American novelist: b. San Francisco, Cal., 15 June 1865. She was educated in the schools of her native city, and early developed a bent for authorship. She has published: 'Other Things Being Equal' (1892); 'A Prodigal in Love' (1894); 'Joy of Life' (1896); 'Heirs of Yesterday' (1900).

Wolf, völf, Ferdinand, Austrian romance scholar: b. Vienna 8 Dec. 1796; d. there 18 Feb. 1866. He studied philosophy and jurisprudence at Grätz; received a position in the Royal Library at Vienna and took an active part in the foundation of the Academy of Sciences, of which he became secretary. Among his many publications, all characterized by research and critical acumen, are: 'Collection of Modern Castilian Rhymes' (1873); 'Historical Studies of Spanish and Portuguese National Literature' (1859); 'History of Brazilian Literature' (1863); etc. With C. Hofmann he edited a collection of the oldest Spanish romances and contributed frequently to the Vienna 'Jahrbücher der Literatur.'

Wolf, Friedrich August, German classical scholar: b. Haynrode, near Nordhausen, Prussia, 15 Feb. 1759; d. Marseilles, France, 8 Aug. 1824. He was educated at the gymnasium of Nordhausen and the University of Göttingen, and in 1782 was appointed rector of the Bürgerschule at Osterode in the Harz. The next year he was called as professor of philosophy and paediatrics to Halle, where he labored upward of 20 years with the highest enthusiasm for the cause of education. In 1793 appeared his 'Prolegomena in Homerum' (3d and 4th eds., 1872 and 1875). In this he contended that

WOLF

the 'Iliad' and 'Odyssey' were not the work of one man, but of several Homeric rhapsodists (wand-bearing minstrels). The work in which he tried to maintain this statement created a profound sensation and has had the effect of permanently modifying the opinions of Homeric scholars as to the manner of the composition of the 'Iliad' and 'Odyssey.' (See HOMER.) From a literary point of view his labor has been of immense service. The University of Halle was suppressed in 1807, in the storm of the French invasion, and Wolf then removed to Berlin, where he entered the ministry of public instruction, but soon resigned that he might give himself to the work of academic teaching, which disappointment and ill-health compelled him to give up in 1824 when he went south on a voyage for the sake of his health, but did not long survive his arrival at Marseilles. Wolf's great work was the invention, or at least the bringing into prominence of a new instrument of education, namely, philology, which he defined as no meagre study of the forms of language but "a knowledge of human nature as exhibited in antiquity." Locke and Rousseau had founded a school of educational theory which they considered to be more in accordance with common sense and modern needs than the classical culture of the Renaissance. Wolf revived the mental discipline and scientific aim implied in the prosecution of classical studies. Consult: Pattison, 'Friedrich August Wolf' (in the 'North British Review' for June 1865); Wolf, 'Prolegomena in Homerum' (1795); Müller, 'Homerische Vorschuhe' (1836); Lachmann, 'Betrachtungen über Homers Ilias' (1865); Volkman, 'Geschichte und Kritik der Wolf'schen Prolegomena' (1874); also the Homeric writings of Gladstone, Blackie, Paley, Heyman, and Geddes.

Wolf, wülf, Henry, American engraver: b. Eckwersheim, Alsace, 3 Aug. 1852. His artistic training was completed at Strasburg, and when he came to New York, about 1875, his ability soon made itself known. He exhibited at the Paris Salon in 1888 and 1895, winning a gold medal in the latter year; and at the World's Columbian Exposition of 1893 and the Paris Expositions of 1889 and 1900. His chief works are: 'Engravings Illustrating American Artist Series' and 'Gilbert Stuart Series of Women and Men' in the 'Century Magazine.'

Wolf, völf, Hieronymus, German classical scholar: b. Göttingen 13 Aug. 1516; d. 8 Oct. 1580. From 1557 till his death he was director of a school at Augsburg. He was one of the foremost Greek scholars of his century and is held in remembrance for his carefully annotated editions, with Latin translations, of Isocrates (1570) and Demosthenes, as well as for editions of Byzantine historians and many other classical labors.

Wolf, Rudolf, Swiss astronomer: b. Faldanden, near Zürich, 7 July 1816; d. Zürich 6 Dec. 1893. He was teacher of mathematics and physics in the realschule at Berne, 1839-55; and director of the observatory there in 1847. He was also professor of astronomy in the Bern University in 1853; professor of astronomy in the Polytechnikum and director of the observatory at Zürich in 1855, and later professor of mathematics and astronomy in the university there. He was famous for his investigations

concerning the periodicity of sun spots and the accompanying magnetic variations, and wrote extensively on the history of science, especially astronomy. His 'Astronomical Miscellany,' 1856-93, is a well-known series of papers, and his 'History of Astronomy' (1877) is a standard work of reference.

Wolf, wülf, Simon, American lawyer and communal worker: b. Hinzweiler, Bavaria, 28 Oct. 1836. A graduate of Ohio Law College, Cleveland, Ohio, in 1861, he has since resided in Washington, D. C., where he served as recorder of deeds for the District of Columbia, 1869-78. In 1881-2 he was United States minister to Egypt. While prominent in social and benevolent circles in Washington, he is identified with Jewish progress in America, was a founder of the B'nai B'rith Orphan Asylum at Atlanta, Ga., and for many years president of the Board of Delegates on Civil and Religious Rights of the Union of American Hebrew Congregations. In addition to various monographs, he has published 'The American Jew as Patriot, Soldier, and Citizen' (1898).

Wolf, a river in Wisconsin; rises in the northeastern part of the State, flows generally south, passes through Pewaugan Lake, and enters the Fox River. Wolf River has been of great benefit in the development of the lumber industry in the northeastern part of the State. It is navigable for small steamers for about 150 miles.

Wolf, a typical wild species of the dog family (*Canidae*). So closely related are wolves to the domestic and other true dogs (q.v.) that zoologists have been unable to find any satisfactory structural differences. As the distinctions are purely specific and largely founded upon the habits and character of the fur, all of the wolves are customarily placed in the extensive genus *Canis* along with the dogs and jackals. Excepting some of the domesticated varieties of dogs, wolves are the largest members of the family, and normally they howl and do not bark as do the dogs and jackals. Their natural range is throughout North America and Eurasia, but no true wolves are found in the Southern hemisphere, where they are replaced by the smaller carrion-eating jackals and fox-dogs. As they inhabit indifferently mountain-tops, plains, and swamps, and are equally at home on the frozen Arctic shores and the tropical swamps of Mexico and India, they exhibit, as might be expected, a great range of variation. Generally they increase in size, vigor, and courage northward, and the fur becomes more shaggy and thicker. The species and varieties have never been very satisfactorily discriminated and many zoologists consider that the large northern woodland wolf of both continents is a single wide-ranging variable species. Certainly these active animals are free to cross between the Old and New worlds in the winter on the ice by way of Greenland or Alaska.

The American gray or timber wolf (*C. occidentalis*) when full-grown measures 5½ feet in length, whereof 18 inches belong to the tail; its height is 33 inches, and its weight over 100 pounds. The general aspect is that of a large dog, and, indeed, the domestic dogs of the Indians were partly derived from this species and some of the European varieties from the native wolf. They are lank, long-limbed creatures with

WOLF-FISH

erect ears and drooping, rather bushy tails; the hair of the neck is generally more or less elongated and erectile. The color is very variable, the prevailing tone being gray, more or less marked with black; and becomes paler in winter and more reddish in summer. Southward the colors deepen, leading to the black wolf (*C. ater*) of Florida, the red wolf (*C. rufus*) of Texas, and the dusky wolf (*C. nubilus*) of the central plains, while in the far North the Arctic wolf (*C. albus*) is nearly pure white with a black tail-tip. The gray wolf was formerly very abundant and troublesome in most parts of North America, but has more rapidly and completely succumbed to the march of civilization here than in Europe, and long since disappeared from even the forest-clad portions of the Eastern States. At the present time wolves are practically extinct in the country east of the Mississippi River, but still roam in large packs in the Northern and Western forests and wooded swamps, and are especially large and plentiful in Newfoundland and the Hudson Bay region. Owing to their activity and restless wandering habits small parties are likely to appear in the winter at places where none have been known for years. As the habits of all large wolves are essentially similar the following account of the European wolf (*C. lupus*), which has remained much more generally plentiful and troublesome than ours, will answer for the whole group:

Wolves inhabit a great variety of country, both hill and plain, especially thick forests and broken ground, with alternate morasses and dry patches, and in the South the steppes. They shelter in woods, marshes, canebrakes, and maize fields, roaming over wide areas, often suddenly appearing where none have been seen for years, and as quickly vanishing — nor is this wonderful when it is remembered that they will cover from 25 to 40 miles in a single night. In the neighborhood of dwellings they only appear after twilight, but in secluded places carry on their hunting all day. Their food varies according to the season, consisting in summer almost exclusively of wild animals — foxes, hedgehogs, mice, birds, reptiles, and even vegetables; of larger animals, elk and deer, while hares are soon exterminated where wolves abound. While readily associating and interbreeding with large domestic dogs which have run wild they frequently attack and devour house dogs and even weak or injured members of their own species. They follow herds of lemmings in their migrations, and will devour carrion with avidity; but they do not appear to attack man unless in large numbers or pressed by hunger. Accounts of such attacks in the latter part of winter are frequent in the European press and are occasionally reported from the woods of Minnesota, Michigan, and the Canadas. In winter they approach nearer to human habitations, doing much damage to flocks of sheep and poultry. When in packs they will attack horses and cattle. In the chase the wolf exhibits all the cunning of the fox, and in addition courage and the capability of hunting in packs. These will even divide in parties, one following the trail of the quarry, the other endeavoring to intercept its retreat. In mental qualities the wolf is in every respect the equal of the fox; his caution is so great that he regards every unfamiliar object with suspicion, will not pass through a door if he can leap

over the wall, and will not, unless famished, attack a tethered animal lest it should be the bait of a trap. When he sees himself captured his courage and ferocity at once forsake him.

In spring and summer wolves are solitary or in pairs, in the autumn in families, and in winter in packs. The pairing season is in December and January, when the males fight savagely together; those who are fortunate enough to secure a mate remain with her till the young are well grown. The young are born in burrows usually excavated by the wolves themselves, and during her confinement the female is fed by the male. The period of gestation is 63 days, and from three to nine (usually four to six) cubs are found in a litter; these are blind for 21 days, and are suckled for two months, but at the end of one month are able to eat half-digested flesh disgorged by the mother. They quit the parents in November or December, but many remain together six or eight months longer; they are full grown in three years, and live from 12 to 15 years. Wolves can readily be tamed when taken young, and then exhibit many of the characteristics of domestic dogs.

Notwithstanding the spread of civilization, the wolf is still widely distributed. Excluding thickly populated regions, it extends over almost the whole of Europe; but Russia and Scandinavia are the only parts where it now occurs in any large numbers. In Asia it is spread over all the continent to the borders of India and the plains of China.

Besides the American forms already mentioned many wolves inhabiting Europe and Asia have been described as species more or less distinct from *C. lupus*. Among these are *C. niger* and *C. langifer* of Tibet, *C. pallipes* of India, *C. hodophylax* of Japan, and *C. mexicanus* of Mexico. The Indian wolf (*C. pallipes*) is smaller and slighter than the typical form, with little or no under-fur; but undoubted examples of *C. lupus* differ as much from each other as this does from them. It inhabits the plains south of the Himalayas, but is rare west of the Indus. It does not hunt in large packs, but in numbers of six or eight at most. The superstition of the people prevents its destruction, for they imagine that its blood will diminish the fertility of the fields. It is seldom heard, not howling like the European wolf. It is remarkable even among wolves for speed and endurance.

A second well-marked species of *Canis* found in North America is the prairie wolf (*C. latrans*). (See COYOTE.)

In Africa and South America a number of species of hunting dogs belonging to *Canis* and related genera are known locally as wolves, but the name is not properly applicable. Still less should it be applied to the "native wolf" of the Tasmanians, which is a true marsupial (*Thylacinus cynocephalus*) of carnivorous habits and canine aspect.

Consult: Mivart, 'Monograph of the Canidae' (London 1890); Morriam, 'Revision of the Coyotes,' 'Proceedings,' Biological Society of Washington (1897); Baird, 'Mammals of North America' (Washington 1859).

Wolf-fish, a large voracious sea-fish (*Anarrhichas lupus*), allied to the blenny, and named from the wolfish appearance given it by its great interlocking front teeth, and from its disposition to fight hard for its life when caught.

WOLFBORO — WOLFF

It may attain a length of four or five feet. The color is an olive-green above, marbled with brown on the head especially. The fish feeds on echinoderms, mollusks, and crustaceans. The flesh tastes like that of cod. Several other species are known in various parts of the world constituting the family *Anarrhichida*.

Wolfboro, N. H., town in Carroll County; on Lake Winnepiseogee, and on the Boston & Maine Railroad; about 43 miles northeast of Concord. It contains five villages. It has marble and granite works, boot and shoe factories, woolen mills, carriage and wagon works, flour mill, and lumber works. The town has five churches, graded schools, Brewster Academy, and a public library. The bank has a capital of \$50,000. Pop. (1890) 3,020; (1900) 2,390.

Wolfe, wülf, **Charles**, Irish poet: b. Dublin 14 Dec. 1791; d. Cove of Cork (now Queens-town) 21 Feb. 1823. He was graduated at Trinity College, Dublin, in 1814, was tutor there the next year, took orders in the English Church in 1817, and was curate of Donoughmore, Ireland. The poem which has secured his fame, 'Ode on the Burial of Sir John Moore,' was published in the 'Newry Telegraph' (1817). Wolfe was also the author of several other poems, and his 'Remains,' with a 'Brief Memoir,' were published in 1825.

Wolfe, **James**, English general: b. Westerham, Kent, 2 Jan. 1727; d. Quebec, Canada, 13 Sept. 1759. He was educated at Westerham and Greenwich, and in 1742 received an ensign's commission in a foot regiment. In 1743 he took part in the famous battle of Dettingen; in 1744 obtained his captaincy; and in 1745-6 was present at the battles of Falkirk and Culloden. In 1747 he was wounded, though not seriously, at the battle of Lawfeldt, and from 1749 to 1757 was engaged in garrison duty in Scotland and England. In the mismanaged expedition against Rochefort (1757) Wolfe acted as quartermaster-general and the only creditable movement in the affair was a night reconnaissance conducted by him which penetrated two miles into the enemy's country. His recommendation in favor of an immediate attack, and his offer to take the place with 500 men and three ships, were unheeded; but Pitt, becoming acquainted with the facts of the case, kept the young officer in view for some future enterprise. This occurred in the following year, when Wolfe was ordered to accompany the expedition under Amherst to Cape Breton, with the rank of brigadier-general. A brilliant success was obtained in the capture of the strong fortress of Louisburg, after a seven weeks' siege, and he became popularly known as the "Hero of Louisburg." Pitt was then planning the overthrow of the French dominion in North America by the capture of their chief stronghold, Quebec, and with the instinct of genius singled out Wolfe as the most promising young officer in the army, to command the expedition, notwithstanding many older officers might by virtue of seniority have claimed the honor. Wolfe was accordingly created a major-general, and on 26 June 1759, landed his forces on the Isle of Orleans, opposite Quebec. The system of defense adopted by his adversary, Montcalm, was such as to offer no point of advantage. The season during which operations could be continued rapidly advanced, but at last having dropped down the

river, and scaled the precipitous cliffs known as the Heights of Abraham at a point insufficiently guarded, at daybreak of 13 September Wolfe found himself on the Plains of Abraham, where, his supplies thus cut off, Montcalm had no choice but to give battle. After a short struggle the French were driven from the field in complete rout; Montcalm was one of the 500 killed; the capitulation of Quebec followed five days after; and its fall decided the fate of Canada. Wolfe died in the hour of victory. In person he led the right, till thrice wounded, he was carried to the rear. He lived to hear the cry, "They run; see how they run!" and expired with the words, "Now God be praised, I will die in peace." His body was taken to England and buried in Greenwich Church, and a monument was erected to him in Westminster Abbey. Consult: Wright, 'Life of Major-General James Wolfe' (1864); Parkman, 'Wolfe and Montcalm' (1892); Bradley, 'Wolfe,' in 'English Men of Action' Series (1895); Allison, 'Memoir of Wolfe' in 'Twelve English Soldiers' Series.

Wolfe, **Theodore Frelinghuysen**, American author: b. Kenil, N. J., 1847. He was graduated from the medical department of Columbia in 1868, and for several years practised his profession in Jersey City, N. J. He has published: 'Literary Shrines of American Authors' (1895); 'A Literary Pilgrimage Among Haunts of British Authors' (1896); 'Literary Haunts and Homes of American Authors' (1898); 'Literary Rambles at Home and Abroad' (1900).

Wolfe Island, Canada, at the northeast end of Lake Ontario, bisects the outlet of Saint Lawrence River, and is about 18 miles long, with a maximum width of seven miles, and an area of 34,806 acres. It belongs to Frontenac County, Ontario, is the largest of the famous Thousand Islands, and is opposite Cape Vincent, New York State. Its coast is indented with picturesque bays, it is well-wooded, and the surrounding waters abound with fish. Pop. (1901) 1,796.

Wolfenbüttel, wölf'en-büt-těl, Germany, a town of Brunswick, on the Ocker, seven miles south of Brunswick. One of the ancient churches contains many of the tombs of the princes of Brunswick. The old castle now accommodates a seminary for teachers and a theatre. The library opposite, built in 1723 in the form of the Pantheon at Rome, became famous for its literary wealth, and for the fact that Lessing (q.v.) was its librarian. It was Lessing who edited the "Wolfenbüttel Fragments," professedly from anonymous manuscripts under his charge, but really from the pen of his friend Reimarus (q.v.), which startled the theological world of Germany. The Pantheon building had become so rickety and dangerous that it had to be taken down, being superseded in 1887 by a handsome new edifice, which houses 300,000 volumes and 10,000 manuscripts. There are in the town manufactures of machines, copper goods, flax, cloth, corks, leather, preserves, tobacco, etc. The place is very ancient, and dates from 1046; it was besieged and taken in 1193 and 1542; and during the Thirty Years' war a battle was fought here in 1641. Pop. (1900) 17,873.

Wolff, wölf, **Albert**, German sculptor: b. Neustrelitz, Mecklenburg, 14 Nov. 1814; d. Ber-

lin 20 June 1892. In 1831 he entered Rauch's studio in Berlin, and in 1844 was sent to Carrara to execute the sculptures for the terraces of the Sanssouci palace. Upon his return from a sojourn in Italy of nearly two years, he assisted Rauch in the completion of the latter's Frederick the Great memorial for Berlin. In 1849 he became a member of the Berlin Academy, in 1858 professor there, and in 1866 a member of its senate. He was three times the victor in competitions for equestrian statues — in 1861 for that of King Ernest August (Hanover), in 1875 for that of King Frederick William III. (Berlin), and in 1885 for that of Gen. Artigas (Montevideo). Among his further works are busts of German notabilities, including von Moltke; a decorative bronze group, 'The Lion-tamer,' for the Berlin Museum building; colossal statues of the 'Four Evangelists' for the Schlosskirche, Neustrelitz; and other portrait and ideal productions.

Wolff, Albert, French journalist: b. Cologne, Germany, 31 Dec. 1835; d. Paris 22 Dec. 1891. He studied at the University of Bonn, settled in Paris in 1857, where he became secretary to Alexandre Dumas, Père, and in 1859 began to contribute to the 'Gaulois,' 'Figaro,' 'Charivari,' etc. Some of these articles, collected in book form, were afterward published as 'Memoirs of the Boulevard,' (1866); 'The Two Emperors' (1871); 'Victorien Sardou and Uncle Sam' (1873); etc. He wrote also several novels and farces.

Wolff, Christian, German philosopher and mathematician: b. Breslau 24 Jan. 1679; d. Halle 9 April 1754. He studied at Jena theology, mathematics, and philosophy, paying particular attention to the writings of Descartes and Tschirnhausen, and writing an elucidatory commentary on the 'Medicina Mentis' of the latter, which circumstance was the occasion of an intimacy between him and Leibnitz. In 1707 he was called to Halle as professor of mathematics. By his rationalistic views he here incurred the hostility of certain theologians who denounced him and by an order from the government of Frederick William I. he was commanded (1723) to resign his office, leave Halle in 24 hours and the Prussian States in two days. But he was ultimately vindicated and in 1740 appointed by Frederick II. vice-chancellor and professor in the University of Halle. Three years later he was made chancellor of that university. The principal service rendered by Wolff to the progress of learning consisted in his persistent application of mathematical methods to the investigations of physical science. The decided rationalism which characterized his philosophical doctrine resulted in a popularization of the Leibnitzian teaching. While appropriating many of the conceptions of Leibnitz he controverted his monadology, and regarded the theory of pre-existent harmonies as a mere hypothesis, while he asserted the possible interaction of body and soul. He followed Kant's 'Critique of Pure Reason' in dividing philosophy into Ontology, Cosmology, Rational Psychology and Natural Theology. His collected works make up 22 volumes. Consult: Arnsperger, 'Christian Wolff's Verhältniss zu Leibnitz' (1897); Lewes, 'Biographical History of Philosophy'; Watcke, 'Wolffs eigene Lebensbeschreibung' (1841).

Wolff, Emil, German sculptor: b. Berlin 2 March 1802; d. Rome, Italy, 29 Sept. 1879. He was a pupil of his uncle, Gottfried Schadow, and having gained a prize at the Royal Academy of Arts, went to Italy in 1824 as a pensioner of Frederick William III., and ever after resided in Rome. He held high rank among German sculptors, and executed many Greek mythological and genre statues which have been greatly admired. In portraiture busts of Niebuhr, Thorwaldsen, Winckelmann and Bunsen are among his masterpieces.

Wolff, wülf, Ger. völf, **Joseph**, Anglo-German missionary: b. Weilersbach, near Bamberg, Germany, 1795; d. Isle Brewers, Somerset, 2 May 1862. He was the son of a rabbi, but became a Christian, taught Hebrew for a time at Frankfurt and Halle, studied at Munich, Weimar, and Vienna, and in 1815 went to Rome. He entered first the Collegio Romano, and in 1817 the college of the propaganda, intending to become a missionary. Dismissed for heresy in 1818, he went to England, joined the English Church, spent two years at Cambridge, studying oriental languages, preparatory to going as a missionary to the Jews in Palestine, and in April 1821 embarked for Gibraltar. After an extensive tour in the East he returned to England in 1826. In 1827, he married Lady Georgiana Walpole, a daughter of the Earl of Orford, and in April of the same year set out on another missionary tour, and at Jerusalem was poisoned by some bigoted Jews and narrowly escaped death. On his recovery he set out for Bokhara by way of Persia and on the journey encountered the plague, was repeatedly robbed, was taken prisoner and sold as a slave, but finally reached Bokhara. He spent some time in Abyssinia, acquired the Amharic language, and returned to England in 1834. In January 1836 he again visited Abyssinia, where he was worshipped by the natives as their new aboona or patriarch, visited the Rechabites of Yemen, met a party of Wahabees in the mountains of Arabia, who horsewhipped him because they could find nothing in the Arabic Bibles he had given them about Mohammed, and in August 1837 came to New York. Here he received deacon's orders in the Protestant Episcopal Church, visited the principal cities, preached before Congress, and in January 1838 returned to England. He next visited Dublin, received priest's orders, and held several curacies in England. He went again to Bokhara in 1843 in the employ of the English government to obtain the release of Colonel Stoddart or Captain Connolly, but was imprisoned and saved from death only by the efforts of the Persian ambassador. He then returned to England in 1845 and after this eventful career spent the rest of his life in charge of the secluded parish of Isle Brewers, Somerset. He published: 'Researches and Missionary Labors among Jews and Mohammedans' (1835); 'Journal of Missionary Labors' (1839); 'A Narrative of a Mission to Bokhara' (1845); 'Travels and Adventures,' an autobiography (1860); etc.

Wolff, völf, **Julius**, German poet and novelist: b. Quedlinburg, in the Harz Mountains, 16 Sept. 1834. In 1869 he founded the 'Harz News,' and in 1870-1 served in the German army and won the Iron Cross. He then settled in Berlin and devoted himself to literary work.

His chief works are: 'Aus dem Felde,' war poems (1871); 'Tyll Eulenspiegel Redivivus' (1814, 23d ed. 1896); 'The Rat-catcher of Hameln' (1876); 'The Wild Huntsman' (1877); 'Tannhauser' (1880); 'Lurlei' (1880); 'Der fahrende Schüler' (1900); while among his novels may be cited 'Der Süßmeister' (1883); 'Der Raubgraf' (1884); 'Die Hohnkönigsburg' (1902). Consult Ruhemann, 'Julius Wolff und seine Dichtungen' (1886).

Wolff, Oskar Ludwig Bernhard, German improvisator and novelist: b. Altona, 26 July 1799; d. Jena 16 Sept. 1851. He studied medicine in Berlin and subsequently history and philosophy. He became professor of modern languages at Weimar, in 1826, and of modern languages and literature at Jena, in 1832. He published: 'Pictures and Songs' (1840); 'Natural History of the German Student' (1841); 'Bubbles and Dreams' (1844); 'The Minor Ills of Human Life' (1846); 'History of the Novel' (2d ed. 1850); etc., and edited: 'Treasury of National Poetry' (4th ed. 1853); 'Treasury of German Prose' (11th ed. 1875); 'The German People's Treasury of Poetry' (28th ed. 1884); etc.

Wolfhound, a dog kept and trained for the pursuit of wolves. The ancient Irish wolfhound, now extinct, was of two kinds. One was a tall shaggy, swift-running dog, somewhat like the modern Scottish deerhound; the other more nearly resembled a mastiff, and similar dogs have been known in Spain under the name of wolf dogs. The modern Russian wolfhound is the beautiful borzoi (q.v.).

Wolframite, a native tungstate of iron and manganese in varying proportions, having the formula $(\text{Fe}, \text{Mn})\text{WO}_4$. It occurs in flat, monoclinic crystals, with eminent cleavage parallel with the clinopinacoid. It is brittle, has a hardness of 5 to 5.5 and a specific gravity of 7.2 to 7.5, or about that of iron. It has a sub-metallic lustre, while it is almost or quite opaque and its color and streak are black or nearly black. It is thus distinguished from the closely related mineral hübnerite. It usually occurs in quartz veins, frequently associated with cassiterite or scheelite. It is of considerable commercial importance as a source of tungsten, the ferro-tungsten used in making tungsten steel being derived from it. Its best-known localities are in Bohemia, Saxony, and England, but the recent increased demand for it has brought other localities into prominence, among which are those of New South Wales, Argentina, and Connecticut. Much so-called wolframite is really hübnerite.

Wolf's-bane. See ACONITE.

Wolgast, wöl'gäst, Germany, a town of Pomerania, Prussia, on the left bank of the Peene; four and a half miles from its influx into the Baltic, and 40 miles southeast of Stralsund by rail. Its harbor is shallow, and larger vessels load and unload on the Ruden, an island at the river mouth. Wolgast has the remains of an old castle, the ancestral seat of the Dukes of Pomerania. Its industries are weaving, boat building, and the manufacture of leather and tobacco. It has also an active trade in ships' stores. Wolgast, which was strongly fortified early in the 12th century, was destroyed in 1628 by Wallenstein, in 1630 by the Swedes, in 1637 by the Im-

perialists, and in 1638 again by the Swedes. In 1675 it was taken by the Great Elector, was plundered by the Russians in 1713, and by the Swedes again in 1715. But small remains now exist of its former fortifications. Pop. (1900) 8,251.

Wollaston, wul'as-tôn, **William Hyde**, English chemist: b. East Dereham, Norfolk, 6 Aug. 1766; d. London 22 Dec. 1828. He was educated at Cambridge and was graduated in medicine in 1793. He practised as a physician in Bury Saint Edmunds and then removed to London, where he presently devoted himself to scientific research, becoming secretary of the Royal Society in 1806, and its president in 1820. He was the inventor of the goniometer, an instrument for measuring the angles of crystals, and the discoverer of palladium and rhodium, in 1803, and the malleability of platinum, for which latter discovery he received the medal of the Royal Society in 1820 and which brought him \$150,000.

Wollaston Lake, Canada, a lake of Athabasca, in the Northwest Territory. It is about 50 miles long and has its outlet in the Mackenzie River.

Wollaston Land, Canada, a region of Franklin territory, lying west of Victoria Land, in the Arctic Ocean.

Wollastonite, one of the pyroxene group of minerals, crystallizing, therefore, in the monoclinic system. Its crystals are usually tabular, to which fact its name "tabular spar" is due. Crystals are, however, rather rare, the common occurrences being compact or in aggregates of brittle fibres, having a splintery fracture. Its hardness is 4.5 to 5, and specific gravity 2.85. Its lustre is vitreous to pearly and its usual color is white or gray. Some localities yield specimens which show excellent triboluminescence. It is a calcium metasilicate, CaSiO_3 . Its most important American localities are in northern New York. It was named in honor of the eminent English chemist, W. H. Wollaston.

Wollin, wöl-lên', Germany, an island of Prussia at the mouth of the Oder; on the north side of the Great Haff; length, 20 miles; breadth from 3 to 10 miles. Fishing and cattle-rearing are the chief occupations. Pop. 14,000.

Wollstonecraft, wul'stôn-kraft, **Mary**. See GODWIN, MARY WOLLSTONECRAFT.

Wolseley, wulz'li, **Sir Garnet Joseph**, 1st Viscount, British soldier: b. near Dublin 4 June 1833. He entered the army in 1852 as an ensign, served in the Burmese war of 1852-3, went through the Crimean campaign and was severely wounded before Sebastopol. For his services here he was made a member of the Legion of Honor, and in 1855 was advanced to the rank of captain. He saw active service in India during the Mutiny, from 1858 to 1860 was attached to the Bengal command, and took part in the brief China war of 1860, and in 1865 attained the rank of colonel. He was assistant quartermaster-general and deputy quartermaster-general in Canada 1867-70, and in the latter year led the successful Red River expedition against Louis Riel. On leaving Canada he received the appointment of assistant adjutant-general at headquarters, a post which he held till 1873. In the Ashanti war in 1873-4 his admirably planned march resulted in the capture of Kumasi, the

WOLSEY

native capital, and led to the securing of British authority on the Gold Coast. In 1875 he went to Natal as imperial commissioner, in 1878 was promoted to the rank of lieutenant-general, and went to Cyprus in the capacity of high commissioner and commander-in-chief. Leaving Cyprus next year he was again sent to South Africa, this time as governor and high commissioner of Natal and the Transvaal in order to finish the Zulu war and check the advance of Secocoeni. On returning home in 1880 he was appointed quartermaster-general of the army, a post which he held till 1882, when he was advanced to the rank of general, and as commander-in-chief conducted the campaign in Egypt against Arabi Pasha, which ended in the utter defeat of the latter at Tel-el-Kebir. For this he was raised to the peerage as Baron Wolseley of Cairo and of Wolseley, in the county of Stafford. He commanded the Nile expedition of 1884-5, which was sent too late to relieve General Gordon in Khartum, and on his return was created Viscount Wolseley of Wolseley, and made a Knight of the Order of St. Patrick. In 1890 he was appointed to the command of the forces in Ireland, becoming at the same time privy-councillor of Ireland, and in 1895 succeeded the Duke of Cambridge in the post of commander-in-chief in the United Kingdom. He was succeeded in the latter post by Lord Roberts, on his return from South Africa in 1900. He has published: 'Narrative of the War with China in 1860' (1862); 'The Soldier's Pocket-Book for Field Service' (1869); 'The Life of John Churchill, Duke of Marlborough, to the Accession of Queen Anne' (1894); 'The Decline and Fall of Napoleon' (1895). Consult Low, 'Mémorial of Sir Joseph Garnet Wolseley' (1878).

Wolsey, wúl'zī, **Thomas**, English statesman and cardinal: b. Ipswich, Suffolk, March 1471; d. Leicester 29 Nov. 1530. He was the son of a butcher and was sent to Magdalen College, Oxford, of which he became a bachelor at 15, and was elected fellow. Being appointed master of a grammar-school dependent on the college, he had three sons of the Marquis of Dorset under his care, which led that nobleman to present him to the living of Limington, in Somerset. He was afterward chaplain to the archbishop of Canterbury, then to one of the governors of Calais, and finally was recommended to Henry VII., who made him one of his own chaplains. Under Henry VIII. his progress in advancement was very rapid. In 1509 he was made dean of Lincoln; in 1510 became rector of Torrington; in 1511, canon of Windsor, registrar of the order of the Garter, and privy councillor; in 1513, dean of York and bishop of Tournay (being then in France); in 1514, bishop of Lincoln and then archbishop of York. In 1515 Pope Leo X. elevated him to the dignity of cardinal, and in the end of the same year Henry made him lord-chancellor. His nomination in 1518 to be the Pope's legate *à latere*, completed his ecclesiastical dignities, by exalting him above the Archbishop of Canterbury. At the time when the rivalry between the Emperor Charles V. and Francis I. rendered the friendship of Henry of great importance Wolsey was treated with the greatest respect by both sovereigns, receiving pensions from each, as well as a third from the Pope. He ultimately, however, favored the side of Charles,

who settled upon him the revenues of two bishoprics in Spain, and flattered him with hopes of the Papal chair, which induced him to involve Henry in a war with France. Insatiable in the pursuit of ecclesiastical emolument, in 1519 he gained the administration of the see of Bath and Wells, and the temporalities of the abbey of St. Albans, his revenues now nearly equaling those of the crown. Part of them he expended in pomp and ostentation, and part in laudable munificence for the advancement of learning. His love of splendor was signally displayed on the Field of the Cloth of Gold in June 1520; his love of learning in his foundation of several lectures, as well as the college of Christ Church at Oxford, and of a collegiate school at Ipswich. He built a palace for himself at Hampton Court, but this he in the end presented to the king. In 1522, on the death of Leo X., and again in 1523, on the death of Adrian VI., he failed to secure elevation to the papacy, and on both occasions attributed his failure to Charles V., to whom he ever afterward entertained a strong aversion. The critical affair of the divorce of Queen Catharine was one of the first steps to his fall. With Cardinal Campeggio he was appointed to determine the legitimacy of Henry's marriage with her, and lost the favor of the king by exposing himself to the suspicion of causing delays in the settlement of the question. He fell still more into disfavor by advising the king against marrying Anne Boleyn, and of course roused the hostility of Anne herself and her friends. Leading nobles deeming this a good occasion for contriving his ruin, caused him to be accused of having in the exercise of his duties of papal legate violated the statute of *præmunire* (1529), and he was convicted. The Dukes of Norfolk and Suffolk were sent to require the great seal from him, he was ordered to quit York Place, his palace in London, and retire to Esher, in the diocese of Winchester, and his lands, goods, and chattels were declared forfeited. Henry still assured him of his protection. Part of his revenues were restored to him, and he was even reinstated in the diocese of York. But Henry did not continue his protection long. Toward the close of the year 1530 he was arrested at his mansion of Cawood, in the diocese of York, whither he had retired, and was ordered to be conveyed to London on a charge of high treason. Illness and mental distress obliged him to stop at Leicester, where he was well received at the abbey and where he died a few days after. Shortly before his death he is said to have exclaimed to the officer appointed to conduct him, "Had I but served God as diligently as I have served my king, he would not have given me over in my gray hairs." There has been considerable disposition in later writers to vindicate the character of this minister; and it must not be forgotten that, in the reign of Henry VIII., who had broken his heart; of Mary, the daughter of the much-injured Catharine; and of Elizabeth, whose mother (Anne Boleyn) was the chief instrument of his downfall, scant justice could be expected to be rendered to the better traits of his mixed character. If he was loose in his morals, grasping in his ambition, and rapacious, he was liberal and even profuse toward his dependents, and in his patronage of letters. He was enlightened far beyond the period in which he lived. As a diplomatist it is

WOLVERHAMPTON — WOMAN, EDUCATION OF

very difficult to say whether his abilities or industry were the most remarkable, and it is to him that England is indebted for the first notion of a vigorous police, and for a regular system in the administration of justice. Consult: 'Life' by Cavendish (1641); and 'Lives' by G. Howard (1824); C. Martin (1862); Williams, 'Lives of the English Cardinals' (1868); Brewer, 'Reign of Henry VIII.' (1884); Creighton, 'Cardinal Wolsey' (1888); Gasquet, 'The Eve of the Reformation' (1892); Gaidner, 'The Fall of Cardinal Wolsey' in 'Transactions of the Royal Historical Society' (1899); Taunton, 'Cardinal Wolsey' (1900); and Gaidner's article in the 'Dictionary of National Biography.'

Wolverhampton, wul-vêr-hämp'tôn, England, a manufacturing town, the "metropolis of the Black Country," is built on an eminence amid a network of railways and canals, 13 miles northwest of Birmingham, and 126 northwest of London. The town stands on the western edge of the great coal and iron mining district of South Staffordshire, so that the vicinity on the south and east is covered with collieries, ironstone mines, blast furnaces, forges, iron foundries, and rolling mills, while on the north and west there is pleasant green country. It was first called "Hamton," and then "Wulfrun-ishamton," after Wulfruna, King Edgar's sister, had founded in 996 St. Peter's Church, which continued collegiate till 1846. Rebuilt during the 13th, 14th, and 15th centuries, and enlarged and elaborately restored. The church is a fine cruciform Gothic edifice, with several notable features and monuments. The other public buildings are all modern and include the town-hall, corn exchange, market-hall, agricultural hall, hospital, post-office, art gallery, drill-hall, etc. The free grammar-school, founded in 1512, occupies handsome new buildings of 1876; and there are also a blue-coat school (1710) and an orphanage (1850). In 1757 Wolverhampton was described as "a great manufacturing town in all sorts of toys, and particularly of locks in the greatest perfection; locks — some 2,000,000 yearly — are still its specialty. The other manufactures include tin plate, japanned goods, enameled hollow wares, edge tools, gas and water tubes, electro-plate, papier-maché, chemicals, etc. Pop. (1901) 94,180.

Wolverine, **Glutton**, or **Carcajou**, a carnivorous mammal (*Gulo luscus*), of the weasel family (*Mustelidæ*), but differing greatly in appearance from the light and slender weasels typical of that family. The wolverine is a short, thick, heavily built animal about 2½ feet long, whose short legs, sub-plantigrade feet, and short, bushy tail add to a decidedly bear-like aspect of body. On the body and especially on the tail the hair is long, coarse, and rough, blackish-brown with a pair of yellowish lateral bands meeting at the root of the tail above. The teeth are 38 in number and the molars are remarkable for their massiveness. The wolverine is a northern animal entering the United States only along the Canadian border, and even there very rare.

Apparently there is no distinction between the glutton of northern Europe and Asia and the American wolverine, and in both Old and New

Worlds this brute is alike hated by woodsmen and trappers for its voracity, native meanness, and cunning. It has the reputation of being the most powerful mammal of its size in existence, and in dogged courage is said to have no equal. Those who have had experience with it place it ahead of even the coyote in craftiness and the ingenuity which it exhibits in finding and robbing the stores of man and beast. It systematically follows the lines of traps set by fur hunters and robs them of both baits and captured animals; but is itself one of the most difficult of animals to take, and succeeds in repeatedly springing and robbing traps set for it, even when most cunningly concealed. Nor is its thieving confined to things edible; sometimes every portable article in a camp equipment will be carried away and hidden by a wolverine. It devours enormous quantities of food and its European name indicates that it is the type of greedy voracity. It lives on hares, squirrels, heavers, mice, foxes, all kinds of ground birds and their eggs, reptiles, insects, and even such large game as reindeer, which it is enabled to secure by its perseverance, great strength, and cunning. An expert tree-climber, the wolverine finds its most congenial home in the great northern forests, but its range extends beyond the tree line to the Arctic shores. Early spring is the mating season, and four or five young are born in June or July in a nest at the bottom of a burrow. The savage courage with which the female will defend her young is almost proverbial among trappers, who dread few animals so much as a mother wolverine with her family. Consult Coues, 'Fur-bearing Animals' (Washington 1877).

Wolverine State, a popular name for the State of Michigan, so called for its abounding in early days with wolverines.

Woman, Education of, the work of the education of women is generally admitted to have advanced further in the United States than in any other nation. In the Oriental countries, with the exception of Japan, education for girls and women is not as a rule considered desirable, and no provision is made for them in the educational systems, except such as is provided for by Christian missionary effort. Japan, with her wonderful advance in civilization since 1868, has advanced in this particular also, and is establishing and encouraging schools for the education of its girls and women. In England and the countries of continental Europe, elementary education is given to boys and girls alike, though in separate schools; the extension of the secondary education to girls has come about entirely during the 19th century, but France and Germany now support a number of girls' schools in which, however, the courses are somewhat different and less severe than those given in the boys' schools; normal schools in Germany are also provided for women. In the United States, public elementary and secondary education is, and from the first has been, given to girls on the same plane and in the same schools with the boys. There are also private schools and seminaries for girls, often of a high grade of scholarship.

Higher Education.—In continental Europe the universities have very generally allowed women to attend their lectures, though many of

WOMAN, EDUCATION OF

these institutions do not confer degrees upon women. (See HIGHER EDUCATION OF WOMEN.) In the United States the higher education of women naturally divides itself into college education designed primarily to train the mental faculties by means of a liberal education, and only secondarily, to equip the student for self-support, and professional or special education, directed primarily toward one of the money-making occupations. Women's college education is carried on in three different classes of institutions: coeducational colleges, independent women's colleges and women's colleges connected more or less closely with some one of the colleges for men.

Coeducation is the prevailing system in the colleges and universities of the United States, being most commonly the custom in the West. (See COEDUCATION.) The colleges especially for women fall readily into three groups: (1) The so-called "four great colleges for women," Vassar, Smith, Wellesley, Bryn Mawr. These four colleges are included among the 58 leading colleges of the United States; they are all included in the 22 colleges admitted to the Association of collegiate alumnae; two of them, Bryn Mawr and Wellesley, are included in the 23 colleges belonging to the Federation of graduate clubs; three of them, Bryn Mawr, Smith and Vassar, are included among the 52 colleges of the United States possessing invested funds of \$500,000 and upward, and two of them, Vassar and Bryn Mawr, are included among the 29 colleges of the United States possessing funds of \$1,000,000 and upward; three of them, Smith, Wellesley, and Vassar, rank among the 23 largest undergraduate colleges in the United States; one of them, Smith, ranks as the 10th undergraduate college in the United States. (2) The women's colleges not included in the list of the most important colleges in the United States, but of exceedingly good academic standing as compared with the greater number of the separate colleges for men and the coeducational colleges included in the 480 enumerated by the commissioner of education, form a secondary class and include such institutions as Mount Holyoke College, Women's College of Baltimore, Wells College, Elmira College, Rockford College, Mills College, etc. (See COLLEGES FOR WOMEN.) (3) The women's colleges affiliated with universities; there are five such colleges in the United States—Radcliffe College, Barnard College, the Women's College of Brown University, the College for Women of Western Reserve University, and the H. Sophie Newcomb Memorial College for Women of Tulane University. The affiliated college in America is modeled on the English women's colleges of Oxford and Cambridge, with such modifications as are made necessary by the wholly different constitution of English and American universities.

Professional Education.—True university instruction begins after the completion of the college course, and very little such instruction is given by any American university except in the so-called graduate schools belonging to the 23 colleges in the United States included in the Federation of graduate clubs. In the following 16 of these 23 graduate schools women are admitted without restriction and compete with men for many of the scholarships and honors: Yale,

Brown, Cornell, Columbia, New York University, Pennsylvania, Columbian, Vanderbilt, Missouri, Western Reserve, Chicago, Michigan, Wisconsin, Minnesota, California, Leland Stanford Junior; Bryn Mawr and Wellesley admit women only; Harvard admits them to certain courses through the mediation of Radcliffe. There remain, apart from the Catholic University, only three graduate schools excluding women: Clark, Princeton, and the Johns Hopkins, and in Johns Hopkins they are admitted to at least one university department—that of the medical school. In these colleges in 1903 there were 1,400 women students, or about 22 per cent of all students. Except in medicine, where women were at first excluded from coeducational study by the strongest prejudice that has ever been conquered in any movement, no important separate professional schools, indeed none whatever, except one unimportant school of pharmacy, have been founded for women only. It is evident also that the number of women entering upon professional study is increasing rapidly. If we compare the relative increase of men and of women from 1890 to 1900 we obtain the following percentages: increase of students in medicine, men, 51 per cent, women, 64 per cent; in dentistry, men, 150 per cent, women, 205 per cent; in pharmacy, men, 25 per cent, women, 190 per cent; in technology and agriculture, men, 119 per cent, women, 194 per cent.

Marriage Rate.—The number of married graduates among the total alumni of American college women has been tabulated as follows:

MARRIAGE RATE OF COLLEGE WOMEN.

	Opened in	Percentage of graduates married
Vassar	1865	35
Kansas	1866	31
Minnesota	1868	24
Cornell	1870	31
Syracuse		
Wesleyan	1871	24
Nebraska		
Boston	1873	22
Wellesley	1875	18
Smith		
Radcliffe	1879	16
Bryn Mawr	1885	15
Barnard	1889	10
Leland Stanford Junior....	1891	9
Chicago	1892	9

Statistics.—In 1902 there were open to women 319 scholarships varying in value from \$100 to \$400 (50 of these exclusively for women) and 2 foreign scholarships (1 exclusively for women); 81 residence fellowships of the value of \$400 or over (18 of these exclusively for women); 24 foreign fellowships of the value of \$500 and upward (12 of these exclusively for women). In 1900 there were studying in the undergraduate and graduate departments of coeducational colleges and universities 17,338 women, and in the undergraduate and graduate departments of independent and affiliated women's colleges, 4,959 women, women forming thus 27 per cent of the total number of graduate and undergraduate students. The 22 colleges belonging to the Association of collegiate alumnae, which are, on the whole, the most important colleges in the United States admitting women, have conferred the bachelor's degree on 12,804

WOMAN IN WHITE—WOMB

women. If we add to these the graduates of the Women's College of Brown University, 102 in number, and the graduates of the 14 additional coeducational colleges included in the 58 most important colleges in the United States, we obtain, including those graduating in 1900, a total of 14,824 women holding the bachelor's degree. There is thus formed, even leaving out of account the graduates of the minor colleges, a larger body of educated women than is to be found in any other country in the world.

Occupations.—It is probable that about 50 per cent of women graduates teach for at least a certain number of years. Of the 705 women graduates whose occupations were reported in the Association of collegiate alumnae investigation of 1883 50 per cent were then teaching. In 1895 of 1,082 graduates of Vassar 37 per cent were teaching; 2 per cent were engaged in graduate study and 3 per cent were physicians or studying medicine. In 1898 of 171 graduates (all living) of Radcliffe College, including the class of 1898, 49 per cent were teaching; 8 per cent were engaged in graduate study; 6 per cent were studying medicine; 17 per cent were unmarried and without professional occupation. In 1900 of 316 living graduates of Bryn Mawr College, 39 per cent were teaching; 11 were engaged in graduate study; 6 per cent were engaged in executive work (including 4 deans of colleges, 3 mistresses of college halls of residence); 1 per cent were studying or practicing medicine, and 26 per cent were unmarried and without professional occupation. See also various articles under EDUCATION.

Woman in White, The, a notable novel by Wilkie Collins, published in 1860. Like his other works of fiction, it is remarkable for the admirable manner in which its intricate plot is worked out, and by many is considered his strongest work.

Woman Worship, a term sometimes applied to the chivalrous reverence for women which is usually characteristic of Teutonic and Celtic nations, and which found expression in the worship of female divinities, typical of feminine virtues, by the pagan ancestors of those nationalities. Primitive nature worship included womanhood among the objects to which divine honors were paid, and the forms which that branch of polytheism took in more developed mythology was undoubtedly an accurate reflection of the state of morals of different races, and woman's position among them.

Woman's Christian Temperance Union, a reform organization founded at Cleveland, Ohio, in 1874; it was the outcome of a woman's crusade against the liquor traffic in the Middle States from 1870 to 1873. In 1903 the "W. C. T. U.," as the organization is popularly called, had regular associations in every State and Territory, with over 10,000 local unions and a total membership of 500,000. An international association was founded in 1883 largely through the efforts of Frances E. Willard, and now has auxiliaries in 40 countries and provinces. The headquarters of the American association are at Evanston, Ill. The white ribbon is the general badge of the organization. The union has upward of 50 distinct departments of work, presided over by women experts in various lines. All the States except one have laws requiring the study of scientific temperance in the public

schools, and all these laws were secured by the Woman's Christian Temperance Union; also the laws forbidding the sale of tobacco to minors. The first police matrons and most industrial homes for girls were secured through the efforts of this society, as were the refuges for erring women. Laws raising the age of consent and providing for better protection for women and girls have been enacted by many legislatures through the influence of the department for the promotion of social purity. See also TEMPERANCE; TEMPERANCE SOCIETIES.

Woman's College of Baltimore, located at Baltimore, Md. It was chartered in 1885, and opened to students in 1888; it was founded by the Baltimore Conference of the Methodist Episcopal Church in connection with the celebration of the centennial of the organization of that church. Its aim is to provide a thorough collegiate training for women. The regular four years' course leads to the degree of A.B. This course includes a certain amount of required work, coming mostly in the first two years, but is largely elective; each student is required to elect two major subjects or a major and two minors in different subjects (a major requiring eight hours of class work in one subject, a minor, four hours). Two courses of Bible study are required. Technical courses in music and art are no longer offered by the college; but courses in the theory and history of art are included in the curriculum. A certain amount of gymnastic work is required for the degree. There are two endowed professorships, two lecture funds, and two fellowships for graduate students; the college maintains two tables at the Marine Biological Station at Wood's Holl, and contributes to the support of the American table at the Zoological Station at Naples. The students maintain a general organization for self-government; two literary societies, an art society, pedagogical club, and other special associations; students are required to have the academic cap and gown. The college is situated in the northern central part of the city, in a residential quarter, over a mile from any business section. The buildings on the campus include Goucher Hall (the main building), Bennett Hall and its annex, and Glitner, Fensal and Vingolf Halls (dormitories); a chapel of the Methodist Episcopal church, near the main building, is by arrangement used as the college chapel. The library in 1904 contained over 10,000 volumes; the students numbered 349, and the faculty 25.

Woman's Relief Corps, an organization created by the mothers, wives, daughters, and sisters of Union soldiers of the Civil War of 1861-5, for the purpose of aiding and assisting the Grand Army of the Republic, and to "perpetuate the memory of their heroic dead," to "extend needful aid to the widows and orphans," to "cherish and emulate the deeds of our army nurses." In 1903 there were 3,106 corps and 146,000 members.

Womb, The, and its Diseases. The womb or uterus is one of the generative organs of the female. In its cavity the impregnated ovum is received, retained, and supported during the development of the fetus, and from this cavity the child is expelled at the time of parturition. In the virgin, the womb is pear-shaped, flattened from before backward, and is

about 3 inches in length. It is divided into body and neck. The fundus or upper extremity of the body is broad and convex, and is directed forward. From this portion the body gradually narrows to the neck, the lower rounded and constricted portion of the womb, which is directed downward and backward in the line of the axis of the inlet of the pelvis, and around its circumference is attached to the upper end of the vagina.

The womb is situated in the cavity of the pelvis, between the bladder and the rectum, and is retained in position by ligaments, which in a normal condition of the parts also allow free movements of the womb during respiration, muscular exercise, and change of posture. The ligaments are the two lateral or broad ligaments which pass from the sides of the womb to the lateral walls of the pelvis; the two round ligaments which are attached at the upper angles of the womb, one on each side, and pass out through the internal abdominal rings to end in the labiæ majora; the two anterior ligaments or folds of peritonæum between the neck of the womb and the bladder; and the two posterior ligaments or folds between the womb and the rectum. The womb is a muscular organ, consisting of bundles of unstriped muscular fibres, arranged in layers intermixed with areolar tissue, blood-vessels, lymphatics, and nerves. A serous coat derived from the peritonæum covers the posterior surface of the body of the womb and the upper three fourths of its anterior surface. The cavity of the womb is triangular and flattened from before backward, its base being toward the fundus, and is lined with mucous membrane, having ciliated epithelium at its upper portion. This mucous coat contains the uterine glands, and is continuous with the mucous membrane lining the vagina, and connects with the peritonæum through the orifices of the Fallopian tubes or oviducts, one orifice at each superior angle of the uterine cavity. The two Fallopian tubes (q.v.) are appendages of the uterus attached to its superior angles, and convey the ova from the ovaries (attached to the broad ligaments) to the cavity of the womb. At the inferior angle of this cavity is a small constricted opening, the internal orifice, which leads into the cavity of the cervix. At the vaginal extremity of the uterus is a transverse aperture, the os uteri or external orifice.

The womb is subject to cancerous, fibroid, fibrous, and cystic tumors and polypi, to inflammatory affections of the mucous lining and the parenchyma, such as endometritis and metritis of the neck or body of the uterus; to ulceration of the os and cervix uteri, and to displacement (prolapsus or falling of the womb), versions, and flexions. The causes of endometritis are direct injuries (as from pessaries, chemical irritants, etc.); inflammation of the vagina, interference with the menstrual flow, etc.; of metritis, mechanical and other injuries, sudden suppression of the menstrual flow, endometritis, and morbid growths. Ulceration is usually a complication of endometritis. Among the causes are uterine displacements causing friction against the cervix, abuse of sexual intercourse, vaginal or uterine leucorrhœa, the use of pessaries, and injuries in parturition. Displacements of the uterus are quite common, and among their

causes are: (1) increase in weight of the uterus from inflammation or congestion, tumors, pregnancy, fluid retained in the cavity, etc.; (2) weakening of the uterine supports from rupture of the perinæum, loss of tone of vaginal walls, laxity of uterine ligaments, and degeneration of uterine tissue; (3) influences pressing the uterus out of place, such as tight clothing at the waist, the weight of heavy clothing on the abdomen, muscular efforts, such as lifting and straining, abdominal tumors, distended bladder, etc.; (4) traction on the uterus, from deposits of lymph in pelvic areolar tissue, cicatrices in vaginal walls, shortening of uterine ligaments, etc. Flexions of the uterus are bendings of it forward, backward, or to either side, known as anteversion, retroversion, etc. A prolapsus is a falling or descent of the uterus into the pelvic cavity, or the prolapsed organ may protrude from the body at the vulvar orifice. The first form is known as incomplete prolapsus, the latter as complete prolapsus. The symptoms of uterine diseases include leucorrhœa, pain in the small of the back, dragging sensations, a feeling of weight and heaviness, interference with the functions of the bladder and rectum, dyspepsia, and despondency. See EMBRYOLOGY; MENSTRUATION; OBSTETRICS; OVARY.

Wombat, a burrowing marsupial of the phalanger family and genus *Phascolomys*, natives of Australia and Tasmania. The species most commonly known (*P. wombat*) is 2 to 3 feet long, with a very short tail, clumsy form, stout limbs, blunt muzzle and rough hair of variable tint. In their general form and actions the wombats resemble small bears, having a similar shuffling plantigrade walk; but they are even shorter in the legs and broader in the back than those animals. The dentition resembles that of rodents. They live on the ground and in burrows or holes among rocks, feeding on roots, grass, and other vegetable substances. They sleep in the day, seeking their food at night, and are usually gentle in their habits, though their large chisel-like incisors enable them to bite strongly if provoked. Wombats exhibit small intelligence, but are gentle, and capable of domestication to a limited extent. They are hunted for their flesh, which is highly esteemed, and is said to resemble pork.

Several species exist, besides the one above mentioned. *P. ursinus* is brownish gray, like the third species, the hairy-nosed wombat (*P. latifrons*), which differs from the other two in having smooth silky fur, a hairy muzzle, and large pointed ears. It inhabits southern Australia. The largest living wombat (*P. mitchelli*) is about three feet long, but remains of a large extinct genus (*Phascolonus*), which must have been nearly as large as a tapir, have been found in Queensland. Consult authorities mentioned under MARSUPIALS.

Wombwell, woom'wēl, England, a town in the West Riding of Yorkshire, about five miles southeast of Barnsley, with extensive coal mines in the neighborhood. Pop. (1901) 13,252.

Women in the Industries and Professions. At the opening of the 19th century the position of women, as prescribed by law and custom of the civilized world, was that of complete tutelage to fathers, husbands, and sons. The rehearsal of the laws of the period conveys but slight information concerning the limi

WOMEN IN THE INDUSTRIES

tations imposed upon women, for the unwritten laws of public opinion were often quite as binding; yet clearly to comprehend the significance of the changes in the position of women which have been wrought in the 19th century it is necessary to understand the point of departure. In 1800 the spinster over age and the widow were free by law to collect their own wages and to control their own property, but popular opinion restricted this right. The nearest male relative usually managed the property of such women, and the custom was so thoroughly established that few women dared to become the exception to it. The opinion was likewise widespread and emphatic that no man of pride and resources would permit his womenfolk to labor for money, and the natural corollary of that opinion was another—that the woman who labored for wages was to be pitied as an unfortunate or disapproved as an eccentric. In consequence, many women whose freedom from family cares and natural instincts urged them to enter the field of labor ate the bread of dependence rather than face the condemnation of society. The fact that food and clothing were almost wholly prepared within the home rendered this condition possible and bearable, since such useful and necessary employment was furnished that the dependent relative could more than pay for her keeping by the value of the services she rendered. Women driven by necessity into the world's workshop found few occupations open to their hands, and these so poorly compensated as to offer little more than a bare subsistence. The paid work of women outside was necessarily pitted against the unpaid work of women within the home; while the unrecognized commercial value of both tended to strengthen the opinion generally adopted that women's work was always of an inferior quality.

When Harriet Martineau visited the United States in 1840, she reported having found only seven occupations open to women—teaching, needlework, keeping boarders, working in cotton factories, typesetting, bookbinding, and household service. Of these employments, teaching indicated the highest mental acquirements, but at that date women teachers were confined almost entirely to the primary departments of city schools and to summer terms in country districts. The lack of opportunities for higher education prevented their fitness for the highest positions, and the popular idea of their general incompetency prevented the full recognition of the qualifications they did possess. A dollar a week with "boarding around" was accounted good wages for a woman teacher.

The economic development of the country was the unconscious influence which brought better industrial conditions to women. The establishment of factories gradually removed the manufacture of cloth and clothing from the home. The necessary purchase of these necessities demanded a greater cash income for the family. The man who had supported a family of women when it required but small outlay of money, found himself unable to do so when every comfort demanded a cash investment. The necessities of poverty drove women into the wage-earning occupations, while the changed economic conditions gradually lifted the ban placed upon the woman worker. Meanwhile, the prejudice against education for women was being slowly eradicated, and better opportuni-

ties were offered for their intellectual development. With higher qualifications, there came the demand for better-paid employments, and the gradual opening of new occupations followed.

The real contest centred about the three learned professions, since the opposition there combined the prejudice against the woman worker, the prejudice against financial independence for women, and the skepticism concerning woman's intellectual ability. This portion of the history of the industrial evolution of women offers the truest measure of changed conditions. In the early years of the 19th century the higher vocations were entirely beyond the reach of women. Three distinct and overpowering obstacles stood in the way: (1) The belief, practically universal, that the minds of women were wholly incapable of mastering a college education, and still less the training required by a learned profession; and that their physical strength was insufficient to endure the strain of so long a period of close study. (Oberlin College was opened in 1833, but no women were graduated until 1841.) (2) The belief, quite as universal, that if a woman should receive the necessary professional training, no patrons would reward her, and her preparation, in consequence, would represent a loss of time and money. (3) The popular belief that any woman who would seek to enter a profession must of necessity be masculine, "unsexed," indelicate, and unworthy of public esteem.

Various female medical colleges opened early in the century, and a number of women availed themselves of the opportunities thus offered. Among these were colleges in Boston, New York, and Philadelphia, each sanctioned by the legislatures of their respective States. These colleges, however, owing to public opposition and a meagre attendance, did not reach the high standard maintained by the best colleges for men. Many women graduating from them were forced to go to Paris, London, or Switzerland for the opportunities of advanced study which were denied by American colleges. The difficulties which hindered the practice of those early women physicians almost pass belief. In Philadelphia, in 1850, Dr. Hannah Longshore opened an office, only to find that the men physicians were in league against her and that, at their request, the druggists of the city refused to sell drugs to her, hoping by such action to drive her from the city. In many States women were denied admission to medical societies, and many physicians refused to consult with them. In 1861, the study of surgery and dentistry was opened to women in Sweden, and in 1863 the University of Zürich opened all its departments, including medicine, to women. In 1865, Miss Elizabeth Garrett received the first medical diploma granted to a woman in England. In 1869, women were admitted to the academic departments of the University of Michigan. It was 20 years since the first woman had graduated in medicine, and a significant change in public sentiment had followed, yet when a leading professor in the School of Medicine at Ann Arbor was asked if women were admitted to the medical department also, he gave back the vulgar but suggestive reply: "No, thank God! they can only enter there in the pickling vat." Yet a few years later they were admitted to the medical department.

WOMEN IN THE INDUSTRIES

For many years medical practice of a desirable kind was difficult for women physicians to secure. Patients came at first chiefly from the poor. Women who should, according to theory, have been the best patrons of their pioneer sisters, were influenced by popular opinion and offered neither support nor encouragement. The prejudice which was overwhelming in 1840, has not been entirely eliminated; yet at the close of the century women are admitted to the medical societies of the United States and England, are accepted in consultation with men physicians, and the practice of many of them is large, successful, and lucrative. At the close of the century there are in the United States and Canada 49 medical colleges admitting women, 9 being separate women's schools. Seven hundred graduated women physicians are reported as practising in Russia, several hundred are practising in the British Empire and colonies; there are women physicians in all countries of Europe, in China, Japan, Persia, India, and Egypt; and it is estimated that some 10,000 graduated women physicians are practising in the United States.

In 1850, Antoinette Brown was graduated from Oberlin, and immediately made application to enter the theological department. The president did his utmost to dissuade her, but failing in this he was forced to admit her, owing to the exceedingly liberal character of the college charter. She pursued the entire course, and, despite the fact that faculty and trustees continued their disapproval of her presence there, was graduated with honor in 1853. However, to guard against further applicants the Oberlin charter was so amended as to prevent other women from entering the theological school, and her name was not printed in the list of graduates until 40 years after her graduation. Miss Brown was, shortly after her graduation, ordained by a Congregational church in New Jersey. At about the same date, the Universalist Church ordained the Rev. Olympia Brown. Some denominations did not require a diploma from a theological school as a qualification, and on that account offered easier means of entrance than others; but this advantage, open to men, offered no encouragement to women, since it was offset by the overpowering belief that the ministry of women was contrary to God's word. There are now some 18 denominations, including Friends and the Salvation Army (which do not require ordination), that permit women to preach. Several hundred women are occupying regular pulpits. Those churches whose government is determined by large representative bodies, such as the Methodist Episcopal Conference and the Presbyterian Assembly, have never granted ordination to women. The denominations in which ordination may be secured at the request of a single congregation are those in which women ministers are most numerous. The so-called liberal denominations—Unitarian and Universalist—have ordained the largest number of women in proportion to their total membership. Among the churches which have ordained women are the Unitarian, Universalist, Congregational, Baptist, Free Baptist, Methodist Protestant, Free Methodist, Christian, and United Brethren.

The law was the last profession to admit women, and it will doubtless be the last to concede fair opportunity. Yet the opposition is disappearing, the number of women lawyers is

increasing, and sooner or later the law, too, will unquestionably offer equal chances to women. Permission to practise law in nearly all countries can be obtained only by decree of a court. In several States, courts threw off the responsibility of passing upon the application of women candidates by the decision that a special act of the legislature must first be secured, making women eligible to the profession of law. In 1869, Belle Mansfield was admitted to the bar in Iowa; that same year, Myra Bradwell made application for admission to the bar in Illinois, and was refused. She appealed to the Supreme Court of the United States, which decided that each State must determine the question for itself. Several women are now practising law in Illinois, and many States have admitted them to practice; but in each State a special effort had to be made to secure the right for the first candidate. Western States presented little difficulty, but Eastern States withheld the privilege longer. Several hundred women have since been graduated from law schools, and many are engaged in honorable and lucrative practice. Women have been graduated in law in several foreign countries, but although efforts to secure admission to the bar have been made in Italy, Belgium, Switzerland, and Russia, they have thus far been in vain.

Although woman in the "learned professions" still has difficulties to overcome in addition to those which confront man, it is evident that these are growing fewer every year. Basing one's judgment upon the rapidity with which conditions have changed in the last 50 years, a prophecy may be ventured with safety that in a few years the professional woman and professional man will stand before the world with equal chances of success or failure. The constantly increasing demand of women for work, the gradual decrease of prejudice against the woman worker, and the improved standard of qualification have opened nearly all occupations to women, and all the professions, learned and otherwise, within the last 50 years.

No occupation illustrates more clearly the immensity of the changes wrought than teaching. As early as 1780, women were beginning to teach in country districts, in the summer months, when the schools were small and mainly confined to girls. The wages were much below those paid to men, even for summer schools, while winter schools, attended by boys, were considered quite beyond the capacity of women. The change of opinion has been slow but decided. In some States four fifths of the teachers are women, while for the whole United States more than half the teachers are women. Most Southern States still employ more men than women teachers, but Northern and Western States employ more women than men. In 1880 there were 100,000 women teachers in the public schools of the United States; in 1890, 236,012; and in 1900, over 300,000. The highest positions are usually reserved for men, and there is still unequal pay for equal work in most States. Many professorships in colleges and universities, representing every phase of scholarship, from ancient languages to modern science, and from literature to engineering, are held by women. The profession of teacher is also open to women in foreign countries, though they are mainly confined to positions in primary and intermediate schools. There, as in the United

WOMEN, LEGAL AND POLITICAL STATUS

States, teaching was the first profession to admit women. The universities of Sweden, Italy, and Switzerland have employed women in responsible positions as instructors.

During the 19th century there was a marvelous growth of manufactures in the United States, and women as well as men reaped the advantage. The census for 1900 named 388 distinct occupations, exclusive of clerkships, in connection with manufactures, and women are reported to be employed in 371 of these. It is interesting to note the manufactures where no women have as yet been employed: Foundry supplies, artificial fuel, grindstones, horseshoes, iron and steel doors and shutters, lard oil, neatsfoot oil, resin oil, racking hose, beet sugar, zinc, and preserving wood. In the various industries 846,614 women are employed, as compared with 3,745,123 men. The number of women reported as engaged in gainful occupations in 1890 was 3,914,571, and in 1900 4,800,000.

CAROLINE C. CATT,

National American Woman Suffrage Ass'n.

Women, Legal and Political Status of.

Of all the anomalies which the progress of civilization presents, none is more wonderful than the history of women. Long held as an article of barter and trade, considered even in our own time rather as something to be possessed than as capable of possessing, the sex has yet, in the persons of individuals, been beloved, honored, idealized, crowned, and worshipped. The Christian dispensation has made woman a partaker in the great things of human destiny. Modern democracy has found it impossible to exclude her from its benefits and dignities. Finally, in a country in which education has come to be recognized as the only safeguard of public institutions, the privileges of instruction have been fully secured to her, and the immunities of ignorance have ceased to be considered as her peculiar prerogative. This progress, slow in its inception, long continued to be almost imperceptible. We may even say that at the beginning of the 19th century the legal position of woman was one of passive endurance. In privileged circles and among good people this was not often nor generally realized; but where manners were rude and where the limitations of poverty were felt, wives, and daughters became painfully aware of their pitiful condition before the law. Mothers did not own their children, nor the very garments which they wore. Any money that a married woman could earn or inherit became the property of her husband, and could be taken to pay his debts. In most departments of labor, moreover, a discrimination was made against women workers, and in the few employments in which they competed with men they received for the same service a much smaller compensation. At the time referred to, and for years afterward, a married woman could neither make a will nor enter into a contract without her husband's consent. In the administration of the great interests of the community she had no part and no voice.

Mary Wollstonecraft, in the late 18th century, and Frances Wright, in the early 19th, began to agitate the theme of woman's rights. The expression became at once a synonym for all that is considered unlovely and unfeminine. The advocates of the new theory, few in num-

ber as they were, were forced into a position of social isolation, in which they were commonly supposed to seek the eccentricity which was the inevitable result of the treatment received by them at the hands of the community. After the great liberation brought in view by the teachings of Christianity, the woman-world owes its first emancipation to the Society of Friends, in which were proclaimed the spiritual equality of men and women, and the right of the latter to be recognized as teachers of religious truth. Accordingly, we find Lucretia Mott present at the memorable convention in Seneca Falls, N. Y., in 1848, the first convention held in this country for the consideration of the civil and political rights of women. In this meeting Elizabeth Cady Stanton took a prominent part. With her appeared Frederick Douglass, gifted with so just a notion of the nature of freedom as to regard it as a right of white women as well as of colored men.

The anti-slavery agitation, indeed, carried the woman question along with it in its progress. When its culmination was reached, the champions of the slave became, with few exceptions, the advocates of a freedom which should know no limits either of color or of sex. The exigencies of the Civil War brought numbers of educated women into close and sympathetic relations with each other. They found themselves constrained to act in concert for the relief of the soldiers, for field and hospital service, and for the providing of necessary comforts for the sick and wounded. From this wider outlook the women never went back. The awful experience, too, of the war suggested to them many questions not to be answered by the old methods of reasoning. Lucy Stone, a farmer's daughter, had by long and patient labor enabled herself to acquire a college education. Gifted with a pleasing presence, a beautiful voice, and great force of conviction, she turned easily from the labors against slavery and intemperance, in which she won her early laurels, to the new advocacy which was destined to metamorphose the position of woman throughout the civilized world. In her husband she found a congenial and faithful helpmate. The pair, at first resident in New Jersey, transferred their household belongings to the neighborhood of Boston, from which point they unweariedly visited every part of New England, and much of the far West, pleading everywhere, with eloquent tongues, for the civil and political enfranchisement of women. Then arose pleadings which voiced the complaint of many hearts. Reason, the supreme authority, became convinced. Women said: "It is not right that men should be the sole arbiters of our fortunes. We, as well as they, are guardians of the community. We, with them, must have a voice in its affairs."

A very important part of the advance now noticeable in the legal position of women in Massachusetts is due to the legislative hearings which have been granted to the petitioners for woman suffrage during a long period of years. These hearings naturally were occupied by the prime matters of debate. At the same time, the exposure made of the legal and economic injustice suffered by women did much to stimulate legislative action in their behalf. In the legal profession itself we had some important allies. One of the most efficient of these was the late Samuel E. Sewall, a man greatly be-

WOMEN, LEGAL AND POLITICAL STATUS

loved and honored in his day. This good friend devoted much time to the devising of bills for the amelioration of the legal condition of our sex. Among these I recall the following: A bill enabling a married woman to make a business contract with her husband; one allowing her to make such a will as she should see fit; one giving her a right to her own clothes; one securing to her the right to be buried in the burial-lot of her deceased husband; a bill for the abolition of the widow's quarantine, that is, of the law which forbids her to remain more than 40 days in the house of her deceased husband without payment of rent, the right of the husband in corresponding circumstances being without legal limit. An important measure was brought before the legislature of Massachusetts by the Home Club of East Boston, seconded by the New England Women's Club of Boston. This was a bill ordering that men who walk the streets of cities at night with evidently vicious purposes should be liable to arrest and penalty equally with women of like character and purpose. A very general interest was felt some years ago in Massachusetts regarding what is called the age of consent for young girls. This was first fixed in that State at 10 years: it has been gradually extended to 16 years, which limit was reached in 1893.

Connecticut has the credit of having been the first State which gave to married women the power to make a will. This power the State conferred by act of legislature in 1809. Ohio followed 26 years later, in 1835. In 1836, an endeavor was made by Ernestine L. Rose and Paulina Wright Davis to circulate in New York petitions for property rights for married women. They met with but little success, women and men alike deriding them. Mrs. Rose, however, addressed the legislature of Michigan, asking for the political enfranchisement of women. This is said to have been the first address given by a woman before a legislature. In the same year, Abraham Lincoln made a public declaration of his belief in the propriety of giving the franchise to women, an act which did not interfere with his election, some 24 years later, to the office of chief magistrate of the United States. In 1837, a National Female Anti-Slavery Association held a convention in the city of New York. This appears to have been an entirely new departure for the sex. Angelina Grimké, a Southern lady, who had freed her own slaves, was mobbed in Independence Hall, Philadelphia, for speaking in public against slavery. The Grimké sisters became well known as advocates both of negro emancipation and of the political rights of their own sex. Their labors and those of Abby Kelley Foster and others in behalf of women soon began to bear fruit. In the years that followed, the public conscience became more and more exercised regarding the rights that women should enjoy in a free country. Legislative hearings in their behalf multiplied, and State after State relaxed the rigor of its exclusions. In 1840, Texas gave married women the right to make a will. Alabama did likewise in 1843, Vermont in 1847. In 1848, the State of New York secured to its women the control of property. Pennsylvania added to this the power to make a will. In this year was formed the first local suffrage association, at South Bristol, N. Y.

In 1849, Virginia conceded to wives the right to make a will. Massachusetts gave both powers in 1855, Rhode Island in 1856, Maine in 1857, Wisconsin in 1859, Maryland in 1860. There remain only seven of our States in which women do not enjoy some control of their property.

It would seem that the leaven of a new faith had been working in the community from the early years of the 19th century. This leaven, as was natural, was generated in the minds of men and women eminent in the domain of literature and recognized as leaders in thought. Margaret Fuller, who was born at about this time, devoted the fulness of her remarkable powers to the advocacy of human rights, and pleaded earnestly for the enlargement of education and opportunity for her own sex. In 1852, Mrs. Stowe placed herself in the forefront of the battle against slavery, and revealed to the reading public a power not previously recognized in her sex,—that of setting whole communities aflame with indignation against one form of tyranny. In 1854, Florence Nightingale's energetic services in the Crimean war shed a new lustre upon the annals of her sex. In 1867, John Stuart Mill, eminent as a philosopher and political economist, pronounced in the English Parliament a memorable speech in favor of full suffrage for women.

To return briefly to the record of the States,—the vigorous young Territory of Wyoming, at the first session of its legislature, in 1869, granted full suffrage to women. When, 23 years later, the Territory was admitted to Statehood, its delegates insisted on maintaining in its constitution the right of women to suffrage, and, refusing to enter the Union upon any other terms, carried their point. Municipal suffrage was granted to the women of Kansas by act of legislature in 1887. Finally, but not, we hope, to conclude, Colorado in 1893, and Utah and Idaho in 1896, bestowed upon the women within their bounds suffrage full and equal to that exercised by men.

The new power of eloquence was soon displayed by women when they became persuaded that they had a cause to plead. The walls of public buildings all the country over rang with their appeals for a better administration of justice, a fairer distribution of the functions of society. Mrs. Stanton, the Rev. Antoinette Brown, Susan B. Anthony, Mrs. Mary A. Livermore, and other courageous women spoke in public for reform. Anna Dickinson electrified audiences with her stirring words. Frances Willard won great multitudes to the cause of temperance. Conventions and congresses of women were held, in which the burning questions of the day were discussed from the woman's point of view. Kansas, Wyoming, Iowa, Colorado, heard the new gospel of women's hope—heard and heeded.

The power of associated action among American women has been greatly promoted by an agency scarcely dreamed of 50 years ago,—that of the women's clubs. The time for these had come in the world's economy, and almost simultaneously in two of our leading cities appeared the New England Woman's Club of Boston and the New York Sorosis. Until that time the word "club" was commonly understood to indicate a place, more or less convenient and elegant, where the men could meet together for purposes of business, amusement, or friendly

WOMEN, NATIONAL COUNCIL OF—WOMEN'S CLUBS

intercourse. The first women's clubs were started with the view of affording their members a more sympathetic and profitable communion than that conceded by fashion. The work of these clubs was to be the study of important social questions and the earnest endeavor to promote their true solution. Their recreations were to be furnished from the resources of art and literature. One of them, the Association for the Advancement of Women, originally founded by the New York Sorosis, devoted its energies to the holding of an annual congress of women in various parts of the Union. Wherever those meetings were held numbers of women, usually held apart by personal affairs, came together to welcome the pilgrims who had journeyed from afar. The congress lasted three days, and its sessions were devoted to the discussion of the most important and timely topics. The welcome given to its members, sometimes rather dull and tardy, always warmed into grateful praise. Helpful groups of workers everywhere sprang up in its tracks. When, more than a score of years after its beginning, Sorosis issued a call for a convention of women's clubs, a multitude appeared at her bidding, and a federation of women's clubs was formed which now binds together in amity the women of our whole domain, from Maine to Louisiana, from Massachusetts to California. The results of this wide extension of intercourse between different regions of our country can hardly be overestimated. Under its influence, sectional differences lose their unfriendliness of aspect, and sympathetic accord in the pursuit of worthy objects oversweeps and harmonizes all petty and personal discords.

In the first half of the century there were some seven occupations open to women. The last report of the Commission of Labor enumerates 300 honest ways in which they may gain a livelihood. In the earlier period free speech was denied to women by the great power of public opinion. To-day, the honors and opportunities of the platform belong as fully to women as to their brothers. They are not only permitted, but urgently requested, to use their gift of eloquence in behalf of the most important questions which come before the mind of the community. The very thought of conceding to women a vote on any matter of public interest was derided as ridiculous and intolerable. They have now the right of school suffrage in 22 of our States. In four States full suffrage is secured to them; in one, municipal suffrage.

Although Massachusetts does not lead in the march of woman's political advancement, she has been a strong centre of influence in the progress of the sex. She was first to concede to women the right not only of voting in the election of the school boards, but also that of membership in that important body. The question of school suffrage was first brought forward in Boston by Abby W. May, and the New England Woman's Club, of which she was a beloved officer, was the arena in which were heard the first arguments on the subject. In this same club, one of the earliest formed in the country, many matters of public interest were presented to the consideration of a wide circle of intelligent women. Dress reform, public sanitation, improved dwellings for working people, the beneficent providing of country and seaside outings for the children of the poor—these

and other kindred topics were ably presented to the club, many of whose members became actively engaged in promoting the measures just spoken of. The present state of things leaves us much to hope and work for, but the end, albeit not attained, is yet well in sight.

JULIA WARD HOWE.

Women, National Council of, an annual council of women held in the United States; at which meetings all national societies organized for any purpose whatsoever come to hear what other national societies are doing on other lines. They counsel together as to any reform, or movement, in which all might co-operate. The council has a cabinet, and is fashioned on a plan similar to the Senate of the United States. It is self-supporting, with the aid of patrons. Twenty national societies are represented in the council; they aggregate a membership of 1,200,000 women, the largest representative organization in the world.

Women's Clubs, associations of women organized for purposes of study, recreation, or for the promotion of certain philanthropic or political ends. Organization among women in the United States has grown to enormous proportions. It is impossible to compute with any degree of accuracy the membership of women's clubs, outside the federated bodies. This result has all been accomplished in 55 years.

Suffrage Organizations.—In 1848 Elizabeth Cady Stanton and Lucretia Mott issued the first call for a national suffrage association. These two women presided and organized the association. It had been a disputed question whether any woman could, or would, be able to fill this important position, the decision ultimately being given in the affirmative, by the famous negro orator,—Frederick Douglass. Susan B. Anthony immediately joined the other two women, and from their united efforts, "Individual Clubs" were formed, until in 1903, the "Suffrage" and "Political Equality" clubs numbered 1,000, with an approximated membership of 25,000. Their aim as expressed in their platform being to "promote the educational, intellectual, legal and political equality of women, especially the right of suffrage."

From authentic records it has lately been proven that in 1859 Miss Constance Faunt Lee Roy founded the Minerva, a Woman's Literary Club at New Harmony, Ind. But to Sorosis (q.v.) belongs the honor of being the first permanent woman's club organized, and remaining in existence uninterruptedly to the present time.

Sorosis.—In 1867 the Press Club of New York gave a dinner to Charles Dickens. A number of women who were either actively engaged in literary work, or connected with it in some manner, asked if they could be present at the dinner. It was ruled that they could not, although eventually a compromise was arranged and a few women attended the dinner—in some irregular way, probably as spectators in the gallery. Saint Valentine's Eve 1868 found many of these same women present at the residence of Mrs. Charlotte Willbourn. All expressed their indignation regarding the Dickens Dinner incident, when some brave soul hazarded the question—"Why can not we have a club of our own?" This chance remark was greeted with hearty enthusiasm and instant acceptance, and led to an organization formed by

WOMEN'S CLUBS

32 venturesome women, which terminated in the "Mother Club," Sorosis. The priority of this club is disputed by the "Boston Woman's Club," formed about the same time, but the Boston organization admitted men either as honorary or complimentary members. There had been societies both philanthropic and charitable, usually auxiliary to some male society. Nor were the "Suffragists" all women in their formation. Sorosis was the first woman's club founded exclusively by and for women. The chairman or temporary president was Alice Cary, who presided at one meeting only. Succeeding her as temporary president was Jennie June Croly. It was in 1870 that the first duly balloted for and elected president was placed in office, Mrs. Charlotte Wilbour, who served for five consecutive years, and in 1903 was again elected president, after an interval of 28 years. Sorosis sent in 1873 "a little messenger" to prominent women throughout the whole world, calling together a "congress of women." This act received the commendation of thousands of women, including nearly all the reigning queens. This congress was held in New York at the Union Square Theatre, and formed an "Association for the Advancement of Women," which held congresses annually in various parts of the country, until it was superseded by the General Federation of Women's Clubs.

General Federation of Women's Clubs.—This organization was formed at a meeting called by Sorosis in New York, March 1889. On the same date Sorosis reached its majority, and celebrated its 21st birthday. The Federation was designed to bring in closer touch clubs from all over the country. Its by-laws read:

The General Federation shall consist of Women's Clubs, State Federations, Territorial Federations, National Societies, and kindred organizations, the two latter to be admitted on the basis of individual clubs. Its meetings shall take place every two years, beginning in 1892. The place and date of meeting shall be decided by the Board of Directors. The annual due for clubs shall be at the rate of 10 cents per capita. The annual due for State Federations shall be at the rate of 25 cents per club. The annual due for each local Federation of Clubs shall be at the rate of \$1 per club. Dues shall be paid annually the first of May, beginning with 1900.

Soon after the formation of the General Federation, the different States began to agitate the question of State federations. The first one to organize being Maine, 4 Sept. 1892. The other States rapidly fell into line, until now the General Federation consists of 39 State federations. These State federations are in turn composed of 3,516 clubs with a total membership of 221,000. Beside this there is an independent list made up of 800 individual clubs with membership of 60,750, giving the General Federation a total representation of 281,750 women. Many of the clubs have also formal county and city federations, and there are councils of various sorts too numerous to specify. Federating has in fact become the order of the day.

State Organizations.—The clubs of Arizona are devoted to literature, household economics, philanthropy, art, music, forestry and manual training. In Arkansas the clubs belong to the departmental study class, the largest organizations being the *Æsthetic Club* and the *Co-operative Club of Little Rock*, and the *Pacaha of Helena*. The subjects occupying the clubs of California are California history and landmarks, libraries and "portfolios," civics, house-

hold economics, education, forestry, and the usual departmental work. The largest clubs are the California Club of San Francisco and the Oakland Club. In Connecticut the largest clubs are the Woman's Club of Ansonia (278 members) and the Woman's Club of Waterbury (250). In Florida eight of the clubs represent the village improvement idea. They have accomplished a large amount of work in building shell roads, planting shade trees and beautifying the cemeteries. The Palmetto Club of Daytona maintains a kindergarten and day nursery for negro children. The largest club is "The Woman's Club" of Jacksonville with 120 members. In Georgia the federation committees represent the following departments: Education, music, social service and reform, industries, arts and crafts, village improvement, law-library. The Federation owns one traveling library. The village improvement and garden committee has accomplished a great deal in beautifying the streets, parks, school buildings, cemeteries and driveways of the State. Illinois is next to New York in the total number of women represented in federated State Clubs. The largest membership is found in the Chicago Teachers' Club with 3,378 members, and Chicago Woman's Club, 916. A school of Domestic Arts and Science has been established in Chicago, as also cooking classes in the public schools and dress-making in the vacation schools. Art has been promoted throughout the State by means of eight traveling picture galleries of photographs. There are 225 traveling libraries which are loaned to clubs for a period of six months. Philanthropy has been active in the establishment of a colony for the 10,000 epileptics of the State. Indiana's largest clubs are the Progress Club of South Bend, the Woman's of Indianapolis, the Century and Over the Teacups of Greencastle. The Woman's Club of Greencastle is the oldest in the State, having been organized in 1874, but it does not belong to the State Federation. All the clubs belong to the department study class. In Iowa the Dubuque Woman's Club is the oldest club, having been formed in 1876. The most prominent is the Des Moines Woman's Club, with its membership of 335. The Iowa State federation claims the honor of being the first to join the General Federation. Clubs of Iowa belong to the departmental study class, their special lines of work being village improvement, art in public schools, domestic science, child study, and development of the library system. The Kansas State Social Science Federation was organized in 1895. The largest clubs are the Hutchinson Woman's Club with 150 members and the Leavenworth Art League, 108 maintaining an art school. The clubs are all working in the department study line and are divided up into many small district federations. The Ladies' Library Association of Independence supports a public library of 3,000 volumes. The Woman's Club of Central Kentucky, in Lexington, the Woman's Club of Louisville and the Louisville Alumnae Club are of equal prominence in Kentucky. The Woman's Emergency Club of Louisville has the largest membership, 3,000. The 46 clubs of the State are devoted to a variety of objects,—art, literature, economics, current events, history, education, civics, music, child study and philanthropy. Social settlement in the Kentucky Mountains is a most important club work. The Maine State Federation

WOMEN'S CLUBS

was organized September 1892, being the first State Federation formed. The largest club is the Literary Union of Portland 632 members, which has introduced manual training and cooking in the public schools. The federation has secured legislation favorable to forestry; also an appropriation for a chair of forestry in the University of Maine, and has established many libraries. All Maine clubs belong to the study class, with two exceptions, the Mount Holyoke Alumnae Association, and the Education Industrial Union of Saco. In Maryland the largest clubs are the Arundel and the Council of Jewish Women, both of Baltimore, and having 400 members each. Federation clubs have established traveling libraries and free kindergartens. There are four clubs formed of alumnae, one for mothers, others that represent village improvement, art, philanthropic and literary interests; a Teachers' Educational Union and a Press Association. Michigan has county and city federations. Her largest clubs are the Twentieth Century of Detroit, Ladies' Literary of Grand Rapids, Woman's League of Battle Creek, and Ladies' Library Association of Kalamazoo. In Minnesota the largest clubs are the Twentieth Century Club of Duluth, Improvement League, Ladies' Thursday Musical and Teachers' Club, all of Minneapolis; and the Saint Anthony's Park Association, Grade Teachers Association and Schubert Club, all of Saint Paul. The club known as the Territorial Pioneers, of the same city, has secured a State park or forest reserve of 12,000 acres, and 200,000 acres pine land to be cut under forestry regulations; and has a yearly appropriation from the State for a State art society, also an appropriation of \$6,000 yearly for a State traveling library. Of the Minnesota clubs, 188 can be classed as study clubs. In addition to those mentioned there are three clubs devoted to civics, the Women's Auxiliary to the State Horticultural Society and the Winnebago Woman's Club. The most prominent clubs of Missouri are: Wednesday Club, Saint Louis; The Athenæum, Kansas City; Woman's Club, Marshall; Tuesday Club, Saint Louis; Woman's Club, Boonville; Domestic Science Club, Chillicothe; Tuesday Club, Columbia; Women's Club, Hannibal; Emerson Club, Joplin; Runcie Club, Saint Joseph; Shakespeare Club, Lebanon; Sorosis, Sedalia; Ladies' Saturday Club, Springfield; Monday Club, Webster Groves. The clubs all belong to the departmental study class. Their special work is represented by a large number of traveling libraries, vacation schools and playgrounds, with one art exhibition gallery. In Nebraska the largest clubs are the Woman's Club of Omaha with 426 members, and the Woman's Club of Lincoln, 625. The clubs of Nebraska have built up many free libraries, both stationary and traveling, and have also successfully run the Pingree Seed Garden for supplying free seed to the poor. The clubs of this State belong to the miscellaneous study class. In New Hampshire the largest club membership is found in the Woman's of Concord with 275 members; Nashaway of Nashua, 200; and New Hampshire Audubon Society of Manchester, 300. The departmental study class includes nearly all clubs in the State. The New Jersey State Federation was organized in 1894. There are 96 clubs with a total membership of 10,000. Although the State of New York is exceeded by two other States in the

number of clubs, yet it leads in the total number of women represented, 30,000. The largest clubs are the Alumnae of the Normal College, New York, with 1,750 members, and Kings County Political Equality League of Brooklyn, 1,100. New York's clubs are greatly diversified in character. Alumnae and college associations number 22; clubs devoted to civics, including the Health Protective, 11; child study and mothers' clubs, 6; professional clubs, 7; suffrage and political equality clubs, 6; patriotic, 4; educational and industrial, 9; library, 2; hospital associations, 3; ethical culture, single tax, parliamentary, civil service, diet, kitchen, reform, prevention of cruelty to animals, one club each. There are three Republican clubs. The remainder are the usual departmental and study clubs. Special federative work has been directed toward establishing a State industrial school for girls. The North Dakota State Federation embraces 41 study clubs; total membership 800. The Pioneer Club of Grand Forks is the oldest in the State. The strongest clubs, numerically speaking, in the State of Ohio are Cincinnati Woman's Club, 384 members; Woman's Century, Dayton, 325; Woman's Educational, Toledo, 252; Cleveland Sorosis, 207. Excepting the Cincinnati Educational League, Dayton Kindergarten, and the Faculty Club of the Ohio Wesleyan University, the clubs of the State belong to the departmental study class. They have aided in establishing libraries of which there are nearly 1,000 Traveling Libraries alone, in procuring lectures and pictures for the public schools. Through co-operation they have accomplished the establishment of two State normal schools, as well as many cooking and vacation schools, and playgrounds. The clubs of Oregon are devoted to the interests of education, library, domestic service, legislation, civics. The largest club is the Council of Jewish Women; the oldest, the Thursday Afternoon Club, of Pendleton. In Pennsylvania the largest clubs are the Alumnae Association of Girls' High and Normal Schools, membership 16,000; New Century, 600; Civic Club, 600; all of Philadelphia. The clubs of the federation devoted to literature, libraries, civics, art, domestic science, music, woman's suffrage, education, press, religion and philanthropy, sanitation, free kindergarten, village improvement and study. The Rhode Island State Federation was organized in 1896. It has 17 clubs with a total membership of 1,487. In South Carolina the largest club is the Greenville Alumnae with 443 members. Forty clubs are devoted to such subjects as literature, art, music, history, libraries; four clubs represent kindergarten interests. There is a Civic Club at Charleston. There is one club for child study and one for charity. Among others are the Park Association, Hospital Association, Intercollegiate Club and Alumnae Club. The South Dakota State Federation, organized January 1900, has 30 clubs. The Round Table Club of Deadwood organized the circulating library, that has since become the Deadwood Public Library. Tennessee has 37 clubs, the largest being The Nineteenth Century Club of Memphis with 200 members, and the Ossoli Circle of Knoxville, which has the distinction of being the oldest club south of the Ohio River. The State Federation owns or controls 55 libraries. Texas has 77 clubs, two are devoted to civics and three to kindergartens. There are 70

WOMEN'S CLUBS

Study Clubs, a Public School Art League and a Schubert Choral. The largest clubs are the Woman's Club of San Antonio, and the Woman's Temple. Over \$2,000 has been raised as a loan fund to aid talented young women, whom poverty would otherwise debar, in taking a course at the State University. In Vermont there are 27 clubs. The largest is the Woman's Club of Saint Johnsbury with 216 members.

National Organizations.—The National Clubs are the Daughters of the American Revolution, Daughters of the Revolution, Society of the Colonial Daughters of the 17th Century, and United States Daughters of 1812, organized "To perpetuate among their descendants the memory of those brave and hardy men who assisted in establishing the Colonies of America, and imperilled their lives and interests in the various colonial wars from May 1607, to December, 1699"; "To perpetuate the memory of the spirit of the men and women who achieved American Independence, to commemorate the heroes of the War of 1812, and to foster true patriotism and to aid in securing for mankind all the blessings of liberty." The activities of National Societies include the acquisition and protection of historical spots and the erection of monuments; the encouragement of historical research, the preservation of documents and relics, etc. They also encourage the celebration of patriotic anniversaries, and innumerable fine monuments, bronze tablets, and other memorials, are constantly voicing the patient labor of these tireless descendants of our former heroes and martyrs.

Individual Clubs.—Women's clubs are greatly diversified in their aims. The larger number belong to the social and literary study class, having departments devoted to history, travel, literature, art, music, civics, household economics, current events and kindred subjects. Besides these there are many clubs of the "health protective" class which co-operate with the boards of health of different cities. To this class are allied the village improvement clubs, which are devoted to municipal improvement. There are the purely civic clubs as well, and those of household economics, orders that strive to awaken interest in scientific knowledge of foods, fuel, clothing and sanitation. Societies for the study of child nature, societies of industrial art, art clubs, music clubs, parliamentary clubs,—all belong to the study class. Alumnae associations are formed from the graduates of colleges, institutes, academics and seminaries, "To unite graduates for their mutual benefit, to preserve the pleasant relations formed during college life, and advance the cause of education among women." Kindergarten clubs have furthered that good work. Library clubs have built up free libraries. In the South and West traveling libraries have been established, doing a tremendous work toward free education. Professional clubs include many associations of teachers, nurses, lawyers and women of other professions. Press clubs, for members of the literary profession are in all large cities, and are justly popular. The Professional Woman's League (q.v.) of New York, one of the strongest clubs of this class, was organized in December 1892 for the benefit of members of the dramatic, musical and literary professions. It is a distinctive society in that it loans money to its members when sickness or sudden calamity overtakes them. It earned great commendation by

producing the Woman's Exhibition in 1902. The membership is 500. The Kanatenah of Syracuse, N. Y., is a business club with social features. There are very many clubs of working women all devoted to improvement and the better education of members. To this class belong the educational and industrial unions. The Woman's Christian Temperance Union (q.v.) is a large active body, doing the work its name implies.

The International Sunshine Society, founded by Mrs. Cynthia Westover Alden, 1896, and incorporated 8 March 1900, has for its object: "To incite its members to the performance of kind and helpful deeds, and to thus bring the sunshine of happiness into the greatest possible number of hearts and homes." This is the largest individual club in the country, although it might be classed in the line of federations, as it has branches all over the United States, and a few in other parts of the world. The estimated membership is 250,000.

Negro Women's Clubs.—The National Association of Colored Women was organized in 1894. Its motto is "Lifting as we Climb." It numbers 165 clubs. The Northeastern Federation with 55 clubs, and the Southern Federation numbering 40 clubs, are active members of the national body, the balance being individual clubs. The association meets biennially.

State Federations.—In 1903 a circular letter was sent to the president of every State Federation. In several instances no replies have been received. Therefore failure of representation in this list of Federated clubs is due to the fault of the presidents of the omitted Federations:

STATE FEDERATIONS	Date of organization	Number of clubs	Total number women represented
Arizona	1901	8	250
Arkansas	1897	74	3,159
California	1900	136	9,450
Colorado	1895	108	4,700
Connecticut	1897	51	3,094
Delaware	1898	13	1,100
District of Columbia	1894	12	7,000
Florida	1895	14	500
Georgia	1896	51	5,000
Illinois	1894	244	23,737
Indiana	1900	47	1,499
Iowa	1893	291	10,500
Kansas	1895	110	6,000
Kentucky	1894	46	4,719
Louisiana	1902	18	500
Maine	1892	106	4,223
Maryland	1900	29	2,700
Massachusetts	1894	185	23,000
Michigan	1895	148	10,200
Minnesota	1895	195	8,000
Missouri	1895	114	5,000
Nebraska	1894	108	4,000

Washington	1896	65	1,600
Wisconsin	1896	150	5,500
Total		3,535	228,036

MRS. EDWIN KNOWLES,
Professional Woman's League, New York.

WOMEN'S CLUBS — WOOD

Women's Clubs, General Federation of, an organization incorporated in the United States in 1892, and composed of over 2,675 women's clubs, having a membership of 155,000 women in the United States and foreign countries. The purpose of the federation is declared in its articles of incorporation to be "to bring into communication with one another the various women's clubs throughout the world, that they may compare methods of work and become mutually helpful. Constitutions of clubs applying for membership should show that no sectarianism or political test is required, and, while the distinctively humanitarian movements may be recognized, their chief purpose is not philanthropic nor technical, but social, literary, artistic, or scientific culture." Meetings of the federation are held biennially. There are 37 State federations auxiliary to the General Federation, and 683 single clubs in 41 States. See **WOMEN'S CLUBS**.

Women's Home Missionary Society. See **METHODISM IN AMERICA**.

Women's Rights is the term applied to the claims, made on behalf of women, to a legal, political, educational, and social status equal to that of men. The modern movement in this direction dates from about 1848, having begun in the United States. Notwithstanding the ridicule which assailed its early advocates, the claims of women have been largely recognized in more recent legislation in Great Britain and British colonies, as well as in America. See **WOMEN, LEGAL AND POLITICAL STATUS OF**.

Wonsan, wùn'sân, Korea, a treaty-port on the east coast, on Broughton Bay, 115 miles north by east of Seoul. A gold-mine is worked here. Pop. 15,000.

Woo'-chang', China. See **WU-CHANG**.

Wood, wud, Alexander, Scottish physician: b. Cupar, Fife, 10 Dec. 1817; d. Edinburgh 26 Feb. 1884. He was graduated from Edinburgh University with the degree of M.D. in 1839; and shortly afterward became one of the medical officers at the Royal College Dispensary in Edinburgh. He established a medical practice in that city, and was one of the most prominent members of the Royal College of Physicians and Surgeons there, being president of that organization in 1858-61, and representing it in the general medical college in 1858-74. His most important contribution to the practice of medicine was the introduction of the use of the hypodermic syringe for administering drugs; this he first brought into notice by the publication of a pamphlet in 1855, entitled 'New Method of Treating Neuralgia by the Direct Application of Opiates to the Painful Points.' He was also active in public life, and in the free-church movement, editing the 'Free Church Educational Journal' for some time. In addition to the pamphlet mentioned he wrote 'What is Mesmerism' (1851); 'Smallpox in Scotland' (1860); 'Preliminary Education' (1868).

Wood, Anthony, English antiquary and biographer: b. Oxford 17 Dec. 1632; d. there 29 Nov. 1695. He was educated at Merton College, Oxford, and gave his life mainly to matters connected with the history of the university. His researches resulted in his 'History and Antiquities of the University of Oxford' (1674). It was written in English; but

as it was thought proper that it should appear in Latin for the information of foreigners, it was translated into that language under the inspection of Dr. Fell, and published at the Oxford Press, as 'Historia et Antiquitates Universitatis Oxoniensis.' Wood's 'Survey of the Antiquities of the City of Oxford' was edited by Clark in 1889-99. In 1691-2 appeared his 'Athenæ Oxonienses,' an account in English of the writers and bishops educated at Oxford from 1500 to 1690, but for his criticisms of the Earl of Clarendon in this work he was expelled from Oxford. The English edition of his first work appeared as 'History and Antiquities of the Colleges and Halls in the University of Oxford' (1786-90), and 'History and Antiquities of the University of Oxford' (1792-6). The Oxford Historical Society published an edition of his autobiography and diaries by Clark in 1891-1901.

Wood, De Volson, American engineer: b. Smyrna, N. Y., 1 June 1832; d. Hoboken, N. J., 27 June 1897. He was graduated from the Rensselaer Polytechnic Institute, Troy, N. Y., in 1857, was professor of civil engineering in the University of Michigan, 1857-72, professor of mathematics in the Stevens Institute of Technology at Hoboken, 1872-85, and from the last named date professor of engineering there. Among valuable inventions by him may be mentioned a steam pump, pneumatic rock drill, and an air compressor. He published: 'Resistance of Materials' (1871); 'Bridges and Roofs' (1873); 'Co-ordinate Geometry' (1879); 'Reaction Motors'; etc.

Wood, Edward Stickney, American chemist: b. Cambridge, Mass., 28 April 1846. He was graduated from Harvard in 1867 and obtained his medical degree in 1871. He was assistant professor of chemistry in the Medical School 1871-6, and has been full professor there from 1876. He has published a translation of Neubauer and Vogel's 'Analysis of Urine' (1879); and is an expert on all matters relating to poisons. Since 1873 he has been chemist of the Massachusetts General Hospital.

Wood, Eleazer Derby, American soldier: b. New York 1783; d. Fort Erie, Ont., 13 Sept. 1814. He was graduated from West Point in 1806 and in the second war with England conducted the defense of Fort Meigs in 1813, and was brevetted major for gallantry. He participated in the battle of Niagara or Lundy's Lane, 26 July 1814, and was brevetted lieutenant-colonel for services on this occasion. In the sortie of 13 September he fell at the head of his command. A monument to his memory was erected at West Point.

Wood, Ellen Price, English novelist, best known as Mrs. HENRY WOOD: b. Worcester 17 Jan. 1814; d. London 10 Feb. 1887. In 1836 she married Henry Wood, a member of a banking and shipping firm, and from then till 1856 lived in France. She began her literary career by contributing to 'Bentley's Miscellany' and the 'New Monthly Magazine,' and in the ingenuity of her plots excelled all her English contemporaries. Her books are not sensational in the ordinary acceptance of the term, and display beside remarkable constructive skill, not a little keen character drawing and descriptive power. They have been widely circulated both in this country and England and among them

WOOD

are: 'East Lynne' (1861), which has had an enormous success both as a book and a drama, and still continues as popular as ever; 'Mrs. Halliburton's Troubles' (1862); 'The Channings,' which is a most entertaining study of schoolboy life (1862); 'The Shadow of Ashlydyat' (1863); 'A Life's Secret' (1867); 'Roland Yorke' (1869), a continuation of 'The Channings'; 'Dene Hollow' (1871); 'Within the Maze' (1872); 'Edina' (1876); 'Pomeroy Abbey' (1878); 'Court Netherleigh' (1881); 'The House of Halliwell' (1890); and the 'Johnnie Ludlow Stories' (1874-80). Consult 'Memorials' by her son (1894).

Wood, Sir Evelyn, English general: b. Cressing, Essex, 9 Feb. 1838. He was educated at Marlborough College and joined the navy in 1852. During the Crimean war he served in the Naval Brigade, and was severely wounded while carrying a scaling ladder to the redan. In 1855 he entered the army as cornet, in 1858 served in India as a brigade-major and gained the Victoria Cross for conspicuous valor, in 1860. In 1873 he served in the Ashantee war, and on his return from this campaign was called to the bar at the Middle Temple (1874). He served in the Zulu war of 1879 and was promoted to the rank of brigadier-general after his victory at Kambula. He was second in command of the British forces in the brief Transvaal war of 1881, and in 1882 went to Egypt as commander-in-chief or sirdar. In 1893 he became quartermaster-general to the forces, and held that position till his appointment in 1897 to the office of adjutant-general to the forces. He has published: 'The Crimea in 1854' (1894); 'Cavalry at Waterloo' (1896); 'Cavalry Achievements.' Consult 'Life' by Williams (1892).

Wood, Fernando, American politician: b. Philadelphia 14 June 1812; d. Washington, D. C., 14 Feb. 1881. In 1820 he removed to New York, where he was educated, and entered business as a shipping merchant. He early became identified with political organizations, and was active as campaign writer and orator. He was elected to Congress in 1840 on the Democratic ticket, serving one term. In 1850 he retired from business and in that year was the Tammany candidate for mayor of New York, but was defeated. As candidate of the same organization in 1854 he was elected mayor of New York; introduced various reforms and was re-elected in 1856 almost without opposition. Discussion in the organization led him and his followers to form a rival body called Mozart Hall. He was the unsuccessful candidate for mayor of this organization in 1858, but in 1860 was a third time elected mayor in opposition to both Republican and Tammany candidates. In 1861, when secession was under discussion, he recommended that New York should secede and become an independent city. He was elected to Congress in 1863 and 1867.

Wood, George, American author: b. Newburyport, Mass., 1799; d. Saratoga, N. Y., 24 Aug. 1870. He was clerk in the War Department (1819-22), and afterward chief of a division in the United States Treasury Department. He published: 'Peter Schlemihl in America' (1848); 'The Modern Pilgrim' (1855); 'Marrying Too Late' (1856); 'Future Life' (1858), republished as 'The Gate Wide Open.'

Wood, George Bacon, American physician: b. Greenwich, N. J., 13 March 1797; d. Philadelphia, Pa., 30 March 1879. He was graduated from the University of Pennsylvania in 1815 and from its medical department in 1818, and was professor of chemistry at the Philadelphia College of Pharmacy 1822-31, and of materia medica there 1831-5. He held the chair of materia medica at the University of Pennsylvania 1835-50, and of the theory and practice of medicine there 1850-60, endowing an auxiliary faculty of medicine in the university in 1865. He published 'Treatise on the Practice of Medicine' (1847); 'Therapeutics and Pharmacology' (1856); and with Franklin Bache prepared 'The Dispensary of the United States' (1833, 17th ed. 1894).

Wood, Henry, American author: b. Barre, Vt., 16 Jan. 1834. He was graduated from a commercial college in Boston in 1854 and has published: 'Natural Law in the Business World' (1887); 'Edward Burton,' a novel (1890); 'God's Image in Man' (1892); 'Ideal Suggestions' (1893); 'The Political Economy of Humanism' (1901); 'The Symphony of Life' (1901); etc.

Wood, Mrs. Henry. See **WOOD, ELLEN PRICE.**

Wood, Horatio Curtis, American physician: b. Philadelphia, Pa., 13 Jan. 1841. He was graduated in medicine from the University of Pennsylvania in 1862, and was professor of medical botany there 1866-76, and clerical professor of diseases of the nervous system since the last named date. In addition to many professional papers he is the author of 'Thermic Fever' (1872); 'Physiological Therapeutics' (1874, 9th ed. 1894); 'A Study of Fever' (1875); 'Nervous Diseases and their Diagnosis' (1881); 'Syphilis of the Nervous System' (1889).

Wood, James Frederick, American Roman Catholic prelate: b. Philadelphia, Pa., 27 April 1813; d. there 20 June 1883. He was educated in England and on returning to the United States entered the banking business. In 1836 he went to Rome to study for the priesthood and after his ordination in 1844 became an assistant rector of the cathedral at Cincinnati, and afterward pastor of St. Patrick's Church. In 1857 he became bishop of Philadelphia, where he completed the magnificent cathedral in Logan Square. He also established at Overbrook the Seminary of St. Charles Borromeo. He was created archbishop in 1875. He was especially opposed to the introduction of political issues from other countries to the United States.

Wood, John George, English naturalist and Anglican clergyman: b. London 21 July 1827; d. Coventry, Warwickshire, 3 March 1889. He was graduated from Merton College, Oxford, in 1848, and took orders in the English Church. In 1856-62 he was chaplain to St. Bartholomew's Hospital, in 1858-63 a reader at Christ Church, Newgate Street, and for seven years from 1869 conducted the festivals of the Canterbury Diocesan Choral Union. During 1870-88 he delivered numerous lectures on natural history in Great Britain and America. His numerous works contributed very greatly to popularize natural history. Among them are: 'The Illustrated Natural History' (1851); 'Bees' (1853); 'Common Objects of the Sea-

WOOD

Shore' (1857); 'Common Objects of the Country' (1858); 'Routledge's Illustrated Natural History' (1859-63), his most important work; 'Common Objects of the Microscope' (1861); 'Our Garden Friends and Foes' (1863); 'Homes Without Hands' (1864-5); 'Common Shells of the Sea-Shore' (1865); 'Fresh and Salt Water Aquarium' (1868); 'Natural History of Man' (1868-70); 'Bible Animals' (1869-71); 'Insects at Home' (1871-2); 'Insects Abroad' (1874); 'Man and Beast: Here and Hereafter' (1874); 'Field Naturalist's Handbook' (1879-80); 'Half-Hours in Field and Forest' (1884); 'Half-Hours with a Naturalist' (1885); 'Romance of Animal Life' (1887). Consult 'Life' by his son (1890).

Wood, John Seymour, American lawyer: b. Attica, N. Y., 1 Oct. 1853. He was graduated at Yale in 1874 and at Columbia Law School. He was editor of the 'Bachelor of Arts Magazine' (1866-8), and has published: 'Gramercy Park: A Story of New York' (1892); 'A Daughter of Venice' (1892); 'College Days' (1895); 'A Coin of Vantage' (1896); 'Yale Yarns' (1897); 'An Old Beau, and Other Stories'; etc.

Wood, Leonard, American soldier and administrator: b. Winchester, N. H., 9 Oct. 1860. He was graduated at the Harvard Medical School in 1884, and in 1885 became a contract-surgeon in the United States army. In 1886, as first lieutenant and assistant surgeon, he served in the campaign against Geronimo. When the war with Spain began, in 1898, with Theodore Roosevelt, he organized the "Rough Riders," and was made colonel of the regiment, which he commanded at Las Guasimas. At the battle of San Juan Hill he led a brigade; was commissioned a brigadier-general of volunteers 8 July 1898; promoted major-general 8 December; and on 4 Feb. 1901 was made brigadier-general in the regular army. In July 1898, after the surrender of Santiago, he was placed in command of the city, and was military governor of Santiago until December 1899, when he succeeded Gen. Brooke as military governor of Cuba, and continued in that position until the withdrawal of the United States from the island in May 1902. In 1903 he was assigned to the command of a division of the army in the Philippines and made military commander and civil governor of the Sulu Archipelago. In the same year he was nominated for a major-generalship in the regular army. When he took charge in Santiago sanitary and social conditions throughout the province were bad beyond description, yellow fever and other infectious diseases being prevalent, food scarce, and demoralization general. By his vigorous administration he soon brought about marvellous improvement. Infectious material was destroyed, cleanliness secured, drainage and water supply provided, yellow fever quickly and, as is believed, permanently banished, the death-rate greatly lowered, order and efficient government established, and public schools introduced. When Gen. Wood ended his work in Cuba the schools numbered nearly 4,000, with as many teachers (mostly native), an enrolment of over 250,000, and a daily attendance of 140,000; and the reforms accomplished in Santiago had been extended to Havana and to other parts of the island. The laws were revised, the judiciary reorganized,

charities and corrections better administered, public works remodeled, police discipline secured, and fit election laws and methods adopted. The government of Gen. Wood was military only in name, and his sanitary, civil, and social reforms prepared the Cuban people for the orderly self-government which the island now enjoys.

After the nomination of Wood for major-general in the regular army a storm of protest was raised in the public press of the United States, mainly on the ground of his alleged want of military training and experience and that the promotion was made over the heads of veteran officers and through personal and political influence. Grave charges were also made against his conduct in Cuba, and when the question of his confirmation as major-general came before the Senate these were investigated by that body, and his nomination was finally confirmed. During the time of his service in the Philippines Gen. Wood has been called upon to suppress several outbreaks among the natives under his authority. Consult: 'Cuba: Civil Report of Gen. Wood' (1901); his article, 'The Military Government of Cuba,' in 'Annals of the American Academy of Political and Social Science,' Vol. XXI, No. 2 (1903); Baker, 'Gen. Leonard Wood,' in 'McClure's Magazine,' Vol. XIV., pp. 368-379 (1900); and 'The Outlook,' 2 Jan. 1904, 'The Case of Gen. Wood.'

Wood, Thomas John, American soldier: b. Munfordville, Ky., 25 Sept. 1823. He was graduated from West Point in 1845, served under Gen. Taylor in the Mexican War, and was on frontier duty in Texas 1849-55. At the outbreak of the Civil War he was promoted lieutenant-colonel in the Federal army, and in the following October was made a brigadier-general of volunteers. He commanded a division at Shiloh and Corinth and also at Chickamauga and Missionary Ridge, and for gallantry at the latter engagement was brevetted brigadier-general. He commanded the Fourth corps at Nashville and for his services there was brevetted major-general in 1865. In June 1868 he was retired from the service.

Wood, Thomas Waterman, American artist: b. Montpelier, Vt., 12 Nov. 1823; d. New York 1902. He studied art in Boston in 1848, afterward continuing his studies in Europe. In Dusseldorf he was the pupil of Hans Gude. He was well known as a portrait painter and for several years traveled about the country in this capacity, finally settling in New York in 1866. After removing to New York Mr. Wood devoted himself almost entirely to genre painting, in which he chose familiar subjects in American life. He became a member of the National Academy in 1871, and from 1878-87 was president of the American Water Color Society. He was president of the National Academy of Design from 1891 to 1899. He also was one of the founders of the New York Etching Club, and was a regular contributor to its exhibitions, most of his etching being after his own paintings. Three of Mr. Wood's paintings, 'The Contraband,' 'Recruit,' and 'Veteran,' exhibited at the Academy of Design in 1867, now are among the pictures at the Metropolitan Museum of Art. Many of his portraits are in the Chamber of Commerce col-

WOOD

Iection. During the last decade Mr. Wood visited Europe three times, copying the best masters in London, Paris, Saint Petersburg, and Cassel, giving especial attention to Rembrandt and Murillo. With these copies and with original works of his own he founded the Wood Art Museum in his native town.

Wood, Walter, English author: b. Bradford, Yorkshire, 10 March 1866. He was for 10 years attached to the staff of the *Yorkshire Daily Observer* and has published 'Barrack and Battlefield' (1897); 'Famous British Warships and Their Commanders' (1897); 'With the Flag at Sea' (1901); 'Wellington's Dispatches' (1902); etc.

Wood, Walter Abbot, American inventor: b. Mason, N. H., 23 Oct. 1815; d. Hoosick Falls, N. Y., 15 Jan. 1892. Having early given his attention to the improvement of farming implements, he in 1850 introduced the Mauny harvesting machine with original improvements. He continued to improve mowers and reapers and in 1884 disposed of 48,300 machines. His inventions were covered by about 30 patents, and he was awarded first prizes at the World's Fair in Paris in 1867, in Vienna in 1873, in Philadelphia in 1876, and in Paris in 1878.

Wood, William, English colonist in America: b. about 1580; d. Sandwich, Mass., 1639. He came to America in 1629, returned to England in 1633, but not long after again sailed for Massachusetts, where he settled first at Lynn, which he represented in the General Court in 1636, and afterward (1637) at Sandwich, of which he became town-clerk. In 1634 he published in London 'New England's Prospect,' the first printed account of Massachusetts. The perfect copies extant contain a map of the region. The prose narrative is interspersed with rined descriptions of natural history. This curious work was reprinted in 1764 (Boston) and 1865 (also Boston; Prince Society).

Wood-Allen, Mary, American physician: b. Delta, Ohio, 19 Oct. 1841. She was graduated at the Ohio Wesleyan University in 1861, and at the Medical Department of the University of Michigan in 1875, and was married to C. B. Allen in 1863. She practised medicine for a time in Newark, N. J., and later removed to Ann Arbor, Mich. She has published: 'Man Wonderful in House Beautiful' (1883); 'Teaching Truth' (1892); 'Child Confidence Rewarded' (1893); 'Marvels of Our Bodily Dwellings' (1896); 'Almost a Man' (1896); 'Almost a Woman' (1897); 'Baby's Firsts' (1898); 'What a Young Woman Ought to Know' (1898); 'What a Young Girl Ought to Know' (1897); etc.

Wood. Wood is a more or less compact tissue which constitutes the part of the trunks, branches and roots of arborescent vegetable growth, lying between the bark and the soft sapwood next the bark, and the pith at the centre. The word "wood" is derived from the Anglo-Saxon *weidu*, a tree. The outer layers, or sapwood, are called the alburnum. The inner solid wood is called the duramen. Timber is wood large enough for architectural uses, such as boards, planks, beams. The term hardwood is applied to such woods as mahogany and oak where the cells have thick walls and are closely packed together. Soft wood has large cells and

thin cell walls, such as white pine, cedar, poplar. It would seem in this century that wood is losing its importance as a material of construction. For framing, iron and steel seem to have dethroned wood; and even in furniture, iron has taken the place of wood in certain parts. Everything is iron or steel: a series of metal beams covered with plaster hidden from the eyes of the prying public as well as sheltered from fire; above this a good bed of plaster or poor, cementless, concrete; the builder "rests easy," the effect is good and satisfying, so we build iron floors. After a while, we invent new forms of framework. We cover the I-beams from which the floor arches spring, with terra cotta or plaster, leaving the large beams to show under the ceilings, wood seems to be banished. Iron is even supplanting the lath and plaster partitions, and expanded metal or wire-screen lath with channel or angle-iron stiffeners are used even in inexpensive construction. The wooden stagings and centerings with which the stone and iron structures are erected are almost as interesting as the structures themselves. Wood is elastic, comes back into place, and is easily worked. Wood is not imperishable, neither is iron. One reason

FIG. 1.

why wood is being used so little in construction is because it is not employed in a natural way: instead of leaving it natural, it is covered with plaster; often wood is used green when it should be seasoned. A practical way of getting at the quality of wood is to find its price in the market. For example, oak which would sell at \$110 per M. would be good enough for the best floor, while oak for furniture would be sold for half as much more.

The principal countries where wood has been generally used as building material are Switzerland, Norway and Japan. The chalets of Switzerland with their big overhanging roofs and flat balustrades with jig-sawed patterns, are well known. The wooden construction of Norway and Sweden has some resemblance to these. The Japanese wooden houses and temples are unique and show their artistic development. Vitruvius describes the woodwork of ancient Rome, but nearly all traces of it have disappeared. Cæsar's bridge is well known to all students. The huge concrete and stone buildings of the Roman empire were built on wooden centering, which was as carefully constructed as if it were to be permanent itself. The half-timber work of the Middle Ages where the framing was made of heavy timbers was filled in between with plaster, making a very solid permanent construction. The ceilings of the churches of the Middle Ages were frequently worked out in timber and many of the Gothic churches had timber roofs, which followed out the feeling of the Gothic style. The shingle architecture of

the modern American country house, the old colonial buildings and the still earlier log cabins are good examples of what can be done with wood construction. The defects of timber are caused by splitting, knots, rot, sap-wood, warping. Timber should have a straight grain, should be well seasoned, and if not weather-seasoned, should be kiln-dried.

The development of the modern system of wood framing resembles strikingly the still more recent American methods of steel construction, as both are a veneer on a simple framework. Neither the country house nor the office building expresses its constructive features on the exterior. This, of course, has an economic cause: it is much easier to start the rough carpentry with the sill when the mason has completed his wall, and carry out all the rough framing and boarding with the knowledge that none will show as finished work; all the effort will tend to rapidity and strength. The exterior is then covered with shingles or clapboards, and the interior with lathing and plastering, leaving a finished plaster surface. Then follows the "joiner" or carpenter for the finished interior work, which is put in after the plastering is dry, and therefore is entirely separate in time and character from the rough framing.

Defects in Timber.—It is very important to

FIG. 2.

remove the sap-wood with care, for it constitutes a soft, spongy mass, containing fermentable sap, and allowing dampness to penetrate very easily; rot develops, and worms appear, and from the sap-wood, go through the whole substance. Lumber is piled or "stuck" after it is sawed with small sticks of wood between the pieces to allow a circulation of air, and allowed to remain for several months. For interior finish, the wood is generally seasoned, by artificial means, that is, "kiln-dried." The pieces are put in a room heated by steam to a temperature of about 150° F. and allowed to remain for several days or weeks until thoroughly dry.

Preservation of Timber.—Up to the present time, the greatest attention has been given to the preservation of railroad ties. The principal processes are those where either creosote or zinc chloride is used. Sometimes a combination is used. All French and English ties use the creosote process which gives them a life of 20 to 25 years. A recommended combination is 38 per cent dead oil of coal tar, 60 per cent resin melted, 2 per cent formaldehyde. Inject this after raising timber to 250° F.

Quarter-sawing.—This term is applied to a log cut lengthwise into quarters, so that the quarters can be cut into boards parallel to the radius 45 degrees between these cuts. These sections are so nearly in the plane of the medullary rays that they show the best grain, especially in oak, and boards cut in this way are less likely to warp and show little shrinkage. Often

the grain of wood which renders it weak will give a good effect for paneling or veneering. In Fig. 1, plank A is quarter-sawed and will lie flat and will not splinter; plank B is poorly cut, being taken from one side of the log, as in Fig. 2 A. If the first board were taken directly through the centre of the log and the others parallel or perpendicular to it the grain would lie nearly parallel with the medullary rays as shown at B (Fig. 2). In Fig. 1, plank B is poorly laid, and would stand much better if laid with the heart or hollow side down as at Fig. 1, C.

Framing.—From the period of the first settlement of America, the cheapness of wood has made it the popular building material. The log-cabin was built of the logs cut when the early settlers cleared the land. Two sides were adzed off and the ends of the logs were notched so as to fit closely at the corners. The cracks were filled in with mud and the roof framed with small roughly worked rafters which were covered with split shingles. The advent of the saw-mill soon brought into use "dimension" lumber, rectangular in section, to be set so that its broadest side should take the strain. For example, 2-inch by 8-inch floorings 12 inches or 16 inches apart and strongly braced or "bridged" by small pieces nailed in between, took the place of 10-inch by 10-inch timbers which spanned the same space at greater intervals but necessitated the use of much more timber on account of their own size and also because of the larger amount of timber necessary for filling in between. This evolution has brought us to two methods of wood construction, the "full frame" and "balloon framing," the latter being used for small buildings, such as ordinary dwelling-houses, only.

Northern Pine (rare) (*Pinus sylvestris*) is also called Norway pine and Scotch fir, and is known in Great Britain as red or yellow deal. It is found in the northern parts of Europe, especially in Scandinavia on the mountains where there are large forests of these trees. Its color is warm with reddish tones. When first cut it is very resinous. It is one of the most useful pine woods and is strong, durable and easily worked. Its timber, which is used in both civil and naval architecture, is exported from Norway, Sweden, Prussia and Russia.

Canada Red Pine (*Pinus resinosa*).—This wood is sometimes called Norway pine. It takes the name of red pine from the color of its bark. The trees are found throughout Canada, but the best red pine is found in the northern parts of Wisconsin and Minnesota. The trees are sometimes 140 feet high. Its wood is tough, and has but few knots. It is used in construction of all kinds, flooring, piling, etc.

White Pine (*Pinus strobus*).—Also called Weymouth pine after Lord Weymouth, who planted it first in England in 1708. The trees are found in large forests in Canada and in the Great Lakes region. The wood is soft and easily worked, of a straight grain, of a light straw color and has but few knots. The tree is tall and effective, reaching sometimes 200 feet in height. It was formerly the most extensively used soft wood in America.

Yellow Pine (*Pinus mitis*) is also called short-leaved pine to distinguish it from the long-leaved Georgia pine. It is a native of the western and Southern States. West of the Mississippi its hard fine grain of wood is made into timber,

RADICAL SECTIONS OF TYPICAL WOODS.

1. Yellow Willow. 2. Black Walnut. 3. White Cedar. 4. Sycamore. 5. White Oak. 6. Redwood. 7. Tulip Tree, or Whitewood. 8. Black Ash. 9. White Spruce. 10. White Pine. 11. American Elm. 12. American Holly. 13. Wild Black Cherry. 14. White, or Canoe Birch. 15. Live Oak. 16. Silver Maple. 17. Shellbark Hickory. 18. American Beech.

WOOD ALCOHOL—WOOD-BORING BEETLES

but the timber is not so large as that of the Georgia pine.

Georgia Pine (*Pinus palustris*), known as the long-leaved or Georgia pine and as the turpentine tree. Its wood is coarse and owing to its having so much resin it is extremely difficult to work. The wood is used for coarse lumber, ship-building, heavy timber, and for obtaining tar, pitch, and turpentine.

Norway Spruce (*Picea excelsa*) is a tree which attains great height, often growing as high as 150 feet, and is a native of the northern parts of Europe and Asia. Its branches grow quite near to the ground as do all firs. This wood has many hard knots, which makes it very difficult to cut. It is used nevertheless for masts, spars, boards, etc. Large quantities are shipped from Russian ports and some of the best stock comes from Christiania.

American Spruce (*Picea nigra*), or black spruce, much resembles the Norway spruce except that its color is grayer and colder. It grows from 50 to 70 feet in height and is found in British America and northern parts of the United States. Its wood is light and strong and is much used in ship-building, and general rough framing.

Cedar, an evergreen tree of the coniferous genus. Its wood is soft and of a reddish brown color and sometimes has a very fragrant odor. It is used for chests and cigar boxes. There are three known species of cedar. The cedar of Lebanon is noted, of which there still remains a grove of some 400 trees.

Basswood (*Tilia americana*).—This wood is the American Linden or lime tree; it is also called bass. It is a yellow ochre in color and straight-grained. It does not wear very well but stains and polishes easily.

American White-wood (*Liriodendron tulipifera*) is the whitish timber of the tulip tree, the wild cinnamon, basswood and Guiana plum trees. It grows in the Middle States. Its wood is of a pinkish gray color, very soft and of a smooth surface. It is used largely for sheathing. It is exported from New York and Philadelphia.

Birch American (*Betula lutea*), called also yellow birch. This wood has a smooth outer bark, close grain, moderately hard wood and is used for making furniture, for fuel and other purposes. The oil from its bark is used to give Russia leather its odor.

Ebony (*Diospyros ebenaceæ*) is the name given to a wood of a very dark color. It is very hard and heavy and often jet black and sinks if put into water. It takes a fine polish and is much used for high class cabinets, toilet sets, inlaying, making flutes, etc. It is a native of the flat parts of Ceylon. Its usual color is black, but the variety in Jamaica is green.

Beech (*Fagus*) is a large straight tree with beautiful thick foliage. Its height is from 50 to 70 feet. The bark has a smooth, hard surface and blue gray in color. Beech is not much used for building work, for it is not durable except when very wet or very dry. It warps but little and its hardness makes it well fitted for making a great variety of tools and for cabinet work.

Oregon Pine (*Pseudotsuga taxifolia*), known also as Oregon fir, Nootka fir and Douglas pine. Large forests of these trees grow in the western part of the United States and Alaska.

The following are different kinds of lumber which are used for different purposes:

Piles.—Oak, elm, beech, spruce. Posts set in the ground, hemlock, acacia.

Strong Construction.—Oak, teak, yellow or Georgia pine. Available in damp situations, oak, beech, elm, acacia, alder, chestnut. For large timbers, Oregon pine, Georgia pine, oak, bay mahogany, chestnut.

Floors.—Oak, maple, birch, beech, and rift Georgia pine are the best floors for hard wear; North Carolina pine for cheaper floors, and spruce floors where they are to be covered or painted. Oak, hard pine, teak will wear the longest.

Interior Finish and Panels.—Cypress, North Carolina pine, oak, mahogany, sycamore.

Window Sills.—Oak, white pine, mahogany.

Stair Treads.—Oak, hard pine, teak. For school interior finish, ash, hard pine, North Carolina pine.

Wood-boring Beetles, beetles which lay their eggs in or upon wood, into which the larvæ begin to bore immediately after hatching, and from which they derive their sole sustenance. Living upon this innutritious substance their growth is generally slow, and by the end of the several years spent in the larval condition they have often excavated extensive galleries which increase in diameter as the larvæ grow. The larvæ of many beetles feed upon dead or decaying wood only, and many of these may be considered useful to man, as they assist in reducing stumps and fallen limbs to a condition of vegetable mold. Others confine their attacks to the bark, and are seldom serious pests. Many species bore into sound wood either in the standing growing tree, in the dressed lumber, or even in the finished house or article of furniture. Such often commit incalculable damage. The families *Cerambycidae* and *Buprestidae* are notorious as comprising species almost exclusively of wood-boring habits, and those whose larvæ do not excavate wood burrow into roots or soft plant tissues. The *Cerambycidae* (q.v.), or longicorn beetles, include one of our largest beetles, the broad-necked prionus (*Prionus laticollis*), which

WOOD CARVING

reaches a length of nearly two inches and is unusually robust for the family; it is of a deep brown-black color, and the jaws are exceedingly stout. The great white larvæ are two or three inches long and bore into the roots of forest and orchard trees and blackberry plants. The latter are quickly killed and even large trees will succumb if the borers are abundant. They live three years. The apple-tree borer (*Saperda candida*) in the beetle state is brown with a conspicuous white stripe running the entire length of the body on each side above. It flies mostly at night during the early summer months and lays its eggs on the trunks of apple, quince and pear trees near the ground. The larva is cylindrical and very strongly annulated and when fully grown is an inch long. It lives three years, the first one being spent in the sap-wood, the others in the interior of the trunk. Its attacks are frequently fatal and the only effective measures are preventives. A strip of tin or wire gauze nailed to the tree trunk from the ground to a height of two feet will prevent most of the females from depositing their eggs. Another exceedingly serious pest is the locust-tree borer (*Cylleus robinia*) which has habits similar to the last and which often riddles the trunks of locust-trees with its burrows, killing them in a few years. The beetles are very pretty, being dark velvety brown, with angulated cross-lines of yellow. They abound during the early autumn and feed upon the pollen of the goldenrods. Numerous closely related species attack other hardwood trees. A peculiar habit is possessed by the twig-girdler (*Oncidiscus cingulatus*) which in order to provide its larvæ with the dead wood upon which they feed cuts a deep circular trench around the twigs of hickory and other forest trees below the point at which its eggs have been deposited. The twig dies, falls to the ground, and the larva completes its span of life in security.

The species of *Buprestida* (q.v.) differ greatly in appearance from the longicorns; but have similar habits. The larvæ are distinguishable by the greatly expanded prothoracic ring immediately following the head, which is very small and retractile. They are always footless. Although the buprestids nearly equal the longicorns in number of species, and exceed them in variety of forms those in our fauna are smaller and because of their plainer colors, much less conspicuous. Many of the tropical species, however, are of great size and brilliant colors, and some of their larvæ, which may exceed four inches in length, are eaten. A species very injurious to pear orchards is the sinuate borer (*Agrilus sinuatus*) whose extensive winding galleries in the cambium layer often almost completely sever the bark from the wood and kill the tree. The beetle is about half an inch long and both it and the larvæ are slender. Blackberry canes are often infested by another species (*Agrilus ruficollis*), the larvæ of which excavate irregular passages and cause the formation of gall-like enlargements. The species of *Chrysobothris* form excavations beneath the bark and in the sap-wood of various forest trees, and one species (*C. femorata*) is an orchard pest and another (*C. harrisii*) injures the white pine.

The true bark-borers mostly belong to a family, the *Scolytidae*, closely related to the weevils (q.v.). They form most elaborate bur-

rows on the inner-surface of the bark, consisting of numerous galleries radiating in all directions from a central chamber. (See BARK-BEETLES.)

In combating wood-boring beetles the method must be suited to the habits of the particular species, but in general all infected wood should be burned or the larvæ picked out and destroyed. Egg laying should be prevented as far as possible by painting the tree trunks with soap-suds, kerosene emulsion, or similar repellent. Woodpeckers perform a valuable service in the destruction of these larvæ.

Wood Carving, sculpture in wood, either in low relief or in the round. On the whole the grain and structure of wood make it more suitable for carving in relief than for large statues; some woods without much distinct grain can be carved almost as marble or stone; in other woods the artist must carefully adapt his design to the grain of the wood. Wood used for carving must be carefully seasoned and specially prepared; one method of seasoning it is to soak it, when newly cut, in running water, thus washing away all the sap, and then to dry out the water; an ancient method was to smoke it with wood smoke; still another method is to dry the wood in hot rooms, after pieces of paper have been glued on the ends to prevent the sap from drying out at the ends too rapidly. The woods most commonly used for carving are oak, chestnut, walnut; cedar in ancient times; sandalwood and other perfumed woods in the East; pine, fir, and similar soft woods; the last mentioned being especially fitted for carving on a large scale.

History.—Wood carving has occupied an important place in the early development of the fine arts in most nations; though it was almost unknown in Babylonia, Assyria, and Persia, it was common in Egypt in early times, in India, in China, and in Japan; and is now practised by many savage and semi-savage races. Particularly the Maori and Polynesian races use an abundance of wood carving, not only on the walls and beams of their dwellings, but also on their paddles, weapons, etc. Their representations of beasts and men are usually grotesque, but they also carve complicated geometrical figures, spirals, etc., of real beauty and freedom of design. The oldest example of wood carving which is now preserved is Egyptian, a life-size statue of a man known as the Sheikh-el-Beled, dating from 4000 B.C., which gives evidence of marked technical skill; several other smaller pieces of Egyptian carving are also preserved. No specimens of Greek and Roman wood carving have been preserved, but the classical writers leave no doubt that wood was used in the early days of art in both Greece and Rome, and many of the sacred statues were undoubtedly of this material. Wood carving reached its highest development in the Middle Ages. The best early specimens of mediæval carving are found in the Scandinavian countries, on several church doorways, dating from the 9th to the 13th centuries; these are carved on pine, and

WOOD DUCK—WOOD ENGRAVING

the designs consist mostly of interlacing scroll work, combined with figures. The art reached its highest point in France, Germany, England, and Italy in the 14th and 15th centuries. The best examples are found in the furnishing of churches, the pulpits, choir stalls, altar screens, etc. The most careful attention to detail, and artistic combination of figures, leaf and scroll work, combined with dignity of design, mark the best mediæval wood carving. Wood was used for the images of saints, and for effigies on tombs; and also for larger pieces of carving, such as roofs of churches and other edifices, often richly decorated with figures or foliage designs. In the Renaissance period wood carving was lavishly used in church decoration, choir stalls, confessionals, desks, and pulpits; in Italy ceilings were also elaborately carved; but the designs though elaborate and skilfully worked out, began to lose the dignity of the mediæval carvings, and to indicate a low ebb of taste. In modern times the art of wood carving has lost entirely its former importance. It is best developed among the Swiss peasants, where it is a regularly organized business; and is to some extent preserved among workmen in the provincial towns of France. In Switzerland it is used mostly for clocks, small articles of furniture, toilet articles, etc. In England and the United States wood carving has recently been revived to some extent as a valuable part of art training or of general manual training.

Consult: Jack, 'Wood Carving, Design and Workmanship' (1903); Williams, 'History of the Art of Sculpture in Wood' (1835).

Wood Duck, or Summer Duck, the most beautiful of American ducks (*Aix sponsa*). The bill is very high at the base, shorter than the head; nail very large and much hooked; head crested; tail short, wedge-shaped. The head and crest are metallic green, glossed on the sides with purple; line through the eye; two bars on side of head meeting under the chin, and upper throat, white; lower neck and sides of tail purple, the former with triangular spots of white; lower parts white; sides yellowish banded with black and posteriorly with white; speculum bluish green, tipped with white; primaries silver white externally at tip; back uniform, with bronzed and green reflections; a white crescent in front of wings bordered with black; scapulae and inner tertials velvet black with violet gloss. In the female the back is more purplish, the sides of head and neck ashy, about the bill white, and lower neck brownish; the eyes are red. It is 19 inches long, and 29 in alar extent. In most parts the plumage is iridescent with changing metallic reflections.

Formerly the wood duck, one of the most characteristic birds of our fauna, was abundant and widely distributed through the wooded and watered portions of the United States and southern Canada, but as a result of an unholy warfare it has become practically extinct over large areas. It is confined to fresh water, especially secluded ponds in woods. The flight is noiseless, very rapid, graceful, and as easy among the branches of trees as that of the wild pigeon. It breeds from April to June, according to latitude, the nest being made in the hollow of a tree, or in the deserted excavations of the woodpecker or squirrel, and usually in deep swamps, though often in the vicinity of houses, for they are not shy birds. The eggs are 6 to

15, 2 by 1½ inches, pale buff and greenish, smooth, and laid on dried plants and feathers. They are much attached to the breeding places. The young leap down, or are conveyed to the ground or water by their parents. The adults are excellent divers, and feed on acorns, nuts, grapes, berries, rice, insects, snails, tadpoles, and small fry. The chief enemies of the adults are minks, raccoons, and snakes, and many of the young are destroyed by snapping turtles, alligators, and predaceous fishes. It is easily domesticated and readily breeds in captivity. The only other species of the genus is the famous mandarin duck (q.v.) of China.

Consult Grinnell, 'American Duck Shooting' (New York 1902).

Wood Engraving. Wood engraving is especially distinguished from other methods of engraving in being a relief process. In the early days of the art the design was drawn on the block in simple outline and the work of the engraver was to cut away the rest of the wood, leaving the lines of the drawing in relief, which when inked could be made to give an impression in facsimile if a piece of paper were put over

St. Christopher, the earliest wood engraving—size of original 1½ x 8½. Date 1423.

the block and pressure applied to the back. In its modern practice which involves reproduction by tones or tints, the varying values of an original are obtained by the most delicate cutting of lines and dots and minute picks. Blacks are obtained by leaving the wood untouched, pure whites by cutting the wood entirely away. Before the discovery of a method by which drawings could be photographed directly on the wood the design had to be drawn in reverse on the block and the same size as the finished print. By the use of photography the drawing can be

WOOD ENGRAVING

made any size and the reduction made in transferring to the block.

If to the art of printing we owe an inestimable debt for bringing to us the record of the thought and history of all times, to the kindred and older art of the wood engraver we owe almost equal obligations. It gave to the common people the pictures by which they could be made to understand the purport of written and printed words. When and where the art of wood engraving was first invented and by whom

The Grief of Hannah, from the Cologne Bible, about 1475.

has long been a much discussed question. The earliest known examples date from the early part of the 15th century when in various parts of northern Europe, notably in Germany and the Netherlands, there existed various rude prints representing scenes from Scripture and the lives of the saints, evidently made from wood cuts. They were printed in a brown ink apparently by rubbing on the back of the paper with some blunt edged instrument and were often colored either by hand or with the use of a stencil.

One of the most famous of these, and the earliest dated print from a wood block is the famous Saint Christopher of 1423 found pasted in the cover of a manuscript discovered in the library of a convent in Swabia. It represents Saint Christopher wading across a stream with the infant Jesus on his shoulder. On the right bank a hermit is kneeling before his cell holding a lantern in his hand, on the left a peasant is climbing a steep hill on the way to his home. It is a rude cut without any regard for perspective, but the figure of Saint Christopher possesses a certain dignity, and the pictorial effect is such as would appeal to a primitive people. Many similar cuts were produced in the 15th and 16th centuries in the cities of Augsburg, Nuremberg, Ulm, Cologne and the Flemish cities. Conventional in design and often repeating again and again the same subjects, they were yet expressive of the mediæval religious conceptions and were no doubt highly effective in giving particular and comprehensible value to the biblical lessons they were intended to convey.

It has been contended by some authorities that wood engraving really began with the invention of playing cards, but no authentic records are available of their having been printed before 1423, the date of the Saint Christopher, and they appear to have been made with a stencil. The making of sacred prints very soon developed into a large business, and by the middle of the 15th century wood engraving was an established and widely familiar art. Coming before the in-

vention of printing, when books in manuscript only were the treasured possessions of the great monasteries, these prints were of inestimable value in the cause of popular religious education. From the very first wood engraving has been an art for the people. In the beginning serving religious purposes only it soon became a means of satire and comment upon the abuses of the clergy and a record of the manners and customs of the times.

In the early part of the 15th century many minds were striving toward the invention of a way to print from movable types. The idea came no doubt from the so-called block books. Many of the early prints bore the name of a saint or a short legend which was evidently cut on the block with the picture. From these legends it was a natural step to extend the text and add whole columns of type. The date and place of the earliest of these block books is a matter for conjecture, but they were known in the early part of the 15th century. One of the most widely discussed of these is the 'Biblia Pauperum,' or Poor Preacher's Bible, several editions of which are known. It is a small folio containing 40 pages printed on one side only in a pale brownish ink by means of rubbing on the back. Each page is divided into five compartments separated by pillars, suggesting the idea of church windows. The central panel shows a scene from the Gospels and on the sides are illustrations from the Old Testament bearing on the central design. There are also texts and Latin verses. Another block book that has given rise to much speculation is the 'Speculum

The Fall of Lucifer, from the Speculum Humane Salvationis.

Humanæ Salvationis,' or The Mirror of Human Salvation.' In this the text appears to have been printed from movable type in black ink on a press. Other famous block books are the 'Apocalypsis Sancti Johannis,' Visions of Saint John; 'Ars Moriendi,' The Art of Dying; 'Canticum Canticorum,' or a History of the Virgin prefigured in the Song of Solomon. All of

WOOD ENGRAVING

these are curiously and often grotesquely medieval, full of the symbolism and mysticism of primitive humanity. Rude as they are, though, they were preparing the way for something better.

With the advent of printing the block books were superseded and wood engraving became

The Ploughman, from the Dance of Death, by Holbein.

a handmaid of the greater art. Illustrations are to be found in many of the books of the early printers. (This is not the place to discuss the question of who was the first to use movable type and the subject has already been treated under the head of PRINTING.) The earliest wood engravings in a printed book with an authentic date appear in the *Psalter of Faust* and Scheffer published at Mentz in 1457. From Cologne, Mentz, Nuremberg, Ulm, Augsburg, Strassburg and Basel came many printed books illustrated with wood engravings.

The Bible was the book on which the early printers spent most of their energies. Numerous editions were published with illustrations. The most important of these was the famous Cologne Bible which appeared before 1475. Its 100 designs were, after the block books, the first illustrations of Scripture, and they showed more originality and invention than anything that had gone before. Many of the decorative borders of this Bible are in curious contrast to the sacred text. Next to the Bibles in interest in the study of wood engraving are the numerous chronicles and histories. These are records of legends and imaginary events and are illustrated with wood cuts dealing with the lives of the saints and the great happenings in local history. One of the best known of these chronicles is the one published at Nuremberg in 1493. It has over 2,000 cuts supposed to be the work of William Pleydenwurff and Michael Wohlgenuth, the latter a master of the great Dürer. The chief distinction of the Nuremberg Chronicle lies in the fact that in it for the first time wood cuts were printed in simple black and white. They were modern in this respect and in the use of cross hatching by which grays and blacks of varying intensity were obtained by engraving lines that crossed each other at different intervals.

In France wood engraving was early identified with printing. Religious books contained many curious and often beautiful illustrations. Those known as the '*Livres d'Heures*' often contained many fine examples of carefully executed blocks in imitation of miniatures. Many of these early wood cuts served simply as an outline for the colorist, who often overlaid them with an entirely different design. The first really effective artistic use of the decorative border may be seen in these '*Livres d'Heures*,' and some of them are notably quaint embodiments of scriptural ideas combined with others that are certainly not to be found in the sacred book.

England lagged behind other countries in her art development, and wood engraving was little known there before the publication of Caxton's '*Game and Playe of Chess*,' published in 1476, and it is thought that the cuts in this were imported from Germany. In Italy the earliest wood engravings were either importations from Germany or were suggested by German originals. The most noted example of early Italian wood engraving is the '*Hypnerotomachia Poliphili*,' or Dream of Poliphilo, written by a Venetian monk in 1467 and printed by the famous Aldus in 1499. The Italians developed a method of engraving in *chiaroscuro*, in imitation of painting, by the use of several blocks, each printed in a different color. The Germans also employed the same methods, but in a much cruder form.

With the advent of Albrecht Dürer wood engraving reached its highest attainment. First of all he was a great designer with a far-reaching and powerful imagination and a mind full of the new learning and spirit of the coming Reformation. He was the first fully to realize

The Savages of Calicut, from the Triumphal Procession, by Burgkmair.

the great possibilities of wood engraving, and by his influence it was raised to the dignity of a fine art. He is known chiefly by four great works. The first of them the 15 large drawings illustrating the *Apocalypse* of Saint John. Others are the '*Larger Passion of Our Lord*,' 12 cuts, '*The Life of the Virgin*,' 20 cuts, and the '*Smaller Passion of Our Lord*,' 36 cuts.

WOOD-FROG — WOOD-LARK

Among Dürer's other famous works are the 'Car and Gate of Triumph' made for the Emperor Maximilian. Another great work celebrating the emperor's fame was Hans Burgkmair's magnificent 'Triumphal Procession,' etc.

A group of wood engravers known as the Little Masters, from the small size of their work, followed Dürer, but their work is of no special significance.

Hans Holbein ranks among the really great artists and wood engraving owes to him a still further advance. Holbein indeed might be well called the father of modern illustration. Among the first books he illustrated were the 'Utopia' of Sir Thomas Moore and the Biblical translations of Luther. He is best known, however, for his remarkable series of designs known as the 'Dance of Death,' a popular subject of mediæval times. In each of the 41 designs is a scene from common daily life expressed with a grim dramatic power and truth of drawing that are remarkable in a very high degree. Death spares neither the king nor the peasant, the praying nun nor the priest in the pulpit. Much of their success was due to the wonderfully accurate wood engraving of Hans Lützelburger, for in the hands of a less skilful engraver the originals would have lost much of their power. Holbein's designs for the Old Testament were also remarkable in many aspects, but they were more conventional in conception. After Holbein, wood-engraving as an art steadily declined.

Its revival, in a modern sense, began with the work of Thomas Bewick in England. To him we owe the great principle of the white line which did away with much of the old drudgery and gave the engravers more freedom in handling. In the old way where black lines crossed the little white lozenges between had to be laboriously cut away, Bewick simply gouged out with his graver a line and by varying the width and number, obtained his gradation of light and shade. He was the first also to use boxwood and the burin; the old wood engravers cut their designs on pear or apple tree boards with a knife. Bewick is best known by the drawings and engravings in his 'British Quadrupeds' and 'History of British Birds.' He was the founder of the modern British school which held for many years a distinguished place in modern illustrative art. Bewick's pupils, Nesbit and Luke Clennell; Robert Branstons, John Thompson, the Dalzels, William Harvey, and W. J. Linton engraved the work of many distinguished English artists. In France and Germany wood engraving has maintained a distinct place in spite of process and some of it has been and still is of a very high order of merit. It is to America, however, that we must look for the greatest achievement in wood engraving. Our artists have carried it to a degree of perfection unparalleled anywhere else in the world. They have taken it out of the domain of a largely mechanical handicraft and given it almost the individuality that belongs to creative art. The first American wood engraver of distinction, Dr. Alexander Anderson, was a follower of Bewick. His work appears in many early American books. Joseph Alexander Adams was another early American wood engraver whose work was even more worthy of study. The notable wood engravings made for the Harper Bible published in 1843 were done under his supervision.

To the great English and American magazines we owe the incentive and the opportunity for the development of the best wood engraving. Even before a way was discovered by which drawings might be photographed on the block, American engravers had begun to show their capacity for interpreting the lines and tones of drawings with exceptional accuracy and originality. In some instances attempts were made to copy the qualities of brush marks and the textures of different mediums such as pencil and charcoal, etc., but this was only a passing phase of an attempt at superior cleverness. W. J. Linton who spent the later years of his life in America was a leader in the effort to make wood engraving more of an individual art, and though he was not always in full sympathy with the tendency toward a greater refinement of line and an effort that seemed to him to be leading away from the legitimate purposes of wood engraving, he was a very great power for good. J. G. Smithwick, long identified with the art department of 'Harper's,' and A. W. Drake, of 'Scribner's Monthly' and the 'Century,' did their full share in the development of the art. Fredrick Juengling, J. P. Davis, Frank French, F. S. King, Wm. B. Closson, Henry Wolf, Thomas Cole, Thomas Johnson, Elbridge Kingsley, Gustav Kruell, William Muller and others are names identified with the highest attainment of American wood engraving. With the advent of process (see PHOTO-ENGRAVING) the demand for wood engraving has greatly diminished and its employment as a reproductive art is constantly decreasing. It is a beautiful art as exemplified by the best practitioners, remarkable for its brilliancy of effect in pure black and white, requiring the most delicate skill in its manual execution and a feeling and invention with respect to the correct interpretation of values and textures of a very high order.

With the passing of the men of to-day who have given wood engraving a place among the fine arts, it is likely that it will cease to be a field for further endeavor. There are no longer incentives for its study, and the time and artistic training necessary for any real accomplishment can be put to much better profit in other directions. Prints by famous engravers are already much sought by collectors, and the future historian of the art will probably end his record with the close of the 19th century and the beginning of the 20th.

More than to any other of the graphic arts are we indebted to wood engraving. It led the way to the invention of printing and has been the means of putting before the world a record of the progress of the greater arts of drawing and painting.

JAMES B. CARRINGTON,
Assistant Editor 'Scribner's Magazine.'

Wood-frog. See FROG.

Wood-ibis, a kind of stork (q.v.).

Wood-lark, a European lark (*Lullula arborea*) closely allied to the sky-lark (q.v.), but distinguished by its smaller size, shorter tail, a distinct light streak over the eyes and ears, and more distinct markings on the breast. It perches upon trees, and is found chiefly in fields near the borders of woods. Its flight is much less extensive and powerful than that of the sky-lark. The wood-lark often sings during the

WOOD-LOUSE — WOOD-SORREL

night, and on this account has been mistaken for the nightingale. "Its song" is described as "sweet and flute-like, more melancholy than that of the sky-lark, and is generally uttered from the top of some tree or else when the bird is on the wing. It rises to some height before commencing, then ascends, singing, higher and higher, throwing itself from side to side, hovers and floats in the air, and when the song is ended drops with closed wings to the ground again." It bears confinement well, singing sweetly in the cage, and even breeding easily there or in an aviary: hence it is constantly caught and kept. The nest is generally built under bushes. The eggs are five in number, of a dusky color, spotted with deep-brown spots.

Wood-louse, one of the little isopod crustaceans (see ISOPODA) of the family *Oniscida*, which abound underneath logs and in decaying stumps in the woods, and which, when touched, curl up for protection like armadillos. They are numerous and hardy, the sexes are distinct, and the young are hatched from the eggs in their full form, passing through no metamorphoses.

Wood-mouse, the red-backed mouse (q.v.). In England the long-tailed field-mouse (*Alus. sylvaticus*) is so called.

Wood Nymph, a minor pagan divinity supposed to live in trees and woods. This is the common name, also, of the beautiful lepidopterous insects comprising the genus *Eudryas*.

Wood Oil, the name given in commerce to a resinous juice which exudes from various trees of eastern Asia. It has a fine aromatic color, and is used for a great variety of purposes; in medicine as a substitute for copaiba balsam; by sailors for paying the seams of a ship instead of tar; by painters as a varnish; also in the making of lithographic ink, etc. It is an excellent preservative of timber against the attacks of white-ants. The substance is strictly an oleo-resin, and is also known as gurun balsam.

Wood-pewee. See PEWEE.

Wood-pulp, a substance consisting of ground spruce or other wood used in the manufacture of paper. (See PAPER AND PAPER-MAKING.) The modern newspaper is printed on paper made wholly of wood pulp, and of all the paper produced in the United States, New York city uses one eighth for its newspapers. It is estimated that all the paper mills of this country turn out about 4,000 tons each day, and of this the newspaper presses of its chief metropolis consume 500 tons. Were it not for the tremendous capacity of the modern paper-making machine, the newspaper of to-day would have been unable to attain its present size. Some of the largest mills run at a speed of 500 feet of paper a minute, or about as fast as a horse traveling six miles an hour. The width of news paper varies from 60 to 160 inches. One of the largest paper machines in the world, which is in operation in Rumford Falls, Maine, turns out 80 miles of paper in 24 hours, weighing nearly half a ton to the mile.

So far have mechanical devices usurped the work of human hands in the manufacture of paper that at the present time a machine will feed itself with logs at one end and turn out the finished roll of paper at the other. So gigantic is such a machine that it takes only from 8 to 12 hours to transform the raw material into

the finished product. It first saws up the logs of spruce, which have been floated down the stream to the mill, takes off their bark, and then grinds them into pulp under a flow of water. The pressure of the grindstone on the wood is sometimes as great as 500 horse-power, or one fourth that of the most powerful locomotive built.

The pulp is then boiled in a solution of sulphuric acid, which has destroyed the woody fibre, and it has also been mixed with clay to give a smoother surface, rosin to size it and prevent the ink when printed on it from spreading, and bluing to whiten it. The pulp, mixed with three times its amount of water, flows along till it reaches an endless ribbon of wire, which is a little wider than the intended width of the paper. The spread of the pulpy water sideways is prevented by two endless rubber straps, one at each edge of the wire.

It is while the "stock," as the pulpy mass is called, is being drained on the rapidly moving wire ribbon that to it is given the water-mark. Resting on the wet mass and revolving as it passes along under it is the "dandy roller," a light cylinder covered with wire. Whatever design it may have on its surface it imparts to the wet mass on which it rolls. Other rollers now press out more water, so that soon the paper can carry itself, and on huge cylinders heated by steam inside it is dried. It then passes through a stack of chilled iron rollers, piled up on top of one another, for the purpose of giving it a smooth surface. From the "calenders," as these rollers are called, the paper is trimmed and wound off on a roll.

Wood-quail, or Roulroul. See QUAIL.

Wood-rat, a large rat-like wild mouse of the genus *Neotoma*, of which two species dwell in the forests of the southern half of the United States. The body is 8 or 9 inches long, and the tail nearly as long. The form resembles that of the white-footed mouse (*Microtus*), the animal being more slender and squirrel-like than are the true or house rats, from which this may always be distinguished by his hairy tail, softer fur, and much larger ears. The best known species is the Alleghany wood-rat (*N. pennsylvanica*), which is lead-color above, sprinkled with black hairs, which lightens to yellowish on the flanks and becomes pure white on the abdomen and feet. "The Alleghany wood-rat," say Stone and Cram, "inhabits wild rocky ledges along the mountains, where he can seek shelter among the loose piles of broken rocks, or in the crevices and caves usually present in such localities. Here he gathers a mass of sticks, shreds of bark, leaves, and other debris to serve for a nest, building it sometimes into a more regular dome-shaped structure. He seems to feed on whatever the forest offers, both vegetable and animal, and in large caves, where foxes or wildcats have dragged their prey, the marks of the wood-rat's teeth are found abundantly on the bones which the more powerful beasts have left behind them. . . . The closely related Florida wood-rat is said to build its nest in dense swampy thickets, but probably differs little in general habits from its more northern relatives." Consult Stone and Cram, 'American Animals' (New York 1902).

Wood-robin, the wood-thrush (q.v.).

Wood-sorrel. See SORREL.

WOOD-THRUSH—WOOD-WORKING MACHINERY

Wood-thrush, or **Wood-robin**, the most familiar of North American spotted thrushes (*Hylochichla ustulata*), famous for the rich four-parted melody of its spring song. It is numerous in warm weather throughout the Eastern States and Canada, inhabiting the wild spaces as well as confidently approaching the house and roadside. Its nest is often built in a village shade-tree, or even in a garden bush, but more frequently among the forking twigs of an apple-tree; and it is to be distinguished from that of the robin by the absence of mud and the presence of many dead leaves, which always form the principal part of its foundation. The eggs are deep blue, smaller and less greenish than those of the robin. It soon becomes unsuspicious of the persons whom it is accustomed to see about the place and who do not disturb it, but is jealous of the attention of other birds, and defends its home with admirable vigor and

Wood-working Machinery includes the various machines employed to reduce the lumber cut in the forests into doors, sashes, moldings, etc., used for industrial purposes. They may be conveniently divided into four general classes—saws, which operate by rending or scission; planers, by which the work is accomplished by a paring action; lathes, in which the wood is turned or pared while being revolved; and grinders or abrading machines, which are generally employed as finishers, and accomplish the work through the medium of sand or emery. Saws are blades of steel with toothed edges and are used to divide metal, and stone, but the principal modern use of the saw is to divide wood. For saws used in metal-working see **METAL-WORKING MACHINERY**. The use of saws is of very ancient origin, and it is practically impossible to enumerate in detail their adaptations to various mechanical processes.

Gang Saw.

success. The song, which is heard most frequently and pleasingly toward sunset, is excelled by that of none of the more familiar Eastern birds either in musical quality or in sentiment. It is low, sweet, evenly modulated, and flute-like, yet has far-carrying power, and when heard at twilight across the fields, or from unseen recesses of the orchard, it brings to the mind a hymn chanted in praise of the serenity of the summer evening. This thrush is bright cinnamon above, brightest on the head; below white, with large rounded black spots forming lines down in front.

Wood-warbler, a book-name for the small and beautiful American birds of the family *Mniotiltidae* (see **WARBLER**); but the name is without special significance, as these birds are not more characteristic of woodland than of other places; nor than other warblers.

Among uncivilized peoples, saws were made of flakes of flint imbedded in wooden blades and held in place by means of bitumen. Later, among the ancients, bronze saws were used, but all modern saws are made of steel of the finest quality. The saw is practically an exaggeration of the knife, the edge of which, although presenting a smooth appearance to the unaided eye, shows an array of saw teeth when viewed under a microscope. Saws are of four general types—"straight," with flat blades and straight edges, reciprocating in action, and making a plain cut; "circular," with flat circular blades, and cutting at right angles to the motion which is continuous; "barrel," cylindrical in shape, and cutting parallel to the axis; and "band," endless ribbons of steel, toothed on one of the edges, and running over two pulleys, one above the other, with a continuous cutting motion parallel to the axis.

WOOD-WORKING MACHINERY

Any of them may be designed for cross-cutting or for ripping purposes. In the cross-cut saws the teeth are designed to cut at right angles to the fibre of the wood, while in the rip-saws the alternate teeth are bent outwardly or "set" so that they make a broader gash than the thickness of the blade and prevent binding or sticking. Saw teeth are made long or short, and pitched to cut one way or both ways, according to the kind and character of the timber to be sawn. The "pitch" of a tooth is the angular position of its point relative to the edge of the

creased rigidity is obtained only by an increase in thickness, which in turn results in the cutting of a wide gash, and a consequent increase in the kerf-waste or saw-dust. Therefore, the use of saws exceeding 72 inches in diameter is not considered economical. In operation, they are run at speeds ranging from 5,000 to 9,000 feet per minute, and are capable of cutting, on the average, about 80,000 superficial feet of lumber per day of 12 hours, as against 6,000 to 10,000 feet, by the straight saws. The wear on circular saws is very great, and the

Circular Saw, with Rack-feed.

blade, and it is determined by subtracting the angle of the back edge from that of the front edge of the tooth. The normal pitch is 60° , which is generally applicable to all saws, from those used in the largest sawmills to the smallest hand saws. The blade of the hand saw is broader at one end than at the other, and is provided with a wooden handle attached to the broader end. The largest straight saws are called "pit-saws," and were the earliest employed in the manufacture of lumber. They were operated by two men, one standing over the log and drawing upward, while another standing in the pit below followed with the downward or cutting stroke. The demand for larger quantities of sawmill products, developed the arrangements known as "gate," "gang," and "muley" saws, and later the "circular" saws, which were introduced in England about the close of the 18th century. The first patent was granted to Samuel Miller in 1777, but a general announcement of the principle appears to have been made by Brunel about 12 years later.

The circular saw is a disk of the finest steel, with teeth on its edge. At first only those of small diameter were used, such as the buzz-saw of the watchmaker, for minute work, and the ripping-saw of the carpenter shop and the planing mill; but now they are made in diameters ranging from 1 to 84 inches, and the larger sizes are used as the main saws of most of the larger sawmills. In the principal lumbering districts of the United States, they are usually 72 inches in diameter, while those employed on the Pacific coast often run up to a diameter of 8 feet. In design, the diameter of a circular saw is governed by its rigidity or the capacity to maintain a true plane of rotation during the process of cutting. This property decreases as the diameter increases, which is exactly the reverse of what is required. In-

crease in thickness, which in turn results in the cutting of a wide gash, and a consequent increase in the kerf-waste or saw-dust. Therefore, the use of saws exceeding 72 inches in diameter is not considered economical. In operation, they are run at speeds ranging from 5,000 to 9,000 feet per minute, and are capable of cutting, on the average, about 80,000 superficial feet of lumber per day of 12 hours, as against 6,000 to 10,000 feet, by the straight saws. The wear on circular saws is very great, and the

Band Saw.

out are easily replaced by new teeth, at a comparatively small expense. Barrel saws are metal cylinders shaped like a straight-sided barrel open at both ends, and with the edge of one end toothed. They are employed in manufacturing the staves for barrels, pails and tubs. Band

WOOD-WORKING MACHINERY

saws were invented about the beginning of the 19th century, and although their particular merits were known long before the circular saws came into general use, they were not adopted until the latter part of the century, owing to the difficulty of making saws capable of withstanding the severe service. But, with the manufacture of the finer grades of steel of greater tensile strength and elasticity, since 1885, they have been adopted in addition to the circular saws in many of the larger mills. They are made in sizes ranging from $\frac{1}{2}$ inch in width,

cut various ornamental designs for brackets, corner-pieces, clock-cases, etc.

Of saws used for special purposes, the segment saw used for cutting veneers, and the wire saw employed for cutting stone, are interesting as examples of the application of the tool for exactly opposite purposes. The segment saw is circular in shape, and is formed by bolting the segments of the blade, which are extremely thin, upon the outer edge of a strong cast-iron centre, which gives the required rigidity. The larger sizes range from 6 to 8 feet in diameter,

Planer, with Roller-feed.

used for ordinary shop-work, to from 6 to 8 inches in width, for the use of the larger lumber mills. In mode of operation, which is as that of a belt over two pulleys, they cut with a continuous motion, with the toothed edge always in the gash. Being made extremely thin, they are used for continuous and rapid cutting in planing mills and other wood-working plants, where the cuts are made in scrolls and curves, and require

and possess cutting edges so light, that they are capable of cutting veneers almost as thin as a sheet of paper. The wire saw, on the other hand, is a form of band saw, and consists of an endless strand of three steel wires which is kept moving upon the stone while sand and water are fed to it. The grains of sand are caught in the spaces between the wires and are dragged along, and by abrading the surface

Copying Lathe.

a very flexible blade. The thinness of the blade insures a much smaller kerf-waste than that resulting from the circular saw, and as installed in their larger forms in the lumber mills are capable of sawing an average of 40,000 feet of lumber per day. The saws commonly known as scroll saws and jig saws, are very narrow straight blades of steel, often as fine as $\frac{1}{16}$ of an inch in width, which are operated to give a reciprocating movement, and are employed to

result in cutting a groove. The wires are kept constantly pressed against the bottom of the groove by the aid of two pulleys, one on each end of the cut. When the cut is vertical, the pulleys are placed on suitable forms in small pits, and are so arranged that they can be fed downward by the means of screws. Planers are used to reduce lumber to exact dimensions by smoothing down the rough surfaces of the product of the sawmills. In the surface planer this

WOOD-WORKING MACHINERY IN THE UNITED STATES

is accomplished by a series of revolving cutters which pare off shavings and leave the surface of the timber quite smooth. The cutters are very ingeniously arranged, and in many cases all four sides of the board or beam are planed down, and the tongue and groove cut in the edges, at one operation. The cutters may be so arranged as to produce curved surfaces by following a pattern, and are extensively used in the manufacture of moldings, panels, etc. To this class also belong the dove-tailing machines in which the cutters are arranged in gangs, similar to a gang of chisels, or revolve upon a vertical spindle. They cut out the tongues and spaces automatically. Wood-working lathes are similar in principle to those employed in metal-working. The piece of wood is held between the stocks of the machine and revolved rapidly, while a chisel or other tool is pressed against it and removes a shaving by a combined paring and severing action. By the use of various automatic duplicating attachments in conjunction with patterns, as in the case of the Blanchard lathe, in which patterns and blanks are revolved together, exact facsimiles are readily obtained, and the output of the machines greatly increased. Other machines involving the lathe principle, are the various kinds of borers, for drilling holes; tenoning machines and mortising machines, for making tenon joints and the mortises to receive the tenons; and gaining machines for cutting grooves. Abrading machines are of two kinds—those in which an endless belt coated with sand or emery is brought in contact with the work, generally of small dimensions; and those in which a drum similarly coated is employed to work down large surfaces. See also SAWMILL.

W. MOREY, JR.,
Consulting Civil Engineer.

Wood-working Machinery in the United States. Machinery for working and cutting wood has been brought to greater perfection in the United States than in any other country on the globe; and almost every country in the world has copied the American designs to a very great extent. The manufacture of wood-working machinery in the United States began around Keene, N. H., and Lowell, Mass., and was started by planing-mill men, who saw that they must have something to work wood besides hand tools. They made machinery for themselves so successfully, and at such a great saving of labor, that they concluded they would build it for the trade in various sections of the country. Among the early and most successful builders was J. A. Fay, a resident of Keene, N. H. In building machinery, a great many of his machines were made with large wooden frames; for instance, a machine that was known as the Daniels planer, and to obviate the necessity of carrying these large, heavy frames over the mountains without railroads, he concluded to open a branch establishment at Cincinnati. The child outgrew the parent, and made Cincinnati among the cities of the United States famous for her wood-working machinery. In fact, there is more wood-working machinery made in Cincinnati than in any other city in the world; and from such small beginnings, the business of that city has been handled so well and in such an enterprising manner that it has taken the lead in all sections of the world. For

instance, one of the companies from Cincinnati, in 1889, at the World's Fair in Paris, was awarded the Grand Prix; at the World's Fair in Chicago, in 1893, was awarded 22 medals; and again in 1900, at the World's Fair in Paris, received the Grand Prix, while the president and manager of the institution, Thos. P. Egan, was decorated with the ribbon of the Legion of Honor for the great improvements and advantages that his company has made in wood-working machinery.

A large number of machines originated among the great German cabinet trade in Cincinnati. Machinery that is now known all over the world, such as friezing or shaping machines, originated and was first made and used in a factory in Cincinnati. So with the jig or unstrained scroll saw; and the great improvements in almost every branch of the line have first originated there. The output now in the various factories of Cincinnati is fully \$10,000,000 per annum. Many of the manufacturers previously in this line made both wood-working machinery and iron tools, although they were two separate branches of business; but the later and newer factories have separated these two branches, one taking the wood-working machinery and another branch the iron tools. The tool business in Cincinnati has equaled the wood-working machinery business, and such system has been brought to bear on it that each manufacturer has taken up a special branch of the business. For instance, one concern manufactures entirely lathes; another nothing but planers; a third nothing but drill-presses, even this latter business being divided into radial and vertical presses; and a fourth makes nothing but milling-machines. People in Cincinnati have originated and designed a method of working their machinery by jigs, templates and special tools. They have surpassed all sections of the world and devised measurements and special jigs of which the world has never before seen the like. Sizes and fits are made to the ten thousandth part of an inch; in fact, that is a very common fit. Every appliance and labor-saving device that can be employed in machinery to cheapen its production and make its working parts more accurate can be found in these vast establishments. The engineers of the world who are building either wood-working machinery or iron tools, come to Cincinnati to get their designs and equipments, both for their drawing-room, for their tool-room, and for their working equipment in the shop. Mechanics from these establishments have spread all over the entire globe and tried as far as they could to communicate and carry the system as used in Cincinnati. For instance, a man starting a shop in any section of the world is likely to come to Cincinnati and hire his superintendent or practical man; but the work here is so systematized that very few men can carry more than their special line or special little section that they do business in, and it would be necessary to hire half a dozen experts to carry out what one man wants to know. This has its advantages as well as disadvantages, as it is sometimes difficult to hire so many men out of one factory, since they are very highly paid, and the system of workmanship is of such advanced character that a man can pass from one factory to another if he wishes to change his business. This he can not do in most other cities. Cincinnati on this account has the distinction of

WOODBERRY — WOODBURY

having more manufacturers doing a direct export business than any other city in the United States, and many factories in special lines, such as wood-working machinery, iron tools, electric motors, engines and boilers, and similar work, have the largest individual plants by far in the world, so that it is very easy for the smaller ones to congregate around these and take the overflow. This is a great advantage for the small factory and is not duplicated in any other city. There is no city in the United States, or probably in the world so specialized as Cincinnati. Even the foundry is always a separate institution, and there are very few foundries in Cincinnati that have anything connected with them, as each plant is especially run as a job foundry. Cincinnati has by far the best small factories for making special supplies for machine people. This might not be looked upon as a great convenience; but it is such, as it is known that machine men within a radius of 300 miles from Cincinnati come here once or twice a week to shop and buy their small specialties, such as special screws, special steel, special babbitt-metal, and special trimmings of any kind can be had here to better advantage than in almost any other city in the world. This is part of the business that has grown up to accommodate itself to the peculiar trade of Cincinnati. Cincinnati has greatly benefited by the small beginnings of such men as J. A. Fay, John Steptoe, and Miles Greenwood, these being the manufacturers and engineers of half a century ago. Among engineers and designers that operate factories of to-day are, Thos. P. Egan, George Bullock, William Lodge, J. C. Hobart, H. M. Lane, James Powell, Carl F. Lunkenheimer, H. Bickford, and Geo. A. Gray.

THOS. P. EGAN.

Of J. A. Fay & Egan Company, Cincinnati.

Woodberry, wūd'bēr-i, **George Edward**, American critic and poet: b. Beverly, Mass., 12 May 1855. He was graduated from Harvard in 1877, became professor of English in the University of Nebraska, in 1878-9 was on the 'Nation' staff, in 1879-80 was again at Nebraska, and subsequently, until 1891, was in active literary work, holding the literary editorship of the *Boston Post*, and contributing much to the 'Atlantic.' From 1891 until his resignation in 1904 he was successively professor of literature and of comparative literature (from 1899) in Columbia University. He became known as an authoritative critic, and a poet of much distinction, and must be ranked among the most scholarly and important of the more recent American litterateurs. The titles of his works include: 'A History of Wood-Engraving' (1893); a very valuable 'Life' of Poe (1885; 'American Men of Letters'); 'The North Shore Watch, and Other Poems' (1890); 'Studies in Letters and Life' (1890); 'Makers of Literature' (1900); 'Nathaniel Hawthorne' (1902; 'American Men of Letters'); 'Collected Poems' (1903); and 'America in Literature' (1903). He also edited the poetical works of Shelley (1892); Poe's works (1894; with Stedman); Lamb's 'Essays of Elia' (1892); and Aubrey de Vere's 'Select Poems' (1894). He is also editor of the 'Journal of Comparative Philology.'

Woodbridge, **William**, American politician: b. Norwich, Conn., 20 Aug. 1780; d. 20 Oct. 1861. He removed with his father to Ma-

rietta, Ohio, in 1791, but studied law at Litchfield in his native State and in 1806 was admitted to the Ohio bar, becoming a member of the Ohio assembly the next year. A State senator, 1808-14, as well as county attorney, he was appointed secretary of Michigan Territory in 1814, was territorial delegate to Congress 1819-20, and judge of the supreme court of the Territory 1828-32. In 1837 he became a State senator, was governor of Michigan, 1839-41, and a United States senator 1841-7. The remainder of his life was passed in Detroit.

Woodbridge, N. J., township, Middlesex County; on Staten Island Sound, and on the Central of New Jersey and the Pennsylvania R.R.'s; about 25 miles southwest of New York. It has regular steamer connection with New York. It has valuable deposits of fire-clay, and the chief industrial establishments are brick, tile, and drain pipe works. The township contains several villages. It has a high school, established in 1876, public and parish graded schools, and a public library. Pop. (1890) 4,665; (1900) 7,631.

Woodbury, wūd'bū-rī, **Daniel Phineas**, American soldier and military engineer: b. New London, N. H., 16 Dec. 1812; d. Key West, Fla., 15 Aug. 1864. He was graduated from West Point in 1836 and was appointed second lieutenant of artillery. He was not long afterward transferred to the engineers and became a major in 1861. At the opening of the Civil War he was assigned for engineer duty in the Army of the Potomac and was active in planning the defenses of Washington. While commanding the engineer brigade he controlled all the engineering operations in the siege of Yorktown and those before Richmond, and his prompt action at the battle of Fredericksburg in bridging the Rappahannock, won for him the brevet of brigadier-general in the regular army. While in command of the Key West district he died of yellow fever. He published 'Sustaining Walls' (1845); 'Theory of the Arch' (1858).

Woodbury, **Levi**, American jurist: b. Francetown, N. H., 22 Dec. 1789; d. Portsmouth, N. H., 7 Sept. 1851. He was graduated at Dartmouth in 1809, studied law, was admitted to the bar in 1812, and practised his profession at Francetown till 1816, when he was elected clerk of the State senate. In 1817 he was appointed a judge of the superior court, and in 1823 he was elected governor of New Hampshire, and in 1825 represented Portsmouth in the State legislature and became speaker of the House. He sat in the United States Senate 1825-31, and on the expiration of his term was elected in March 1831 to the State Senate, but declined the offer in order to accept that of secretary of the navy, to which he had been appointed by President Jackson. In July 1834 he was transferred to the office of secretary of the treasury, which he retained during the remainder of President Jackson's second term of office, and the whole of President Van Buren's administration, retiring on the inauguration of President Harrison 4 March 1841. During this period the post of chief justice of the superior court of New Hampshire was offered him, but was declined. In 1841 he was again returned to the United States Senate, but resigned in 1845 on account of his appointment as

a justice of the Supreme Court, an office which he held till his death. He was a highly influential member of the Democratic party and at the time of his death was considered its most likely presidential candidate.

Woodbury, N. J., city, county-seat of Gloucester County; on the Delaware River, and on the West Jersey & Sea Shore (Pennsylvania) Railroad; eight miles south of Philadelphia. The chief industrial establishments are glass factory, chemical works, piano factory, and machine shops. Woodbury ships large quantities of fruit and vegetables. In 1900 (government census) the city had 81 manufacturing establishments capitalized for \$1,129,715. The value of the finished products, each year, was \$888,612. There are six churches, a high school, public and private schools, and a public library. The three banks have a combined capital of \$300,000. In 1903 the combined deposits amounted to \$1,243,000. Pop. (1890) 3,911; (1900) 4,087.

Woodburytype Printing, a process for obtaining by means of photography a picture or illustration for press printing. This process was invented in 1901 by W. B. Woodbury, and is the only photo-mechanical one which, in the printing press, realizes the gradations of tone without grain or texture of any kind. The idea of the process emanated from the carbon print, in which the picture is formed in all its gradations by various thicknesses of pigmented gelatine, the shadows, representing the greatest thickness, being in relatively high relief, and the high lights the lowest. Mr. Woodbury conceived the idea of making an electrotype mold of a carbon picture, and using the mold so obtained as a printing surface by covering it over with warm pigmented gelatine, and by flat pressure attaching a sheet of paper to the pigment, so that when the gelatine jelly was set he could detach it from its mold and thus by repeating the operation obtain unlimited copies. This was practically the Woodburytype; but of course there were difficulties and imperfections, which the inventor quickly set to work to overcome. He found that a thick film of gelatine and bichromate, when exposed under a negative and washed, gave a very high, sharp relief; and he also found that when this relief was perfectly dry it possessed the property of being absolutely incompressible, in other words, it was as hard as steel, and could be used as a die. The relief film of gelatine was placed on a block of smooth, hardened steel, with raised edges, upon this was laid a sheet of type metal or lead about a quarter of an inch thick, and the arrangement was then placed under a hydraulic press capable of exerting a pressure of about 40 hundredweight to the square inch. The pressure forced the lead into the gelatine image with such accuracy that every shade and detail of the relief was impressed. The raised edges round the steel block prevented the metal from squeezing out, and on being detached, a mold in lead was obtained which could be used as a printing surface for thousands of copies. The seemingly delicate relief in gelatine was quite uninjured by this treatment, and would serve for any number of further pressed molds.

The printing press for these pictures is special, but quite simple. It is formed of a cast-iron base, on which is fitted a movable table

to hold the mold, which is bedded down on to it with gutta percha; over the table is a hinged lid, faced with plate-glass, with a lever attachment for giving the pressure. The printing ink is a solution of gelatine in a hot state to which a pigment is added to give any desired tint. In printing the lead mold is first oiled to prevent the gelatine sticking, and a pool of the warm ink is poured on to the middle of the mold; over this pool is laid a sheet of paper water-proofed with shellac, and the lid of the press is brought down over the whole, and pressure applied. The pressure squeezes out over the edges of the mold all superfluous ink, and all that is left is that retained in the graduated hollows and depressions of the lead mold; the warm ink sets in a few minutes, and on opening the press the paper support is removed with its gelatine copy of the molded picture firmly attached to it.

Woodcock, any of several birds, particularly certain snipe-like birds of the family *Scolopacidae*. The American woodcock, duck snipe, bog-sucker, big-headed snipe, mud snipe, etc., as this bird is variously named by gunners, is the *Philohela minor* of ornithologists. The body is full and robust; the wings short and rounded; the head and eyes very large, and the bill straight, tapering from the stout base, grooved for nearly the entire length and exceedingly sensitive at the end; there is practically no gape; the ear is situated beneath the eye; the legs are very short for a snipe, and the tibiae are fully feathered. The woodcock is 10 or 12 inches long and weighs from 7 to 9 ounces, the females being the larger. The colors are a soft harmonious blending of various shades of brown and gray, with black mottling above, nearly uniform pale brown below. Except that it invades Ontario and other southern provinces of Canada the woodcock seldom ventures beyond the limits of the eastern half of the United States at any season. In winter it migrates to the South Atlantic and Gulf States, but most of them breed in the central and northern States. Migration northward begins very early and many of the more hardy individuals reach the Middle and New England States in early March before the frost has left the ground. At such times, and also in the late fall, they secure their food, consisting of insects and their larvæ, snails, etc., by turning over fallen leaves, but during the summer and whenever the ground is sufficiently soft they probe it with their long sensitive bills and with great skill extract the earthworms which constitute their chief food, and of which enormous quantities are consumed. They frequent bogs and swampy places along alder-grown streams, hillside springs, etc., during the summer; but in the autumn forsake these coverts for cornfields and the undergrowth of low woods, the surest indication of their presence being their perforations in the soft earth. Few birds are more uncertain in the choice of their feeding grounds, changing from high to low as the weather varies from wet to dry. Their solitary habits are no doubt the result of the character of their favorite food, to obtain which they not infrequently search city lawns after nightfall. As the large size of the eye suggests, the woodcock is crepuscular and nocturnal, the period of its greatest activity being in the hours immediately succeeding sunset and

WOODCHUCK—WOODEN WALL

preceding dawn, though, especially when moonlight, it may be abroad throughout the night. During the day it remains hidden in deep bogs and thickets, rising only when forced and then springing perpendicularly above the bushes it flies in an irregular course for a short distance and drops as suddenly to the ground and its concealment.

Mating takes place as soon as the sexes meet in the spring and is followed in April or even earlier by the building of a simple nest of leaves and grass in a dry and well concealed spot in a bog. Four or sometimes five buff or clay-colored eggs variously spotted with dark brown and lilac are laid, and after three weeks of incubation yield the fluffy, brownish-white young, which at once leave the nest led by the old birds to the feeding grounds. The love antics and nuptial flights of the male are curious and interesting. In the former he is a diminutive of a turkey cock; in the latter he mounts in the darkness of night on swift wing high in the air above a wet meadow, then falls like a shot with a whistling sound as the air rushes through his tail and wing-quills. He has also a simple whistling vocal note. The female especially is very solicitous in the care of her young and not only feigns injury in order to entice an intruder from their vicinity, but frequently has been observed to bear them one by one between her thighs to a place of safety. Later in the summer the members of a family scatter to feed singly in their home-bog and with the advance of fall seek the uplands as above described. With the coming of hard frosts most of the woodcock leave for the South and become concentrated in favorite bottoms along the lower Mississippi and other sections of the Gulf States. There and at this time the outrageous practice of fire-hunting is indulged in, chiefly by negroes and market hunters. One person bears a torch which lights the ground and confuses the birds which are often killed in great numbers by a second person with gun or club as they crouch confused on the ground. It is to this practice, as well as to the equally to be condemned spring and early summer shooting still permitted in some of the northern States, that the almost threatened extinction of this fine bird in many parts of the country is to be largely traced. Among natural enemies of the woodcock are minks, hawks, owls, red squirrels, cats, and snakes.

Next to the quail the woodcock is probably the most popular game bird of the eastern United States, and deservedly so, but its numbers have greatly decreased since about 1880. To save it all gunners should unite in abolishing spring and summer shooting and in restricting the great destruction which takes place in the Gulf States during the winter by the absolute prohibition of fire-hunting and similar barbarous methods. In every respect fall hunting is the most delightful sport, and the birds are then in the best condition for the table. Most gunners prefer a cocker or other spaniel for flushing the birds from thick coverts and much the same style of gun and ammunition as quail shooting requires. The successful woodcock shooter must be a quick and steady shot, for these birds are as changeable as the Wilson's snipe in their moods, and their coverts offer greater difficulties. When shooting in cornfields the gunner sometimes stands on an

elevated platform so that he can overlook the stalks among which his dogs are quartering.

The European woodcock, which occasionally occurs in this country, is a much larger bird and belongs to the genus *Scolopax*, which has long pointed wings, in which the outer primaries are neither much shortened nor attenuated. Its color is a brown of various shades, of darkest hue on the back, while the tail is black above, tipped with gray. Their habits are very similar to those of the American kind.

Consult: Lewis, 'American Sportsman' (Philadelphia 1868); Fisher, 'Yearbook,' United States Department of Agriculture for 1901.

Woodchuck, or Ground-hog, an American marmot (*Arctomys monax*), 18 to 24 inches long, grizzled above, and chestnut red below, the feet and tail blackish. It is found from Hudson Bay to South Carolina, and west to the neighborhood of the Rocky Mountains, several distinct sub-species and varieties appearing in this wide range. It digs deep holes in the fields, on sides of hills, or under rocks in the woods, in a slanting direction, at first upward to keep out the water, with several compartments, and usually with more than one entrance. It passes the winter in the burrow, in a dormant state. The digging is effected by the powerful fore feet, assisted by the teeth, the dirt being thrown backward under the belly and then kicked out by the widespreading hind feet. The food consists of various plants, fruits, and vegetables; they are especially fond of red clover, often doing great mischief to this crop, and to gardens; another favorite food is celery.

Woodchucks feed chiefly during the early morning and late afternoon and spend most of the remaining time lying in the sun or sleeping in the nests at the bottom of their burrows. They become extremely fat and retire to hibernate on the first intimation of approaching winter and only appear after the snow is gone in the spring. A large brood of young is born in the spring or early summer and when a few months old they are forced to leave the burrow and to shift for themselves. The woodchuck is generally a bold and unsuspecting creature, but has alert senses and where much persecuted may become vigilant. When driven to bay it may fight with considerable courage and effectiveness. Its chief natural enemies are foxes and skunks, but the animal remains generally abundant in both cultivated regions and woodlands in the New England and Middle States. Consult Ingersoll, 'Wild Neighbors' (New York 1898).

Wooden Wall, the side of a ship; hence the ship itself. When Athens was in imminent danger from the Persians 483 B.C., during the invasion of Xerxes, the oracle at Delphi was consulted, and, intimating that the city and country were doomed to ruin, added that—when all was lost, a wooden wall should still shelter her citizens. The Athenian young men interpreted "a wooden wall" to signify ships; Themistocles, who had probably influenced the oracle to utter the prediction or counsel it had given, was of the same opinion; faith was put in the navy, and the result was the great victory of Salamis. It was from this incident that the expression, "The wooden walls of England," arose.

WOODFALL — WOODPECKER

Woodfall, Henry Sampson, English printer and journalist: b. London 21 June 1739; d. there 12 Dec. 1805. From about 1758 until 1793, when he disposed of his interest and retired, he conducted the 'Public Advertiser,' among the contributors to which was Sir Philip Francis (q.v.). He printed the 'Letters of Junius' (see JUNIUS), which have been conjecturally assigned to Francis. Woodfall, however, is on record as stating that he definitely knew Francis "never wrote a line of Junius." After the Junius letter to the king had appeared in the 'Advertiser,' Woodfall was prosecuted for libel by the crown, but the verdict rendered was practically one of acquittal. In 1797 Woodfall was master of the Stationers' Company. The 'Advertiser' ceased to exist in 1795.

Woodford, Stewart Lyndon, American diplomat: b. New York 3 Sept. 1835. He was graduated from Columbia in 1854 and admitted to the bar three years later, beginning practice in his native city in 1857. He served in the Federal army 1862-5, being at one period military commandant of Charleston and Savannah, and becoming brevet brigadier-general of volunteers. He was lieutenant-governor of New York 1866-8, but in 1870 as the Republican candidate for governor was defeated. A member of Congress 1873-5, and attorney for the southern district of New York 1877-83, he subsequently engaged in private practice, but was appointed minister to Spain in 1897, returning to the United States the next year on the opening of the Spanish-American War.

Woodland, Cal., city, county-seat of Yolo County; on the Southern Pacific railroad; about 85 miles northeast of San Francisco, and 20 miles north of Sacramento. It is in an agricultural region, in which wheat and grapes are among the chief products. Many sheep are raised in Yolo County. The chief industries are connected with raising and shipping grapes, manufacturing wine, and shipping wheat, fruit, barley, wool, and live stock. The educational institutions are Holy Rosary Academy (R. C.), Hesperian College (Disciples of Christ), opened in 1861, a high school established in 1895, graded elementary public and parish schools. The four banks have a combined capital of \$1,468,700 and, in 1903, deposits amounting to \$1,638,440. Pop. (1890) 3,069; (1900) 2,886.

Woodmen of America, Fraternity of Modern, a fraternal and beneficial order founded in 1883. It has 6,000 local camps and 725,000 members. Since its organization it has disbursed over \$32,000,000 in benefits.

Woodmen of the World, a fraternal and beneficial society founded in 1891. There are two organizations in the United States, the Southern and Pacific, and another order in Canada. In 1903 the Southern order had an income of \$2,739,262; benefits paid \$1,939,572; amount of insurance in force \$65,349,000. The Pacific order had an income in 1903 of \$1,281,012; benefits paid \$845,500, and amount of insurance in force \$37,660,200.

Woodpecker, a bird of the family *Picidae*, one of the most sharply defined families of birds which, with the related *Picumnidae* and *Tyrnidae*, form the very natural order *Pici*. These birds have a unique type of bony palate

(saurognathous) especially characterized by the separation of the vomer into a pair of splint-bones; the fourth toe is reversed permanently so that it forms a pair with the hallux, which, however, is occasionally absent; and there are numerous other anatomical peculiarities. In addition the *Picidae* are distinguished by the acute, rigid and bristly character of the tips of the five well-developed pairs of tail-quills, the outer or sixth pair being rudimentary. In typical woodpeckers the head is large, the neck slender but very powerful, the bill stout, straight, chisel-pointed, and often strengthened by longitudinal ridges, the nostrils protected by a thick screen of bristly feathers, and the feet very powerful, with short stout tarsi, strongly hooked claws and rough scales. The tongue is remarkably well developed, being slender and flexible, with a barbed horny tip in most cases, and the horns extended upward over the head into the orbit or even penetrating into the upper mandible; and suitably provided with muscles for projecting it far beyond the tip of the bill. This arrangement is of the greatest value in enabling these birds to explore deep recesses for insects, and even to drag larvae from their burrows by means of the barbed tip and the adhesive secretion which the tongue receives from the greatly developed salivary glands.

The woodpeckers are a large group, 45 genera and 350 species having been enumerated in 1890. Except Australia, Madagascar, and certain groups of the Polynesian Islands they inhabit the forest-clad regions of the entire globe. By reason of their peculiar mode of life the great majority of species are confined to woodland districts, and they range from the seashore to the mountain heights. Although chiefly insectivorous, the peculiar source of their food, which consists to a great extent of the long-lived wood-boring larvae, makes them largely independent of seasons, and being hardy birds they are, with some exceptions, little migratory and are equally at home in far northern and tropical forests. However, possibly in correlation with the more numerous and larger wood-borers of the warm regions, they there reach the largest size and greatest numerical development. A few woodpeckers, like *Colaptes* (see FLICKER), robin-like, search for worms and insects on the ground, and these have weaker, slightly curved rounded bills, and smaller heads. Some as *Sphyrapicus* and its allies, drill the outer bark of rosaceous trees and lap the flowing sap with their bristle-brushed tongues or, like the red-head woodpecker, peck the ripest apples, green corn, and other sweet and succulent vegetables. But the great majority are strictly insectivorous and perform an invaluable service to human kind by their enormous destruction of a class of destructive insects which is largely beyond artificial attack. With the possible exception of the yellow-bellied woodpecker (*Sphyrapicus varius*), which may be considered doubtful, every species of woodpecker inhabiting the eastern United States is decidedly beneficial. In searching for insects woodpeckers usually begin at the very base of a tree trunk, move spirally upward supported by their strong feet and bracket-like tail, peering into every crevice, pausing occasionally to tap the bark and remain in an attitude of apparent intense listening, and move on. From time to time they peck the

WOODPECKER

bark with hammer-like blows delivered with intense energy, which make the chips fly rapidly and soon expose the larva whose presence within had apparently been detected by the bird's keen sense of hearing. As soon as one tree is sufficiently explored they go to another, but often spend a long time searching and drilling a decayed limb or stump much infested with insects. Woodpeckers have a very characteristic undulating or galloping flight which is seldom much protracted. Their nests are in holes drilled by themselves first horizontally then vertically downward and chambered in the usually partially decayed limb or hole of a tree or some suitable substitute. The eggs are always white with a highly polished porcelain-like surface, are usually numerous, and are deposited on a few woodchips at the bottom of the excavation. Woodpeckers are unmusical, their nuptial song being a loud harsh rattling cry or laugh, combined with a loud drumming on resonant branches. Except during the nesting season they are usually silent and solitary birds.

About one half of the known woodpeckers are American and 8 genera and 30 species and sub-species enter the United States, a number of racial forms being confined to the extreme Southwest. As their habits conform pretty closely to the account just given, only a few representative forms need be mentioned. The primate and crowning glory of our species is the magnificent ivory-billed woodpecker (*Campylurus principalis*), the embodiment of all the highest attributes of woodpecker life and structure. (See IVORY-BILL.) A smaller, duller colored, but generally close counterpart of the ivory-bill is the pileated woodpecker (*Copileatus pileatus*), of similar habits and only less quickly affected by the destructive agencies of man. Its original range, however, was much wider, but it is now a generally very rare and wary inhabitant of the deep woods. It is about 17 inches long, the bill is black and the fourth toe is peculiar in being much shorter than the hallux. *Dryobates* includes numerous species of small and moderate size with the plumage variously striped and spotted with black and white, the males with a red head-patch which the females lack. Very familiar nearly resident species of the wood lot and orchard are the little downy and the larger hairy woodpeckers (*D. pubescens* and *D. villosus*). A more southern and woodland species is *D. borealis*, the red-cockaded woodpecker, while the West has *D. scalaris*, *D. nuttallii*, and *D. arizonæ*. *Xenopicus* contains the noteworthy *X. albolarvatus* which has a completely white head, while *Picoides* is still more noteworthy in the entire absence of the hallux. Two or three species of the three-toed woodpeckers (*P. arcticus*, *P. americanus*, etc.) inhabit the northern parts and western mountains of North America, and others occur in Eurasia. Besides the much divided black and white the plumage shows some yellow and brown. The remaining North American species are less typical in structure and habits. First of them is the handsome and well-known red-headed woodpecker (*Melanerpes erythrocephalus*), locally a common bird among old timber everywhere east of the Rocky Mountains, except in New England. Southward it is resident, northward migratory, and more a vegetarian than most woodpeckers, eating, besides insects, which it sometimes catches flying, nuts, berries,

green corn, and fruits, in search of which it haunts the orchard. The California woodpecker (*M. formicivorus*), as its name indicates, finds ants a favorite article of diet, but also eats fruits, nuts, and acorns, and has a remarkable habit of storing vast quantities of the latter in chinks and holes, often completely studding the boles of tall trees with acorns wedged in singly and sometimes using the space behind the cornices of houses for storage. Much speculation has been indulged in concerning this habit, but the fact is that these birds are migratory and but few of the acorns or the contained grubs thus stored are ever utilized for food. The eastern red-head stores up acorns less regularly. This genus also includes three other western species and the red-bellied woodpecker (*M. carolinus*) chiefly of the southeastern United States.

The sap-sucking habit and the peculiar structure of the tongue of *Sphyrapicus* have been alluded to above. The eastern species, the yellow-bellied woodpecker (*S. varius*), is the well-known sap-sucker (q.v.), whose rows of holes completely encircling the trunks of orchard trees are so familiar. This bird is a migrant, breeding only in the northern States and Canada. The plumage is much variegated with black and white, brown, yellow, and red, and is remarkable for its variability with sex, age, and season. In the West are *S. nuchalis*, *S. ruber*, and *S. thyroideus*. Finally, the genus *Colaptes* contains the handsome ground-woodpeckers or flickers (q.v.), which, while retaining much that is picine in structure and habit, in other respects depart widely. They subsist largely on berries, are more or less migratory and in addition to the ordinary woodpecker calls have many others, some of which are clear and musical. Their headquarters are in the southwestern United States and Mexico, where four species occur including the red-shafted flicker (*C. cafer*), and the gilded flicker (*C. chrysoides*). The eastern or yellow-shafted flicker (*Gauratus*) is one of the best known birds whose ubiquity and marked individuality are attested by the great variety of local names which it has received. In the middle Mississippi Valley and westward, where their ranges overlap, numerous examples combining the characters of *C. auratus* or *C. cafer* in every degree and supposed to be hybrids are found.

The Old World woodpeckers for the most part belong to the typical groups of genera, but three-toed woodpeckers are found in Europe and Asia and in the Malayan Islands, the latter being a peculiar crested genus (*Gauropicoides*). A ground woodpecker (*Geocolaptes olivaceus*) of South Africa is gregarious and remarkable from its habit of nesting, kingfisher-like, in holes in banks. The related wrynecks (*Iyngida*), confined to the Old World, have the general aspects of larks, with soft broadly webbed tail feathers, but their feet and other anatomical parts and their habits, as well, are those of the woodpeckers. However, they nest in natural holes in trees or banks and often seek their food on the ground. The *Picumnidae* have short tails with feathers of the ordinary structure. They are mostly diminutive insectivorous birds, chiefly confined to tropical America.

WOODROW — WOODSTOCK

1862); Baird, Brewer and Ridgway, 'Land Birds of North America,' Vol. II. (Boston 1874); Coues, 'Key to North American Birds' (Boston 1903); Beal, 'Food of Woodpeckers,' Department of Agriculture (Washington 1895).

Woodrow, wūd'rō, James, American Presbyterian clergyman and college president: b. Carlisle, England, 30 May 1828. He was graduated from Jefferson College, Canonsburg, Pa., in 1849, subsequently studied at the Lawrence Scientific School at Harvard, and at the University of Heidelberg. He was professor of natural science in Oglethorpe College, Ga., 1853-61, entered the Presbyterian ministry in 1860 and was Perkins professor in the Presbyterian Theological Seminary, Columbia, S. C., 1861-84. From 1891 to 1897 he was president of South Carolina College.

Woodruff, Wilford, American Mormon leader: b. Northington (now Avon), Conn., 1 March 1807; d. Salt Lake City, Utah, 3 Sept. 1898. He adopted the Mormon faith in 1833 and in subsequent years made missionary tours to England, and in the eastern States. He was one of the Mormon emigrants to Salt Lake City; became one of the 12 apostles in 1839; and in 1887 was elected president of the Mormon Church. For 22 years he held a seat in the Utah Legislature.

Woods, Leonard, American Congregational clergyman: b. Princeton, Mass., 19 June 1774; d. Andover, Mass., 24 Aug. 1854. Graduated from Harvard in 1796, he studied theology at Somers, Conn., as a pupil of Dr. Charles Backus, in 1798 was ordained pastor of the church at Newbury, Mass., and upon the establishment of the Andover Theological Seminary in 1808 was made professor of Christian theology there. In 1846 he retired from the active duties of the chair. He was a strict Calvinist, well-versed in metaphysical studies, a clear and vigorous writer, and a champion of the New England theology against Ware, Buckminster, Channing, and other Unitarians. "He is emphatically," says H. P. Smith, "the 'judicious' divine of the later New England theology." He was prominent in the founding of the Temperance Society, the American Tract Society; and the Board of Commissioners of foreign missions. Among his works are: 'Letters to Unitarians' (1820); 'Lectures on the Inspiration of the Scriptures' (1820); 'Memoirs of American Missionaries' (1833); 'Examination of the Doctrine of Perfection' (1841); and 'Lectures on Church Government' (1843).

Woods, William Burnham, American jurist: b. Newark, Ohio, 3 Aug. 1824; d. Washington, D. C., 14 May 1887. He was graduated at Yale in 1845, was admitted to the Ohio bar in 1847 and mayor of his native city 1856-7. In the last named year he was elected to the Ohio legislature and chosen speaker, at the outbreak of the Civil War entered the Union army as lieutenant-colonel of the 76th Ohio regiment; and was promoted brevet major-general. At the close of the war he took up his residence in Alabama, was chosen chancellor of that State in 1868, appointed circuit judge of the 5th District in 1870, and in 1880 became an associate justice of the United States Supreme Court.

Wood's Holl, or **Wood's Hole**, Mass., in the town of Falmouth (q.v.), in Barnstable

County; on Buzzards Bay, and on the New York, New Haven & Hartford railroad. It has a large, deep harbor, and is widely known as the location of a station with a marine laboratory of the United States Fish Commission.

Wood'stock, Canada, a town and port of entry, capital of Carleton County, New Brunswick, on the Saint John River, and at the terminus of two railways, 130 miles northwest of Saint John. It is in the centre of a rich iron ore mining district, and has numerous industrial establishments. Pop. (1901) 3,644.

Woodstock, Canada, a city and port of entry, capital of Oxford County, Ontario, on the river Thames and Cedar Creek, and on the Great Western Railway, 29 miles northeast of London. It is a thriving industrial and commercial centre, is noted for its educational establishments, and is a favorite summer resort. Pop. (1901) 8,833.

Woodstock, Conn., town in Windham County; about 40 miles northeast of Hartford and five miles northwest of Putnam. It contains six villages. The town is in an agricultural and stock-raising region. The chief industrial establishments are creameries and cotton twine factories. It has Woodstock Academy, graded schools, and a public library. Woodstock belonged to Massachusetts when it was incorporated in 1690. In 1749 it was annexed to Connecticut. Pop. (1890) 2,309; (1900) 2,095.

Woodstock, Ill., city, county-seat of McHenry County; on the Chicago & Northwestern railroad; about 50 miles northwest of Chicago and 30 miles east of Rockford. It is in an agricultural and dairying section. It has flour and lumber mills, creamery, pickle, and canning works. The principal public buildings are the county court-house, city-hall, and business blocks. It has six churches, Todd Seminary for boys, a high school, established in 1867, public elementary schools, and a public library. The three banks have a capital of \$85,000, and, in 1903, the deposits amounted to \$637,400. Pop. (1890) 1,683; (1900) 2,502.

Woodstock, Vt., town, county-seat of Windsor County; on the Ottaguechee River, and on the Woodstock railroad; 38 miles south of Montpelier. It is in an agricultural and dairying region, and contains four villages. The chief industrial establishments are butter and cheese factories, sash, door, and blind factories, flour and lumber mills. Other manufactures are hay-rakes, sleighs, wagons, carriages, butter tubs, and cheese boxes. The town has six churches, graded grammar and elementary schools, and the Norman Williams Public Library, founded in 1885. There are two banks; the national bank has a capital of \$150,000. In 1903 the savings bank had deposits amounting to \$1,215,650. Pop. (1890) 1,218; (1900) 1,284.

Woodstock, Va., town, county-seat of Shenandoah County; on the north branch of the Shenandoah River, and on the Baltimore & Ohio railroad; about 95 miles west of Washington, D. C., and 155 miles northwest of Richmond. It was founded in 1762. It is in an agricultural and stock-raising region, and its industries are connected chiefly with farm and dairy products and the marketing of live-stock. It has eight churches, and graded schools for both races. There are (1903) one national bank, one private

WOODSTOCK — WOOL

bank, and one loan and trust company. Pop. (1890) 1,068; (1900) 1,059.

Woodstock, a novel by Sir Walter Scott, published in 1826. It is an English tale of the time of Cromwell; the events occurring in the year 1652, immediately after the battle of Worcester. The scene is laid chiefly in the Royal Park and Manor of Woodstock.

Woodward, Calvin Milton, American educator: b. Fitchburg, Mass., 25 Aug. 1837. He was graduated at Harvard University in 1860; was principal of Brown High School, Newburyport, Mass., 1860-5. During one year of the Civil War he was captain Co. A, 48th Massachusetts Volunteers, serving in Louisiana. In 1865 he was called to the Washington University, Saint Louis; elected professor of mathematics and applied sciences 1870; dean of School of Engineering 1871-96, and founder and director of the Saint Louis Manual Training School since its organization in 1879. Dr. Woodward's service to the cause of education has been marked by great devotion and by equally great success, especially along practical lines. He served as a member of the Saint Louis School Board 1877-9 and again since 1897; regent Missouri State University 1891-7; fellow and vice-president of the American Association for the Advancement of Science 1903 and 1904; president of the Society for the Promotion of Engineering Education; member of the Saint Louis Academy of Science; past president Saint Louis Engineers' Club; was re-elected dean of the School of Engineering and Architecture July 1901. He is well known as a lecturer on Manual Training. Received the degree of Doctor of Philosophy from Washington University in 1883. He has contributed many valuable articles to educational and scientific journals (see article SAINT LOUIS in this encyclopedia) and has written: 'History of the Saint Louis Bridge' (1881); 'The Manual Training-School' (1887); 'Manual Training in Education' (1890); etc.

Woodward, Robert Simpson, American astronomer, physicist and mathematician: b. 21 July 1849 at Rochester, Mich. He was graduated with the degree of C.E. at University of Michigan 1872 and was appointed assistant engineer United States Lake Survey. During 1882-4 he served as assistant astronomer to the United States Transit of Venus Commission; from 1884-90 he was astronomer, geographer and chief geographer to the United States Geological Survey, became assistant in the United States Coast and Geodetic Survey in 1890, and served for three years. In 1893 he was called to the chair of Mechanics, Columbia University; later became professor of Mathematical Physics also, and in 1895 was made dean of the faculty of pure science.

Dr. Woodward was president of the American Mathematical Society 1898-1900, American Association for the Advancement of Science 1900-1, New York Academy of Sciences 1900-2. In 1892 he received the degree of doctor of philosophy from the University of Michigan, and in 1904 the degree of doctor of laws from the University of Wisconsin. Dr. Woodward has published many papers and addresses on astronomy, geodesy, mathematics and other scientific subjects. (See article EARTH in this encyclopedia.) He has written 'Smithsonian

Geographical Tables' (1894); 'Higher Mathematics—a Text Book for Classical and Engineering Colleges' (1896 with Mansfield Merriam); etc.

Woodworth, wüd'wérth, Samuel, American author and editor: b. Scituate, Mass., 13 Jan. 1785; d. New York 9 Dec. 1842. He received a limited education in his native town, and was apprenticed in Boston to Benjamin Russell, editor and publisher of the 'Columbian Centinel.' After the expiration of his indentures he published for a brief period at New Haven, Conn., the weekly 'Relles-Lettres Repository,' engaged in other literary pursuits, in which he continued with more or less success until the close of his life. He was one of the founders in 1823, in conjunction with George P. Morris, of the 'New York Mirror,' from which he withdrew within a year. Among his writings were a number of dramatic pieces, and 'Champions of Freedom' (1816), but his reputation rests principally upon his songs and miscellaneous poems, one of which, 'The Old Oaken Bucket,' obtained a wide popularity. His collected poems were published, with a memoir by G. P. Morris, in 1861.

Woof. See WEAVING.

Wool, wül, John Ellis, American general: b. Newburgh, N. Y., 20 Feb. 1789; d. Troy, N. Y., 10 Nov. 1869. He was in early life proprietor of a bookstore in Troy, and his property being consumed by fire, he turned to the law, but his studies were interrupted by the war with Great Britain in 1812, when he became captain in the 13th infantry. He distinguished himself at Queenstown Heights, Plattsburg, and Beekmantown, and in 1816 was appointed inspector-general of the northern division; in 1818 lieutenant-colonel; in 1821 inspector-general of the whole army; and in 1826 brevet brigadier-general for 10 years' faithful service. In 1832 the government sent him to Europe to examine the military systems of some of the principal nations. In 1836 he was charged with removing the Cherokee Indians to Arkansas; and in 1838, during the Canadian difficulties, made a reconnaissance through the wilds of northern Maine, with a view to the defense of the frontier. He was appointed brigadier-general, 25 June 1841, and at the commencement of the Mexican War was ordered to the West to organize the volunteers, 30 May 1846, and in less than six weeks despatched to the seat of war 12,000 troops fully armed and equipped. He selected the ground on which was fought the battle of Buena Vista 23 Feb. 1847, commanded in the early part of the action, and for his conduct on this occasion was brevetted a major-general in 1848. After his return home in July 1848, he commanded the eastern military division, with headquarters at Troy, until October 1853, when he was placed at the head of the department of the East, with his headquarters at Baltimore. From 1854 to 1857 he was in command of the department of the Pacific and of the Eastern department again 1857-60. When civil war was imminent toward the close of 1860, he offered his services to the government, and after the attack upon Fort Sumter went to New York to organize, equip, and send to Washington the first regiments of volunteers. In August he was sent to Fortress Monroe as commander of the department of Virginia, and from that post led an expedition

CALVIN MILTON WOODWARD.

WOOL-GRASS — WOOLF

which occupied Norfolk, 10 May 1862. He was promoted to be full major-general in the regular army, 16 May 1862 and the next year was placed on the retired list.

Wool-grass, a rush. See *SCIRPUS*.

Wool, Manufacture of. Among the ancients wool was the staple material for clothing and was used before either flax or cotton. The ancient Greeks manufactured wool into goods of special excellence. The making of woollen cloth was introduced into England by the Romans. In the 18th century Yorkshire became the great wool centre of Great Britain.

Modern Process.—In making woollen cloth the essential processes, as carried on in modern factories, are: (1) the stapling of the raw wool. In this process the stapler or sorter works at a table covered with wire netting, through which the dirt falls while the various qualities of wool are being separated. The wool is then ready to be put through the (2) scouring machine, where it passes on an endless apron into an oblong vat, which contains a steaming soapy solution. Here it is carried forward gently by means of rakes until it is thoroughly soaked and cleansed. After this it is taken to the (3) drying framework of wire netting, under which are situated steam-heated pipes. A fan-blast drives the heated air upward through the wet wool, which lies on the wire netting, until it is all equally

form of yarn, is now fit for (8) weaving into woollen cloth. (See *WEAVING*.) When it is taken out of the loom the cloth is washed, to free it from oil and other impurities, and also beaten while it lies in the water by wooden hammers moved by machinery, while it is again dyed if found necessary. After it has been scoured in water mixed with fuller's earth, the cloth undergoes a process of (9) teasing and shearing (see *TEASEL*), in which the pile or nap is first raised, and then cut to the proper length by machines. When this is done it is (10) steamed and pressed between polished iron plates in a hydraulic press.

Worsted.—In the manufacture of worsted yarn the long-staple wool fibres are brought as far as possible into a parallel condition by processes called gilling and combing. The wool, in a damp condition, is passed through a series of "gill boxes," in which steel gills or combs separate and straighten the fibres until, from the last box, it issues in a long sliver. In this condition it is run through a delicate combing machine. From the combing machine it is delivered in the condition of a fine sliver technically called top, and after being further attenuated by a process of roving the thread is spun into yarn on what is called a throstle-frame.

Statistics.—The United States census reports of wool manufacture, by decades, from 1870 to 1900, show the following:

	1870	1880	1890	1900
No. of factories.....	3,208	2,330	1,693	1,414
Capital	\$121,451,059	\$143,512,278	\$245,866,743	\$310,179,749
Value of product.....	199,257,262	238,035,686	270,527,511	296,990,484

dried. When necessary this is the point in the process when it is "dyed in the wool." It is then ready for the (4) willeying or teasing machine, which consists of a revolving drum furnished with hooked teeth, close above which are set cylinders with hooked teeth moving in a contrary direction. The wool is fed in upon the drum, which whirls with great speed; and between the two sets of teeth working in opposite directions it is disentangled, torn, and cast out in fine, free fibres. With some classes of wool it is also necessary, at this stage, to remove suds and burrs by steeping them in a solution of sulphuric acid, or passing them through a burring machine, by which the burrs are extracted. The wool is now dry and brittle; and before submitting it to the process (5) of carding, it is sprinkled with oil and well beaten with staves in order to give it suppleness. This process of carding is accomplished by a series of three delicate and complex machines called a scribbler, an intermediate, and a finisher. These machines have various intricate cylinders and rollers, studded with teeth and working in opposite directions, over which the wool is passed until it is torn, interblended, and finally delivered from the finisher in a continuous flat lap. It is then cut into strips and passed (6) to the condensing machine, which rubs the strip into a soft, loose cord or sliver technically called a "slubbing." The wool is now ready for (7) spinning into yarn, and this is accomplished in a wool-spinning mule, which draws and twists the sliver into the required thinness, the process being essentially the same as in cotton-spinning. The wool, which has thus been brought into the

In total value of products Massachusetts led in 1900, with a product valued at \$81,041,537; Pennsylvania was second with \$71,878,503. No other State approached these two. Rhode Island was third in rank, with a product somewhat less than half that of Massachusetts, followed by New York, with a product not quite half that of Pennsylvania. New Jersey, Maine, and Connecticut were very close together, with but little over \$1,000,000 difference in the value of their products. New Hampshire was eighth, with products of \$7,624,062. Vermont had \$2,572,646, and Tennessee \$1,517,194. These 10 States were the producers of nearly 70 per cent of the total wool manufactured in the United States. The total amount paid in wages in 1900 was \$57,933,817, divided as follows: To men, \$36,412,872; to women, \$19,549,423; to children, \$1,971,522. In 1890 the total amount was \$54,339,775, of which \$33,702,231 was paid to men, \$18,883,174 to women, and \$1,754,370 to children.

Wool-sorters' Disease. See *ANTHRAX*.

Woolens Bill, in American history, a tariff bill introduced into Congress in 1816. It provided for the general reduction of tariff on woollen and cotton goods. The bill was supported by Clay, Calhoun, and Lowndes, and opposed by Daniel Webster and John Randolph. The bill passed the House by a vote of 88 to 54 and the Senate by 25 to 7. It became a law 27 April 1816. See *TARIFF*; *UNITED STATES — TARIFF IN THE*.

Woolf, wulf, **Albert Edward**, American chemist and inventor, son of Edward Woolf (q.v.). He was educated in the College of the

City of New York. Among his discoveries are the antiseptic and medical properties of seawater combined with the electric current; the use of peroxide of hydrogen to bleach black ostrich feathers white, and also its employment as an antiseptic.

Woolf, Benjamin Edward, son of Edward Woolf (q.v.), American dramatist and musician: b. London 16 Feb. 1836; d. Boston, Mass., 7 Feb. 1901. Coming to New York in childhood with his parents, he early displayed a passion for music and was carefully trained by his father, with such results that in later days he became the leader of orchestras in Boston, Philadelphia, and New Orleans. He settled in Boston, where he was dramatic critic for the 'Saturday Evening Gazette' 1871-93, a post which he quitted for a similar one on the Boston *Herald*. He was an industrial musical composer, writing many overtures, quintets, and trios, besides plays and operettas. His most successful comedy was 'The Mighty Dollar,' while his operetta, 'The Doctor of Alcantara,' was a favorite in its time.

Woolf, Edward, American musician: b. London, England, September 1803; d. New York 14 March 1882. In 1839 he came to New York, where his musical genius was soon recognized not only as teacher and composer, but also as orchestral leader. His excessive shyness and modesty kept him in the background and prevented his securing the position intellectually his due. He was the author of many novels that appeared in the early years of 'The Jewish Messenger,' such as 'The Jewess of Toledo'; 'The Vicomte D'Arblay'; and 'Judith of Bohemia.'

Woolf, Michael Angelo, American artist, son of Edward Woolf (q.v.): b. London, England, 1837; d. New York 4 March 1899. Brought to New York in his babyhood, he early evinced a love for art and studied wood engraving for seven years. In the early sixties he was an illustrator for 'Yankee Notions,' then a popular journal, and was on the stage for a time, returning finally to art, and going to Munich and Paris to study painting. On resuming his work in New York, his first drawing of a ragged newsboy for a paper called 'The Pick' elicited such comment that he began the series of street caricatures on which rests his fame. These reveal his humanity as well as artistic insight.

Woolf, Philip, American physician and novelist, son of Edward Woolf (q.v.): b. New York 7 Feb. 1848; d. 1903. He was graduated from the Medical College of Bellevue Hospital in 1868, and was for some time editor of the Boston 'Saturday Evening Gazette.' His novels include: 'Who is Guilty?' 'The Trail of the Serpent'; 'Satan's Mirror'; 'Three Women and a Dead Man'; 'Goldenrod and Aster.'

Woollett, wul'ët, William, English engraver: b. Maidstone, Kent, 1735; d. London 23 May 1785. His family originally came from Holland, and he was instructed in his art by an engraver named John Tinney. He engraved historical subjects and portraits, but was most successful in landscapes, in which he exhibited such varied excellences as, in the opinion of Longhi, to entitle him to be considered 'the marvel and the example for all contemporary engravers and for those of the present time.'

His foregrounds are vigorous and solid, and his aerial perspective wonderfully clear and true, while he treats water, the crux of the engraver, with supreme success. His masterpieces are his 'Niobe' and other plates after pictures by Richard Wilson, and the 'Death of Wolfe' and the 'Battle of La Hogue' after West. He was the first who conceived and embodied in practice the idea of uniting in one plate the three methods of engraving, by aqua fortis, the burin, and the dry needle. His genuine plates are estimated at 123, but impressions are exceedingly rare and valuable, as he permitted no imperfect prints to be struck off. Consult Fagan, 'Catalogue Raisonné of the Engraved Works of William Woollett' (1885).

Woolley, wul'i, Celia Parker, American Unitarian minister: b. Toledo, Ohio, 14 June 1848. Graduated from Coldwater Female Seminary, in 1868 she was married to J. H. Woolley, and in 1876 removed to Chicago. She was pastor of the Unitarian Church, Geneva, Ill., for three years, and of the Independent Liberal Church, Chicago (1896-8), since when she has been active as a lecturer and in the work of women's clubs. She is the author of the novels 'Love and Theology' (1887), republished as 'Rachel Armstrong, or, Love and Theology'; 'A Girl Graduate' (1889); 'Roger Hunt' (1893); 'The Western Slope' (1903).

Woolley, John Granville, American prohibitionist: b. Collinsville, Ohio, 15 Feb. 1850. Graduated from the Ohio Wesleyan Seminary in 1871, he was admitted to the bar of the Illinois supreme court in 1873, became city attorney of Paris, Ill., in 1875, and prosecuting attorney in Minneapolis in 1881. At one period addicted to intemperance, he began lecturing against it in 1888, and has lectured to many audiences on this theme at home and abroad. He has been editor of 'The New Voice,' a prohibition organ, since 1899, and was the Presidential candidate for the Prohibition party in 1900, receiving a vote of 208,914. He has published: 'Seed'; 'The Sower'; 'Civilization by Faith'; 'The Christian Citizen'; 'The Lion Hunter.'

Woolman, John, American Quaker preacher: b. Northampton, Burlington County, N. J., August 1720; d. York, England, 7 Oct. 1772. In 1741 he became a speaker in the meetings of the Society of Friends. He was at this time a bookkeeper in a mercantile house, but subsequently learned the tailor's trade. In 1746, in company with Isaac Andrews, he made his first itinerant tour in some of the back settlements of Virginia, and from that time continued at intervals to visit the societies of Friends in the different portions of the colonies. In 1763 he visited the Indians on the Susquehanna. He both spoke and wrote much against slavery. His best-known work is the posthumous 'Journal of John Woolman's Life and Travels in the Service of the Gospel' (1775), which Whittier edited, with an introduction, in 1871. Woolman's simple and candid style has been highly praised by Charles Lamb, Crabb Robinson, and others. Among his other writings are: 'Some Considerations on the Keeping of Negroes' (1753; Part II., 1762); 'Considerations' on various topics (1768); and 'Serious Considerations' (1773). In 1774-5 a collective edition of his works appeared. Consult Whittier's sketch in the above-mentioned edition of the 'Journal.'

WOOLNER—WOOLSTON

Woolner, Thomas, English sculptor and poet: b. Hadleigh, Suffolk, 17 Dec. 1825; d. London 7 Oct. 1892. At 12 he was placed in the studio of William Behnes, in 1842 entered the schools of the Royal Academy, and in the following year his first work, 'Eleanor Sucking the Poison from the Arm of Prince Edward,' was exhibited. His first work to attract attention was 'The Death of Boadicea' (1844), and this success was followed by 'Alastor' (1846); 'Puck' (1847); 'Tania and Her Indian Boy' (1848); and 'Eros and Euphrosyne' (1848). About 1850 he was associated with Rossetti and the other artists who formed the "Pre-Raphaelite Brotherhood," in founding the short-lived but famous periodical called 'The Germ.' His contributions, which were in verse, were collected and published, with additions, under the name 'My Beautiful Lady' (1863). Woolner visited Australia in 1852, and one of his first works on his return was a life-size statue of Lord Bacon for the Oxford Museum. Among his more important works are: 'Elaine with the Shield of Sir Lancelot'; 'In Memoriam' (1870); 'Guinevere' (1872); 'Lady Godiva' (1876); portrait busts of Carlyle, Tennyson, Darwin, Newman, Gladstone, Kingsley, and Dickens, and statues of Lord Macaulay for Trinity College, Cambridge (1866), Sir Bartle Frere for Bombay (1872), Dr. Whewell for Trinity College, Cambridge (1873), Lord Lawrence for Calcutta (1875), J. S. Mill for the Thames Embankment (1878), Captain Cook for Sydney (1879), Sir Stamford Raffles for Singapore (1887), and Lord Palmerston for Palace Yard, Westminster. He became a Royal Academician in 1874, and for a time was professor of sculpture in the Academy. His fame as a sculptor has overshadowed his reputation as a poet, but 'Pygmalion' (1881), 'Silenus' (1884), 'Tiresias' (1886), and 'Poems' (1887) give him honorable rank among the minor poets of his time. Consult Garnett, in 'Dictionary of National Biography.'

Woolsey, wul'si, Sarah Chauncey ("SUSAN COOLIDGE"), American author, niece of T. D. Woolsey (q.v.): b. Cleveland, Ohio, 1845. As "Susan Coolidge" she has been a popular writer for children, but has also written for their elders 'Verses' (1880); 'A Short History of Philadelphia' (1887). Among her books for young people may be cited: 'The New Year's Bargain' (1871); 'What Katy Did' (1872); 'A Guernsey Lily' (1881); 'A Little Country Girl' (1885). She has also edited 'The Diary and Letters of Mrs. Deleaney' (1878); 'The Diary and Letters of Frances Burney, Madame D'Arblay' (1880).

Woolsey, Theodore Dwight, American college president and scholar: b. New York 31 Oct. 1801; d. New Haven, Conn., 1 July 1889. He was graduated at Yale College in 1820; studied law in Philadelphia and theology at Princeton, was tutor at Yale 1823-5, and was licensed to preach in 1825. After studying abroad (1827-30) he was professor of Greek at Yale 1831-46, and president of the college 1846-71. In 1871-81 he was chairman of the American company of revisers of the New Testament. Besides editions of Greek plays—the 'Alcestis' of Euripides (1833), the 'Antigone' (1835), and 'Electra' (1837) of Sophocles, the 'Prometheus' of Plato (1837), as well as the 'Gor-

gias' of Plato (1842)—his works include an 'Introduction to the Study of International Law' (1860, 5th ed., 1879); 'Essays on Divorce and Divorce Legislation' (1869); 'Political Science; or the State Theoretically and Practically Considered' (1877); 'Religion of the Past and of the Future' (1871); 'Communism and Socialism' (1880). He also edited Lieber's 'Civil Liberty and Self-Government' (1871) and his 'Manual of Political Ethics' (1871). He was one of the founders of the 'New Englander,' to which he often contributed, one of the regents of the Smithsonian Institution, and at one period president of the American Oriental Association.

Woolsey, Theodore Salisbury, American professor of international law, son of T. D. Woolsey (q.v.): b. New Haven, Conn., 22 Oct. 1852. He was graduated from Yale in 1872, became instructor in international law at Yale in 1877, and since 1878 has been full professor there. He has published 'America's Foreign Policy' (1872); and edited Pomeroy's 'International Law' (1886); and the 6th edition of Woolsey's 'International Law' (1891). He was also associate editor of Johnson's 'Universal Cyclopedia' (1892-5).

Woolson, wul'son, Abba Louisa Gould, American lecturer and author: b. Windham, Maine, 30 April 1838. She has lectured extensively on literary, social, historical, and dramatic subjects, and was the founder and honorary president of the Castilian Club of Boston. She has published 'Women in American Society' (1873); 'Browsing among Books' (1881); 'George Eliot and Her Heroines' (1886); 'Dress Reform' (1874).

Woolson, Constance Fenimore, American author: b. Claremont, N. H., 5 March 1848; d. Venice, Italy, 24 Jan. 1894. Educated in Cleveland, Ohio, and New York, she resided in Ohio, then in Florida and other Southern States, and finally abroad, chiefly in Italy. Her first story published in a secular magazine—contributions to Episcopalian periodicals had preceded it—was 'The Happy Valley' in 'Harper's Monthly' (1870). In this much of her subsequent work appeared. Many poems were printed from time to time, but these were never collected. Her reputation was based on works in fiction, the volumes being 'The Old Stone House' (1873); 'Castle Nowhere: Lake Country Sketches' (1875); 'Rodman the Keeper' (1880); 'Anne' (1882); 'For the Major' (1883); 'East Angels' (1886); 'Jupiter Lights' (1889); 'Horace Chase' (1894); and 'The Front Yard, and Other Italian Stories' (1895). Their background is generally American, preferably the Lake region or the South; and when it shifts to Europe is less skilfully treated. They were highly praised by Stedman and other critics for equal freedom in presenting diverse types and conformity to high literary standards.

Woolston, wul'ston, Thomas, English deist: b. Northampton 1669; d. London 21 Jan. 1731. He was educated at Sidney Sussex College, Cambridge, became a fellow, and took orders in the English Church. He made a careful study of Origen and in 1705 published the 'Old Apology for the Truth of the Christian Religion against the Jews and Gentiles Revived.' He maintained in this work that Moses was an allegorical personage, and his history typical

WOOLWICH — WOOSTER

of that of Christ. In 1721 he published 'The Moderator between the Infidel and the Apostate,' dialogues tending to show that the Gospel miracles by themselves could not prove Christ to be the Messiah. This work occasioned great scandal, and it was only through the intervention of Whiston that the author escaped a prosecution. In 1721 his college deprived him of his fellowship. The views set forth in his last work Woolston developed more fully in 'The Moderator between an Infidel and an Apostate' (1725). His famous series of six 'Discourses on the Miracles of Christ' appeared 1727-9, with two 'Defences' in 1729 and 1730. He was indicted for blasphemy in consequence of the publication of this work and was imprisoned. His collected works with 'Life' appeared in five volumes (1833).

Woolwich, wŭl'ich, England, a former town of Kent, now a metropolitan borough of London, on the right bank of the Thames, eight miles below London Bridge. It has many ancient, together with a number of handsome modern houses, an old church (restored 1894), other places of worship, a town-hall, and several charitable endowments. It owes its importance to the royal arsenal, which occupies an area of above 350 acres, and is one of the most complete and magnificent establishments of the kind in the world, with extensive forges, foundries, and workshops of various kinds in which the newest types of machinery are employed for the manufacture of immense quantities of warlike stores which are kept in suitable magazines and storehouses. In the Rotunda there is a fine historical collection of arms and other interesting objects. A large garrison is stationed at Woolwich, which is the headquarters of the royal artillery; and there are various barracks, a military and a naval hospital, etc. On the edge of Woolwich Common, a fine large open area, are the handsome buildings of the Royal Military Academy (see MILITARY SCHOOLS); and the Royal Ordnance College is also at Woolwich. At North Woolwich, on the opposite side of the river, to which runs a free steam ferry, many houses and extensive factories, especially of telegraph cables, have recently sprung up. Pop. of metropolitan borough (1901) 117,165.

Woonsocket, woon-sŏk'ĕt, R. I., city in Providence County; on the Blackstone River, and on the New York, New Haven & Hartford (two branches) railroad; about 15 miles northwest of Providence and 37 miles southwest of Boston. It has electric lines extending to all the near-by towns. The river here is spanned by a bridge which cost originally \$300,000. It has three parks and the county fair grounds. It is a well-known manufacturing city. In 1900 (government census) there were 242 manufacturing establishments, capitalized for \$14,279,361, and in which were 8,093 wage-earners, to whom were paid annually \$3,080,280. The total cost of raw material used annually was \$7,563,204 and the value of the finished products was \$15,627,539. The chief manufactures were cotton goods, foundry and machine-shop products, worsted goods, and hosiery and knit goods, each of which had an annual output valued at more than \$1,000,000. Other manufactures are carved and turned wood, wagons, carriages, woolen goods, machinery, and furniture.

The educational institutions are a high school,

established in 1857; Sacred Heart College (R. C.), for young men; Saint Ann's Academy (R. C.) for girls and young women, public and parish schools, the Harris Institute Library containing about 16,000 volumes. There are nine banks and trust companies. In 1903 the Woonsocket Institute for Savings had deposits amounting to \$4,800,000; and the Producers Saving Bank had \$1,415,570. The city owns and operates the water-works.

Woonsocket is a consolidation of several factory villages. The first village called Woonsocket is not included in the limits of the present city. The city was set off in 1867 from the town of Cumberland; in 1871 a part of Smithfield was annexed, and 13 June 1888 the city was incorporated. Pop. (1890) 20,830; (1900) 28,204; (1903, est., Gov. Report) 30,415. Consult Richardson, 'History of Woonsocket.'

Woorari, or **Woorara**. See CURARI.

Wooster, wŭs'tĕr, David, American Revolutionary general: b. Stratford, Conn., 2 March 1710; d. Danbury, Conn., 2 May 1777. He was graduated at Yale College in 1738; and in 1739, when the war broke out between England and Spain, entered the provincial army as lieutenant, and was subsequently made captain of a vessel built and equipped by the colony for the defense of its coasts. In 1745 he participated in the expedition against Louisburg, and went in command of a cartel ship to England, where he was made a captain in the regular service under Sir William Pepperell. In the French war which ended in 1763 he was commissioned by the governor of Connecticut as colonel, and subsequently as brigadier-general, and served during the whole war. In April 1775 he was one of the members of the assembly of Connecticut who concerted the plan for the seizure of Ticonderoga; and when the continental army was organized he was appointed one of the eight brigadier-generals. He was engaged in the expedition into Canada, where after the death of Gen. Montgomery he for a time held the chief command. He resigned and returned to Connecticut, and was major-general of the militia when Tryon invaded that province for the purpose of destroying the military stores at Danbury. He attacked Tryon's rear guard 27 April 1777, and while rallying his men was mortally wounded. On 17 June Congress voted that a monument should be erected to his memory, but no steps were taken to have the resolution carried into effect, and his neglected grave was not identified until 1854, on 27 April of which year the corner-stone of a monument to his memory was laid, by act of the legislature of Connecticut. The town of Wooster, Ohio, was named in his honor.

Wooster, Ohio, city, county-seat of Wayne County; on the Killbuck Creek, and on the Pennsylvania and the Baltimore & Ohio R.R.'s; about 50 miles southwest of Cleveland. It is in an agricultural and stock-raising region. It has manufactories of flour, furniture, doors, sash, and blinds, boilers, engines, mill-gearing, and brick. There are two national banks having a combined capital of \$200,000, and one private bank. The educational institutions are Wooster University (q.v.), the Ohio Agricultural Experiment Station, a high school, public elementary schools, and two libraries. Pop. (1890) 5,901; (1900) 6,063.

WORCESTER

Worcester, wüs'tér, **Dean Conant**, American educator: b. Thetford, Vt., 1 Oct. 1866. He was graduated at the University of Michigan in 1889, having previously accompanied the Steere scientific expedition to the Philippine Islands in 1887-9. He was instructor in animal morphology at the University of Michigan 1893-6, becoming assistant professor in the last-named year. In 1890-2 he again traveled in the Philippines, with F. S. Bourns, in a tour known as 'The Menage Scientific Expedition,' and in January 1899 was appointed one of the United States commissioners to the islands to investigate and report on conditions there. He has published: 'Preliminary Notes on Birds and Mammals collected by the Menage Scientific Expedition to the Philippine Islands' (1894); 'Contributions to Philippine Ornithology' (1898); 'The Philippine Islands and their People' (1898).

Worcester, Edward Somerset, 2D MARQUIS OF, English inventor: b. Raglan Castle, Monmouthshire, 1601; d. 3 April 1667. He engaged in the service of Charles I. during the civil war, and was employed by the king to act for him in Ireland; but when his errand was discovered he was treated with duplicity by Charles, and retired to France in 1648. Returning to England in 1652 he was imprisoned in the Tower 1652-4, and his estates were sequestered, but after the Restoration he recovered most of these. He afterward spent his time in retirement, and in the cultivation of natural philosophy and mechanics. In 1663 he published a book entitled 'Century of the Names and Scantlings of Inventions as I can call to mind to have been Tried and Perfected,' in which he first gave a description of the uses and effects of an engine for "driving up water by fire"; and afterward published a small pamphlet, called 'An Exact and True Definition of the most Stupendous Water-commanding Engine, invented by the Marquess of Worcester.' In neither of these does he give any statement of the mode of constructing his engine; but, from his description and account of its effects, it may be inferred that its action depended on the condensation as well as the elastic force of the steam. (See STEAM-ENGINE.) Consult: Dirck, 'Life, Times, and Scientific Labors of the Second Marquis of Worcester' (1865); Dirck, 'Worcesteriana' (1865).

Worcester, Edwin Dean, American railway official: b. Albany, N. Y., 19 Nov. 1828; d. New York 13 June 1904. He studied law, and followed various pursuits, but entered railroad-ing in 1853, when he became a member of the accounting department of the New York Central railway. He laid out, opened, and managed the books of this company when there were no precedents in the United States for the organization of large railways, and the present accounting system of railways in this country is largely the development of his work. Subsequently he became successively treasurer and secretary of the company; in 1873 secretary and treasurer of the Lake Shore & Michigan Southern, in 1883 its vice-president; and in 1878 secretary of the Michigan Central, in 1883 its vice-president. From 1883 he was also secretary, or treasurer, or both, in 15 other companies.

Worcester, Joseph Emerson, American lexicographer: b. Bedford, N. H., 24 Aug. 1784;

d. Cambridge, Mass., 27 Oct. 1865. He was graduated from Yale in 1811, and from 1819 resided in Cambridge, Mass., busily preparing and publishing books. Among his earlier works, compiled with much accuracy and excellent condensation, were: 'A Geographical Dictionary' (1817), of which an enlarged edition appeared in 1823; a 'Gazetteer of the United States' (1818); and 'Outlines of Scripture Geography' (1828). His first effort in English lexicography was an edition of 'Johnson's English Dictionary, as Improved by Todd and Abridged by Chalmers, with Walker's Pronouncing Dictionary Combined' (1828). In 1829 he prepared an abridgment of Webster's 'American Dictionary'; and in 1830 published his 'Comprehensive Pronouncing and Explanatory Dictionary.' After collecting philological works in Europe in 1830-1, he edited the 'American Almanac' in 1831-43, and in 1846 published the 'Universal and Critical Dictionary of the English Language.' His chief work, 'A Dictionary of the English Language,' appeared in 1860, being the first work of the sort to employ illustrations. For this many collaborators were employed, particularly for the definition of technical terms. The chief point of difference between the work of Webster and that of Worcester was that the latter sought to present the language as it was, while Webster endeavored to exhibit it improved as he thought it should be. Essentially the same scheme, that of Worcester, is now observed by each. By many Worcester has been preferred to Webster for its pronunciations.

Worcester, Noah, American theologian: b. Hollis, N. H., 25 Nov. 1758; d. Brighton, Mass., 31 Oct. 1837. He was a fifer in the Continental army in 1775, and entered the service again for a short time as fife-major in 1777. In 1786 he was licensed to preach by a Congregational association, and in 1787 ordained pastor of the church in Thornton, N. H., where he had held local offices and been elected representative to the General Court. In 1802 he was employed as the first missionary of the New Hampshire Missionary Society, and in that capacity traveled and preached widely in the northern portion of the State. In 1810 he removed to Salisbury, and took charge of the congregation, and in 1813 settled at Brighton, Mass. His work on the doctrine of the Trinity, entitled 'Bible News of the Father, Son, and Holy Ghost' (1810), soon became the subject of severe animadversion, the Hopkinton association, of which he was a member, passing a formal sentence of condemnation against the book. From 1813 to 1818 he edited 'The Christian Disciple,' a periodical published in Boston, and in 1814 published his tract, 'A Solemn Review of the Custom of War,' once well known, and translated into several languages. Shortly after this the Massachusetts peace society was formed, and in 1819 he commenced 'The Friend of Peace,' which continued in quarterly numbers for 10 years, nearly the whole of it being written by himself. In 1829 he published 'The Atoning Sacrifice a Display of Love, not of Wrath'; in 1831, 'The Causes and Evils of Contention among Christians'; and in 1833, 'Last Thoughts on Important Subjects.' Among his further writings is a 'Respectful Address to the Trinitarian Clergy' (1812). Consult the 'Memoirs' by Ware (1844).

WORCESTER

Worcester, England, (1) A city, the capital of Worcestershire, situated in a beautiful vale on the eastern bank of the Severn, 103 miles north-northwest of London. The cathedral is a noble specimen of Gothic simplicity. It was first erected by Ethelred, king of Mercia, in 680, and a later edifice was burned down and rebuilt in the beginning of the 13th century. It was restored in 1857-74. It is 394 feet long, 78 feet wide, and 68 feet high, and the tower, which rises from the intersection of the nave and aisles to the altitude of 170 feet, is ornamented at the corners by lofty pinnacles. It contains many handsome monuments and sculptures. There are about 20 other handsome places of worship, such as Holy Trinity, Saint Nicholas, Saint Andrews, Saint Helens, etc. Among other buildings are the shire-hall, guildhall, Victoria Institute (library, museum, etc.), corn-exchange, the hop and fruit market, museum of natural history, two grammar-schools, several charitable institutions, etc. Worcester is the chief seat of the English leather glove trade, has celebrated porcelain-works, "Worcester sauce" works, vinegar-works, chemical and manure works, foundries, railway signal works, carriage factories, and other works. Its trade in hops is extensive. There are municipal electric lighting works, and a service of electric trams. The most remarkable event here was the victory of the English army, under Cromwell, over the Scotch in the cause of Charles II., in 1651. Pop. (1901) 46,623. (2) An inland county bounded on the north by Salop and Stafford, on the west by Hereford, on the south by Gloucester, and on the east by Warwick; with some separated portions, enclosed by the counties of Gloucester and Warwick. The area is 739.7 square miles. The surface, generally level or gently undulating, has some extensive and beautiful vales, the principal of which, that of the Severn, is 30 miles long, and one quarter to a mile broad. On the southwest are the fine Malvern Hills, the loftiest of which is 1,444 feet above sea-level. The soil, composed chiefly of clay and loam, is of great fertility. The principal crops are wheat, barley, oats, beans, pease, turnips, and hops. The orchards are celebrated for their apples and cider. The vales consist of meadows and rich pastures. The sheep are of the Leicester breed. Coal is found in the north and northwest; the brine springs at Droitwich and Stoke Prior supply immense quantities of salt; iron is found with the coal, and the manufacture of iron and steel, and of hardware, is extensive; carpets and rugs are made at Kidderminster; and porcelain, gloves, and other articles at Worcester. Pop. (1901) 358,356.

Worcester, Mass., city, one of the county-seats of Worcester County; on the Blackstone River, and on the New York, N. H. & H., the Boston & M., and the New York Central R.R.'s; 44 miles west of Boston and 45 miles northwest of Providence. Electric railways extend to all the near-by towns and to Boston. The city was begun in a valley, but it now occupies a number of the surrounding hills; the average elevation above sea-level is 500 feet.

Industries.—Worcester is noted for the number and variety of its manufacturing establishments. In 1900 (government census) the city had 1,071 manufactories, capitalized for \$42,966,743, and employing 1,430 officials and clerks, to

whom were paid annually \$1,791,000, and 25,593 wage-earners to whom were paid annually \$12,894,784. The raw material used each year cost \$26,666,176, and the value of the finished products was \$53,348,783. The 90 foundries and machine-shops had an annual output valued at \$8,492,686. The 11 boot and shoe factories had productions valued at \$1,610,605; the products of the 5 envelope establishments amounted to \$1,150,802; the 11 wirework factories, including wire rope and cable, produced annually goods to the amount of \$1,531,047; and the 11 woolen goods mills had an annual output valued at \$1,553,297. There were 34 additional industries, each one of which had finished products amounting annually to over \$100,000. Some of these industries are the manufacturing of worsted goods, machinery, printing and publishing products, musical instruments, marble and stone products, lumber products, leather goods, women's clothing (factory products), men's clothing (factory products), and food products.

Buildings and Municipal Improvements.—The principal public buildings are the government building, court-house, city-hall, State armory, Mechanics' Hall, the Young Men's Christian Association and the Young Women's Christian Association buildings, buildings of the Women's Clubs, the State Mutual Assurance Company, several charitable institutions, the religious and educational institutions, and the Union Station. The area is 32 square miles, including the hill country and the lakes within the city limits. There are 10 public parks, having a combined area of 400 acres; Lake Park has 110 acres and Elm Park 86 acres. The system of waterworks cost, originally, \$3,670,000; there are about 200 miles of mains. The sewer system covers about 170 miles, and cost \$5,341,534. The city is divided into eight wards, which diverge from the centre of the city like the spokes of a wheel. The principal business streets run north and south.

Churches, Charitable, and Educational Institutions.—There are over 100 church organizations, having about 85 edifices. The denominations rank, according to the number of their buildings, as follows: Congregationalist, 18; Baptist, 16; Methodist Episcopal, 12; Roman Catholic, 12; Protestant Episcopal, 5; Unitarian, 4, and others 1 or 2 each. The hospitals are the Washburn Memorial Hospital, for women and children; the City Hospital, Homœopathic Hospital, Saint Vincent's and Saint Francis' hospitals. Other institutions are the State Insane Asylum, the State Odd Fellows' Home, Saint Ann's Orphan Asylum, Saint Vincent's Home for the Aged, Saint Francis' Home for the Aged, Our Lady of Mercy orphanage, a home for the friendless, and a number of private hospitals. The educational institutions are Clark University, a post-graduate school for original research, opened in 1889; College of the Holy Cross (R. C.), opened in 1843; the Bancroft School; Highland Military Academy (P. E.); Kimball's School for Girls; Saint John's School (R. C.); Worcester Academy; Becker's Business College; Worcester Polytechnic Institute; Hinman's Business College; a State normal school; three public high schools; the classical opened in 1845, the English high school, and the evening high school, public and parish elementary schools, the Free Public Library containing about 140,000 volumes, two antiquarian

WORCESTER—WORDE

societies, historical and literary societies, and several school libraries.

Banks and Finances.—In 1903 Worcester had 16 banks. The exchanges at the United States clearing-house for the year ending 30 Sept. 1901 amounted to \$74,397,774. The deposits (1903) were in five banks over \$1,000,000 and less than \$2,000,000; in two banks over \$2,000,000 and less than \$3,000,000; in three banks over \$7,000,000 and less than \$10,000,000, and in one bank \$17,396,260. The municipal expenditures for maintenance and operation are about \$3,300,000. The chief items of expense are as follows: schools, \$552,300; streets, \$536,000; fire department, \$194,500; police department, \$153,500; charity department, \$79,000; public library, \$51,000.

Government.—The government is vested in a mayor, whose term of office is one year; a board of councilmen, 24 members, three from each ward; and a board of aldermen, nine members elected at large. The two boards constitute the city council, who have power to accept or reject the mayor's appointments. The council elects the heads of the departments.

History.—A settlement was made here in 1673-4, called Quansigamog Plantations. The Indians were hostile to the settlers from the first; but at the beginning of King Philip's war, their hostility increased and the whites abandoned the settlement. Another attempt to found a settlement was made in 1684, but after a few years the Indians forced the whites to again leave. The second time the place was named Worcester on account of Worcester in England having been the home of some of the settlers. In 1713 the permanent settlement was made. In 1722 Worcester was incorporated; and chartered as a city in 1848. Isaac Thomas, a publisher, moved from Boston to Worcester in 1775, and until about 1800 the town was among the leading publishing places in the country.

Population.—The city ranks second in the State in population. Since 1850 it has grown rapidly. Beginning with 1800 the Federal census returns have given the following: (1800) 2,411; (1820) 2,962; (1850) 17,049; (1870) 41,405; (1880) 58,291; (1890) 84,655; (1900) 118,421; (1903, est. Gov. Report) 128,552. Consult: Rice, 'Worcester in 1898'; Hurd, 'History of Worcester County.'

Worcester, South Africa, a town of Cape Colony, 60 miles northeast of Cape Town, 109 miles by rail through Paarl and Tulbagh. The town is regularly laid out, the streets being planted with trees. It is well supplied with water from the Hex River. The vine is extensively cultivated in the neighborhood, and brandy and wine are made in considerable quantity. Pop. 6,000.

Worcester College, Oxford, England, originally called Gloucester Hall, was founded in 1714 by Sir Thomas Cookes of Bentley, Worcestershire, for a provost, six fellows, and six scholars. Under the statutes of 1882 Worcester College consists of a provost, 9 or 10 fellows, and 19 scholars. There are a number of exhibitions, two of which are connected with the Charterhouse School, and three with Bromsgrove School.

Worcester Polytechnic Institute, a technical school located at Worcester, Mass. It was

founded by a gift of \$100,000 from John Boynton of Templeton; was chartered in 1865, and opened to students in 1868. Since that time its resources have been largely increased both by private benefactions and State donations. Though one of the earliest schools of the kind in the United States, it has in every way kept pace with the progress in scientific and technical education, and is recognized as one of the leading American technical schools. From the time of its organization, laboratory and shop work has been a distinctive feature of its work; it was one of the first schools to emphasize the importance of laboratory methods, and the first in the United States to establish a workshop as an essential part of the training in mechanical engineering. The Institute offers five courses of four years each leading to the degree of B.S.; these are mechanical, civil, and electrical engineering, chemistry and general science. English, political science, French or German, and mathematics are included in all courses; the work of the Freshman year is practically the same for all courses; with the Sophomore year the special work of each course begins. The work of the junior and senior years of the general science course is largely elective; otherwise the courses are practically all required. Graduate courses are provided leading to the degrees of M.S., D.S., M.E., C.E., and E.E. The students maintain a Christian Association, chapters of several Greek letter fraternities, and an Athletic Association. The institute publishes a bi-monthly 'Journal,' containing original articles on technical and scientific subjects by the alumni and faculty, and news of the institute and general scientific progress. The institute campus comprises 12 acres on a slight elevation in the northwestern part of the city; it slopes on the north to Institute Park. The buildings on this campus are Boynton Hall, the Washburn Shops (machine and forge), the Salisbury Laboratories (chemistry, physics, and electrical engineering), the engineering laboratories (mechanical engineering), the power laboratory, the foundry, and the high potentials laboratory; the institute also owns Newton Hall, a dormitory a short distance from the campus, and a hydraulics laboratory at Chaffins, five miles distant. The laboratories and shops are all excellently equipped; the library in 1904 contained 9,100 volumes besides departmental libraries; the Worcester Free Public Library, and the library of the American Antiquarian Society are also open to students. Free tuition is given to 40 Massachusetts students in consideration of which the institute receives an annual State appropriation. The students in 1904 numbered 272; the total number of graduates was 1,012.

Worde, wörd, Wynkyn de, English printer and stationer: b. Alsace late 15th century: d. London about 1534. His name was properly Jan van Wynkyn, de Worde being a place-name referring to Worth in Alsace. He probably went to England with Caxton from Bruges in 1476, and later was an apprentice in Caxton's printing-office, in which he established himself in 1491. He printed between 700 and 800 works, which are known through fragments or at least one complete copy. This is thought to be not more than half his work. Among the books printed by him were Higden's 'Polychronicon' (1495), in which occurs the first specimen of music-type;

WORDEN — WORDSWORTH

Wakefield's 'Oratio' (1524), in which Italic type was first used in England; and Trevisa's rendering of Bartholomæus Anglicus' 'De Proprietatibus Rerum' (1496).

Worden, wôr'dn, **John Lorimer**, American naval officer: b. Ossining, Westchester County, N. Y., 12 March 1818; d. Washington, D. C., 18 Oct. 1897. He was appointed a midshipman in the navy in 1834. At the beginning of the Civil War he was captured by the Confederates but after seven months was exchanged and was subsequently ordered to the command of the Monitor, which left New York 6 March 1862. He arrived at Hampden Roads on the evening of the 8th, after the iron-clad Merrimac had destroyed the wooden frigates Cumberland and Congress. On the morning of the 9th a memorable battle was fought by the Merrimac and Monitor, the former of which was partly disabled and abandoned the fight, after several violent collisions with the Monitor. Promoted commander in 1862 and captain in 1863, he commanded the iron-clad Montauk in the operations against Fort Sumter in April of that year. In June 1868 he was promoted commodore, and in 1872 rear-admiral. He was superintendent of the Naval Academy at Annapolis in 1870-4; commander-in-chief of the European squadron in 1875-7; and was retired in 1886.

Wordsworth, wêrdz'wèrth, **Charles**, Scottish prelate, son of Christopher Wordsworth (1774-1846) (q.v.): b. Lambeth 22 Aug. 1806; d. Saint Andrews, Scotland, 5 Dec. 1892. He was educated at Harrow and Christ Church, Oxford, and, becoming a private tutor, had Gladstone and Manning as pupils. From 1835 to 1846 he was second master at Winchester School, and from 1846 to 1854 was the first warden of Trinity College, Glenalmond, Perthshire. He was elected bishop of Saint Andrews, Dunkeld, and Dunblane in 1852, and was a prominent figure in the ecclesiastical life of Scotland, being filled with an earnest desire to heal the dissensions between the different churches, and pave the way for their reunion. Besides volumes of sermons, discourses, etc., he published a widely-used 'Greek Grammar' (written in Latin) (1839); 'Shakespeare's Knowledge and Use of the Bible' (1804, 4th ed. 1892); 'Annals of My Early Life' (1891). Consult: 'Annals of My Life' (1893), edited by Hodgson; and 'The Episcopate of Charles Wordsworth' (1899) by John Wordsworth.

Wordsworth, Christopher, English Anglican clergyman, youngest brother of William Wordsworth (q.v.): b. Cockermouth, Cumberland, 9 June 1774; d. Buxted, Sussex, 2 Feb. 1846. He was educated at Hawkshead grammar school, and Trinity College, Cambridge, and was elected a fellow of his college in 1798. He held various livings in the Church, and was master of Trinity College 1820-41. He published: 'Ecclesiastical Biography' (1810); 'Sermons on Various Subjects' (1814); 'Christian Institutes,' a series of discourses and tracts (1836); 'Who Wrote Eikon Basilike?' (1824-5); etc.

Wordsworth, Christopher, English Anglican prelate, son of the preceding: b. Lambeth 30 Oct. 1807; d. Harewood, Yorkshire, 21 March 1885. He was educated at Winchester and at Trinity College, Cambridge, and from 1836 to 1844 was head master of Harrow School. He

then became canon of Westminster, and after being made archdeacon of Westminster in 1865 was appointed bishop of Lincoln in 1868. He was the author of writings connected with classical, theological, or ecclesiastical subjects, among which are: 'Athens and Attica' (1836); 'Greece: Pictorial, Descriptive, and Historical' (1839); an edition of 'Theocritus' (1844; fuller one, 1877); 'Memoirs of William Wordsworth' (1851); 'Saint Hippolytus and the Church of Rome in the 3d Century' (1853); 'The New Testament in the Original Greek' (1856-60); 'The Old Testament in the Authorized Version,' with notes and introduction (1864-71); 'A Church History to the Council of Chalcedon, 451 A.D.' (1881-3). Consult 'Life' by his daughter Elizabeth and J. H. Overton (1888).

Wordsworth, Christopher, English Anglican clergyman and scholar, second son of Bishop Christopher Wordsworth (q.v.): b. Westminster 26 March 1848. He was educated at Trinity College, Cambridge, in 1870-88 was a fellow and tutor of Peterhouse College, and in 1877 was appointed rector of Galston, in Rutland. In 1886 he became a prebendary of Lincoln cathedral, and in 1889 rector of Tyneham, Dorset. Since 1897 he has been rector of St. Peter's, Marlborough. His published works comprise: 'University Society in the 18th Century' (1874); 'Scholæ Academicæ' (1877); 'Breviarium ad Usum Sarum' (1879-86), edited with F. Procter; 'Pontificale Ecclesiæ S. Andree' (edited 1885); 'Lincoln Cathedral Statutes' (1892-7), edited with H. Bradshaw; 'Coronation of King Charles I.' (1892-4); 'Mediæval Services' (1898); etc.

Wordsworth, Dorothy, English writer: b. Cockermouth 25 Dec. 1771; d. Grasmere 25 Jan. 1855. She was the only sister of the poet, and was a woman of remarkable mental powers, who described country life with keen observation and much literary skill. Besides her 'Recollections of a Tour in Scotland' (1874) other journals and letters of hers have been published, the MSS. having been finally collected by Knight in 1897. Her mind was latterly clouded. Consult Lee, 'Dorothy Wordsworth' (1886; new ed. 1894).

Wordsworth, Elizabeth, English educator, daughter of Bishop Christopher Wordsworth (q.v.): b. Harrow 1840. She is principal of Lady Margaret Hall, Oxford, and has published: 'Illustrations of the Creed' (1889); 'Illustrations of the Decalogue' (1893); 'Life of Bishop Christopher Wordsworth' (1888); 'Saint Christopher and Other Poems' (1890); 'The Snow Garden and Other Stories' (1895).

Wordsworth, John, English Anglican prelate, eldest son of Bishop Christopher Wordsworth (q.v.): b. Harrow 21 Sept. 1843. He was educated at New College, Oxford, was ordained deacon in 1867, and in 1868 became an assistant master in Wellington College. In 1870 he was made prebendary of Lincoln, and in 1883-5 was Oriel professor of the interpretation of Holy Scripture, fellow of Oriel, and canon of Rochester. He was Bampton lecturer in 1881 and in 1885 became bishop of Salisbury. His chief publications are: 'Fragments and Specimens of Early Latin' (1874); 'University Sermons of Gospel Subjects' (1878); 'The One Religion' (1881, Bampton Lectures); 'Old

WORDSWORTH

Latin Biblical Texts' (1883-6), with Sanday and White; **'The Holy Communion'** (1891); **'Novum Testamentum Latine, secundum editionem S. Hieronymi'** (1898); **'The Episcopate of Charles Wordsworth'** (1899); **'Teaching of the Church of England for Information of Eastern Christians'** (1900); **'The Ministry of Grace'** (1901).

Wordsworth, William, English poet: b. Cockermouth, Cumberland, 7 April 1770; d. Rydal Mount, Westmoreland, 23 April 1850. He was the second son of John Wordsworth, attorney-at-law, who was descended from a Yorkshire family dating back to the Norman Conquest. His mother, Anne Cookson, belonged to an ancient family of Crackanthorpes, who had lived in Westmoreland from the times of Edward III. He was educated at Hawkshead Grammar School and at Saint John's College, Cambridge, where he entered in 1787, taking his B.A. degree in January 1791. In the summer vacation of 1790 he went to the Continent with Robert Jones, a fellow-collegian, starting, as he says, "staff in hand, without knapsacks, each his needments tied up in a pocket handkerchief, with about 20 pounds apiece in our pockets." They spent most of the time in walking through Switzerland.

He left Cambridge with no definite plans for the future. He did not feel himself, as he said afterward, "good enough for the church," and had no inclination to the law. He had studied military history with much interest, and at one time thought of going into the army, but on reflection gave up the plan. He finally went to London, where he lived for a time on a small allowance with no special aim or employment. In November 1791, he went to France, with the idea of spending the winter and learning French, but, becoming interested in the revolutionary politics of the period, remained in the country until October 1792, when his friends, fearing for his safety, stopped his funds, and he reluctantly returned to England.

He soon began to turn his attention to literary work. He had written verse in his school days, at first as a task imposed by his master, the subject assigned being "The Summer Vacation," to which of his own accord he added a poem on 'The Return to School.' This was before he was 15, for in 1785 he was called upon to write verses in commemoration of the second centennial anniversary of the founding of the school. These, he says, "were much admired—far more than they deserved—for they were but a tame imitation of Pope's versification, and a little in his style." His first publication was in 1792 (not 1793, as generally stated), a thin quarto entitled 'An Evening Walk—an Epistle in Verse addressed to a Young Lady from the Lakes of the North of England. By W. Wordsworth, B.A., of Saint John's College, Cambridge.' This was followed, the same year, by 'Descriptive Sketches in Verse, taken from a Pedestrian Tour in the Italian, Grison, Swiss, and Savoyard Alps.' The books attracted little attention, and sold very slowly; but they led to the friendship between Wordsworth and Coleridge, which proved to be a lifelong intimacy. Coleridge says in his 'Biographia Literaria': "During the last year of my residence at Cambridge I became acquainted with Mr. Wordsworth's 'Descriptive Sketches,' and seldom, if

ever, was the emergence of an original poetic genius above the literary horizon more evidently announced." Wordsworth himself did not estimate these early poems very highly. In a letter to a friend at the time he says: "It was with great reluctance that I sent those two little works into the world in so imperfect a state. But as I had done nothing by which to distinguish myself at the university, I thought these little things might show that I *could* do something. They have been treated with unmerited contempt by some of the periodicals, and others have spoken of them in higher terms than they deserved."

In the latter part of 1794 Wordsworth received a legacy of £900 from a young friend, Raisley Calvert, son of the steward of the duke of Norfolk, who owned large estates in Cumberland. They had long been very intimate when Calvert was attacked by consumption, and Wordsworth was his devoted companion and nurse until his death. The poet now felt that he could make a home for himself and his only sister, with whom, the next autumn (1795), he settled down in a cottage at Racedown in Dorsetshire. In July, 1797, they moved to Alfoxden, in Somersetshire, in order to be near Coleridge at Netherstowey. Here Wordsworth added to his income by taking a young son of Basil Montague as pupil; and here he wrote many of the poems included in the 'Lyrical Ballads,' published in the autumn of 1798 by Mr. Joseph Cottle of Bristol, who had been rash enough to pay 30 guineas (about \$150) for the copyright. The volume contained Coleridge's 'Ancient Mariner,' which he and Wordsworth had planned together, and to which the latter had contributed a few lines; together with Wordsworth's 'Idiot Boy,' 'We are Seven,' and 20 other poems. Among these were the famous lines on 'Tintern Abbey,' which were written just before the book appeared. Five hundred copies were issued, but most of them were afterward sold to a London bookseller at a sacrifice. When Cottle gave up business soon afterward, his copyrights were transferred to Mr. Longman of London, and in the estimation of their value the 'Lyrical Ballads' were put down as "worth nothing." Cottle therefore asked that the copyright might be given back to him, and, the request being granted, he made a present of it to the authors, who both lived to see it become a piece of really valuable literary property. It is not easy to imagine a book containing 'The Ancient Mariner' and the 'Tintern Abbey' reckoned absolutely worthless, from a commercial point of view, only about a century ago.

Immediately after the publication of the 'Lyrical Ballads,' Wordsworth, his sister, and Coleridge sailed for Hamburg, with a view of perfecting their acquaintance with the German language by a winter at Goslar. During the four months spent in that dull and dismal town, in a particularly cold and disagreeable season, Wordsworth wrote some of his best and most characteristic poems, full of the loveliness of English rural scenery and life. Coleridge traveled independently of his friends a part of the time they were abroad, but the three made excursions together in the rural districts of Germany, and had some unpleasant experiences. Sometimes they found it difficult to obtain food and shelter in the wretched inns of the country.

WORDSWORTH

In one instance, as Coleridge records, they were actually driven out of doors and had to spend the night in the fields. But they met with no worse misadventures than these, and the Wordsworths got safely back to England in the spring of 1799.

The poet was always fond of travel, and in later years frequently indulged in it both in the British Isles and on the Continent. In August 1802, he went to France again, and in 1803 and 1814 visited Scotland. In 1820 he went with his wife and sister through Switzerland and Italy. In 1823 he traveled in Holland, in 1824 in North Wales, in 1828 in Belgium with Coleridge, and in 1829 in Ireland with his friend Marshall. In 1831 he and his daughter visited Scott at Abbotsford. In 1833 he made another tour in Scotland, and in 1837 a long one in Italy with Crabbe Robinson. In all these journeys he found more or less material and inspiration for his poems.

After his return to England in 1799 he and his sister decided to settle down in their ancestral Lake Country, and soon took a small cottage at Grasmere. Here and in the immediate vicinity the remainder of their lives, except for the occasional journeys abroad, was passed in domestic and poetic seclusion, with few important incidents to disturb the calm current of the lapsing years. In 1802 the poet married Mary Hutchinson, whom he had known from childhood and with whom he had attended the same "dame's school" at Penrith, where his boyhood was partly spent with his mother's parents. After his marriage he and his wife continued to reside with his sister at Grasmere, and there three of his children were born. From 1808 to 1813 the family lived in the same neighborhood in two other houses, and then removed to Rydal Mount, a few miles distant, which was the poet's home for 37 happy years. There, among his native lakes and hills, he died in his eighty-first year.

In his early manhood the poet's resources were very slender, but his tastes were simple and he made what he had suffice for his needs. He and his sister managed to live for six or seven years on about \$500 a year. Later he came into possession of a little property, and later still was appointed stamp-distributor for Cumberland and Westmoreland, an office worth £500 a year, the duties of which were mostly discharged by a clerk, leaving the poet leisure for his literary pursuits. In 1803 he became acquainted with Sir George Beaumont, a descendant of the dramatist and a cultivated man, who presented him with a beautiful piece of land at Applethwaite, near Skiddaw, hoping that he might be induced to settle there, but he could not make up his mind to leave his chosen home at Grasmere. His friendship with Beaumont remained unbroken until the death of the latter in 1827.

Wordsworth retained the stamp-collectorship until 1842, when it was transferred to his second son. A more lucrative office, the collectorship of Whitehaven, was offered him, but he declined it, being unwilling to exchange his secluded life at Rydal "for riches and a load of care." In 1843, he was made poet-laureate on the death of Southey. He declined the honor at first as imposing duties which at his advanced age he hesitated to undertake; but he finally accepted it, at the personal solicitation of Sir Robert Peel, who assured him that nothing "should be re-

quired of him," adding that the appointment was "a tribute of respect justly due to the first of living poets," that "the queen entirely approved of the nomination," and that there was "one unanimous feeling on the part of all who had heard of the proposal that there could not be a question about the selection."

In 1800 a second edition of 'Lyrical Ballads,' with other poems, was published, and others appeared in 1802 and 1805. Meanwhile the poet had made few friends and many and bitter enemies. The issue of two more volumes of 'Poems' in 1807 led to a fresh onslaught upon the author, who persisted in writing verse after the autocratic 'Edinburgh Review' had given judgment against him. Jeffrey, in noticing the new volumes in the 'Review,' remarked: "Even in the worst of these productions there are, no doubt, occasional little touches of delicate feeling and original fancy; but these are quite lost and obscured in the mass of childishness and simplicity with which they are incorporated." Such was the high critical verdict upon a collection of poems that included the 'Ode to Duty,' the 'Sonnets dedicated to Liberty,' 'The Happy Warrior,' the exquisite lines, "She was a Phantom of Delight," etc., and the sublime 'Ode on the Intimations of Immortality.' Eight years elapsed before another edition of the poems was printed; and the year previous (1814) Wordsworth had published 'The Excursion.' Five hundred copies of this sufficed to supply the demand for six years. The new poem was savagely treated by Jeffrey, who boasted that he had "crushed 'The Excursion.'" Southey remarked: "He might as well seat himself on Skiddaw, and fancy that he crushed the mountain." Jeffrey began his crushing criticism with "This will never do," and went on to pronounce the poem "longer, weaker, and tamer than any of Mr. Wordsworth's other productions"; but though he and his fellow reviewers prevented the sale of the poem, they could not kill it, in spite of its obvious faults.

Other volumes were brought out by the undismayed poet in 1815 ('The White Doe of Rylstone'), in 1819, 1820, and 1822, and all were condemned by the 'Edinburgh Review' as they appeared; but the reaction had now begun among the critical authorities, and henceforth Wordsworth had powerful defenders in literary circles. "War was no longer waged *against* his poems, but rather *concerning* them." It was, however, a long fight yet before their rightful position was accorded them by the general consent of the contending parties. De Quincey has well summed up the matter thus: "From 1800 to 1820 the poetry of Wordsworth was trodden under foot; from 1820 to 1830 it was militant; from 1830 and onward it has been triumphant." And the triumph was complete. There were still those who could see little to admire in the meditative measures of the Cumberland recluse, but the general verdict was in his favor, and his place among the great poets of our literature was secure beyond dispute. Honors, too, were conferred upon him. In 1839 he received the degree of D.C.L. from Oxford University; and the enthusiasm of the audience on the occasion was such as had never been known except upon the visits of the Duke of Wellington. One who was present says: "Scarcely had his name been pronounced than from 3,000 voices at once there

WORK—WORKHOUSE

broke forth a burst of applause, echoed and taken up again when it seemed about to die away, and that thrice repeated." The poet no doubt went through the ceremony with his wonted calmness and composure; but it was none the less significant as a tribute to the man and a testimonial that he had fairly won the laurel crown. A few years later, as we have seen, he received the further honors of a government pension and the laureateship.

Wordsworth's famous theory of poetic art was first set forth in the preface to the second edition of the 'Lyrical Ballads' (1800), and more at length subsequently in prefaces and appendixes. He took the ground that not only might the poet draw his subjects from common life, but he might treat of them in the language of common life. "I have proposed to myself," he says, "to imitate and, as far as is possible, to adopt the very language of men. . . . I have taken as much pains to avoid what is usually called poetic diction as others ordinarily take to produce it." And again he asserts that "there neither is, nor can be, any essential difference between the language of prose and metrical composition." But his theory was the result of his rebellion against the highly artificial style of Pope and his school, and, like many reformers, he was at first inclined to go too far in the opposite direction. He himself admitted this later by giving up the puerile style in which many of his earlier poems were written, and adopting a more elevated diction, and also by changing some of the most prosaic expressions in those early poems. To take a single brief example of these emendations, in 'The Thorn,' one of the 'Lyrical Ballads,' as printed in 1798 and 1815, we have this arithmetical statement:

And to the left, three yards beyond,
You see a little muddy pond
Of water never dry,
I've measured it from side to side,
'Tis three feet long and two feet wide.

Crabbe Robinson told Wordsworth that "he dared not read these lines aloud in company." "They ought to be liked," was the poet's reply; but he nevertheless modified the last two lines in 1820, so that now they read:

Though but of compass small, and bare
To thirsty suns and parching air.

Wordsworth was much gratified at the comparatively early appreciation of his works in this country. The 'Lyrical Ballads' were reprinted at Philadelphia in 1802, and an edition of his poems in four volumes appeared in Boston in 1824. A complete edition was brought out (Philadelphia 1837) by Prof. Henry Reed, with whom the poet interchanged many letters. In one of these he says: "The acknowledgments which I receive from the vast continent of America are among the most grateful that reach me." Reed's edition was revised and enlarged in 1851. In 1854, a Boston edition in 7 vols. was published, with a biographical introduction (though without his name) by James Russell Lowell. Thirty years later (1884) when Lowell was minister to England, he was made president of the Wordsworth Society, and in the closing words of an address on that occasion he thus aptly and admirably expressed what we may call the "true mission" of the poet:

"As in Catholic countries men go for a time into retreat from the importunate dissonances

of life to collect their better selves again by communion with things that are heavenly and therefore eternal, so this Chartreuse of Wordsworth, dedicated to the Genius of Solitude, will allure to its imperturbable calm the finer natures and the more highly tempered intellects of every generation, so long as man has any intuition of what is most sacred in his own emotions and sympathies, or of whatever in outward nature is the most capable of awakening them and making them operative, whether to console or strengthen. And over the entrance gate to that purifying seclusion shall be inscribed,

Minds innocent and quiet take
This for a hermitage."

The best editions of Wordsworth's poems are Prof. Edward Dowden's (1892) and Prof. William Knight's (1896; a great improvement on his edition of 1882-6). Macmillan's one-volume edition of 1888, with introduction by John Morley, is the next best. Of the 'Selections from Wordsworth' the best are Matthew Arnold's (London 1879) and the one compiled by Knight and other members of the Wordsworth Society (London 1881). Among the criticisms on the poet those in Principal Shairp's 'Studies in Poetry and Philosophy' (1876) and his 'Aspects of Poetry' (1881), and in Stopford Brooke's 'Theology of the English Poets' (pp. 93-286 being devoted to Wordsworth) may be commended; also the volume entitled 'Wordsworthiana' (1889), a selection from the papers of the society, including the presidential addresses of Matthew Arnold, Lord Houghton, Lord Selborne, and Mr. Lowell. The society was formed in 1880 and was kept up for seven years. The meetings were held for two years at Grasmere and afterward in London. Beginning as a small semi-private club, it had increased in 1886 to 344 members. The most complete biography of Wordsworth is that by his nephew, Christopher Wordsworth (2 vols. 1851); but the briefer one in 'English Men of Letters,' by F. W. H. Myers (1881) is, on the whole, to be preferred. Consult also: E. Lee, 'Dorothy Wordsworth' (1886); Legouis, 'La Jeunesse de William Wordsworth' (1896). The poet's prose works were collected by the Rev. A. B. Grosart in 1876, and another edition was published by Knight in 1896. W. J. ROLFE,

Author of 'Life of Shakespeare.'

Work, Henry Clay, American song writer and inventor: b. Middletown, Conn., 1 Oct. 1832; d. Hartford, Conn., 8 June 1884. He was a printer for a time, but studied harmony and became widely popular during the Civil War period by his songs, such as 'Kingdom Comin'; 'Wake Nicodemus'; 'Babylon is Fallen'; and 'Marching Through Georgia.' He wrote also temperance songs, which had a wide circulation, among them, 'Father, Dear Father, Come Home with Me Now'; and sentimental melodies like 'My Grandfather's Clock' and 'Lily Dale.' Among inventions by him were a rotary engine and a knitting machine.

Workhouse, in the United States, a correctional prison for petty offenders. In England the poor-house is called a "workhouse." Workhouses appear to have been correctional originally in England also and were first erected in

WORKINGMEN'S ASSOCIATION — WORLD

the reign of Charles II. in order to compel rogues and vagabonds to work for a living. Act 9, Charles I., ch. vii., entitled the churchwardens or overseers of the poor, with consent of the majority of the inhabitants, to establish workhouses for lodging and maintaining the poor, and made various arrangements for union of parishes for this purpose. By 34 and 35 Victoria, ch. cviii., the guardians of every union are bound to provide casual wards, with such fittings as the poor-law board consider necessary, for the accommodation of the casual poor. Every workhouse has to keep a register of religious creeds, and also a register of persons under 16, hired out as servants or apprentices, whom the relieving officer must visit twice a year to inquire into their food and treatment. The inmates of workhouses are not allowed to go out and in at pleasure, and the able-bodied are compelled to work when required. In suitable situations they are often employed in field labor. Married persons are separated unless both are above 60 years of age. Drunkenness, misconduct, or refusal to work, exposes to the penalty of imprisonment with hard labor. The workhouses, after being under the control of the poor-law board, were placed under the local government board in 1891.

In Scotland the legal designation of houses provided for the accommodation of the poor is poor-houses, as in America, the designation "asylum for the poor" being also used in the United States. See CHARITIES, PUBLIC.

Workingmen's Association, International. See INTERNATIONAL WORKINGMEN'S ASSOCIATION; SOCIALISM.

Workingmen's Clubs, organizations for educational and social purposes composed of workingmen, but having none of the benefit or industrial features of the trade-union. In the United States they are not numerous, and where they exist are organized by those interested in philanthropic work for the benefit of workingmen, and are usually largely educational. In Europe, however, clubs are often formed by the workingmen themselves, and are sometimes political, usually socialistic, and sometimes purely social; there are also numerous philanthropic clubs, especially in England, organized generally under church auspices. These are both social and educational.

Workington, wër'king-tôn, England, a seaport and manufacturing town in Cumberland, near the mouth of the Derwent, which enters the Solway Firth 33 miles from Carlisle. It has a good harbor furnished with a break-water, and provided with docks. The municipal borough, incorporated 1888, does not include the whole of the previously existing urban district. The town is of importance from its industrial establishments, which comprise large iron-smelting works and works for steel rails, iron plates, etc.; it has a ship-building yard and collieries, and carries on a considerable shipping trade. Pop. (1901) 26,141.

Workingwomen's Clubs, organizations for educational and social purposes for workingwomen. The formation of these clubs was begun in Boston in 1890, and they are now numerous throughout the United States; there is a National League of Workingwomen's Clubs; and several State leagues. These clubs have

been organized on the initiative of women outside the working class, and include in their membership both workingwomen and "women of leisure"; one of their great benefits is the promotion of understanding and sympathy between these two classes. The clubs are entirely self-governing, all members being on an equal footing and having equal share in the management. They are also self-supporting by means of moderate fees and the proceeds of entertainments. The club rooms furnish the workingwomen with a place of recreation with pleasant surroundings, and the social feature is emphasized, but the educational side is not neglected; public questions are discussed, and instruction in domestic science, stenography, etc., is given. In some cases the clubs have been instrumental in obtaining reforms in industrial conditions for women; the Massachusetts State League, for instance, was largely influential in establishing the eight-hour day in Boston department stores.

Workshop Regulations. See FACTORY LAWS.

Work'sop, England, a town of Nottinghamshire, on the Ryton and the Chesterfield Canal; 16 miles east-southeast of Sheffield. It lies near the northern extremity of Sherwood Forest, in a district known as the "Dukery," from the number of ducal seats. Its parish church, dating from 1103, was an ancient Norman abbey church. There are manufactures of agricultural implements, mill machinery, chemicals etc., and there are iron and brass foundries. Pop. (1901) 16,112.

World, The. Tables showing the total area, number of inhabitants, and density of population of each of the principal divisions of the world's land surface; also the area and density of population of each of the republics and European dependencies in the Western hemisphere; based upon the important work of Alexander Supan, 'Petermann's Mittheilungen, Ergänzungsheft' (Nr. 146, Gotha: 31 March 1904).

The grand total of the earth's population, as shown in this most recent computation, is 1,503,300,000; the total area of the seven divisions or groups, which include all of its continents and islands, is 144,110,600 square kilometres; and the average density of population is 10 persons to one square kilometre. The distribution (rearranged and condensed with a view to giving prominence to the facts which are of special interest to our readers) is as follows:

	Sq. kilom.	Inhab. Population to 1 sq. kilom.
North America (including West Indies, Mexico)		
Central America, and Panama)	20,817,700	105,714,000
South America	17,744,900	38,482,000
Europe	9,723,600	392,264,000
Asia	44,179,400	819,556,000
Africa	29,820,200	140,790,000
Australia and Polynesia	8,951,800	6,483,000
Polar Lands (including the Arctic islands, Greenland, Iceland, the Spitzbergen group, Franz-Josef-Land, etc., and the Antarctic mainland and islands)	12,873,000	91,000

The total area of the American continents and islands is 38,562,600 square kilometres, and their total population 144,196,000, distributed as follows:

World-English, the name given by Prof. A. Melville Bell to a proposed new phonetic system of spelling the English language, so as to render its acquirement by foreigners more easy, and to make it available for international use.

World's Columbian Exposition, an international exposition held in Chicago, Ill., in 1893, to celebrate the 400th anniversary of the discovery of America by Columbus.

History.—The fitness of some special celebration of the discovery of America had been recognized and the question agitated several years before the bill providing for a Columbian Exposition was introduced in Congress in 1889. Several cities urged their claims for the site of the exposition; chief among them were New York, Chicago, Washington, and Saint Louis; Chicago was finally chosen as the site, and the bill passed and approved 25 April 1890. The organization of the fair was placed under the charge of an Illinois corporation previously organized, and the World's Columbian Commission, a national commission consisting of delegates appointed two from each State and Territory,

two from the District of Columbia, and eight at large. Harlow N. Higginbotham was president of the former, and Thomas W. Palmer of the latter; George R. Davis was appointed director-general. Exposition headquarters were established in Chicago in January 1891. A Department of Publicity and Promotion was established, and a Board of Lady Managers with Mrs. Potter Palmer at its head, and a World's Congress Auxiliary with C. C. Bonnelly as president were organized. The work of construction was placed under the charge of a Bureau of Construction of which Daniel H. Burnham was chief; work was begun on the first building in July 1891. On 23 Oct. 1892 the buildings were formally dedicated by the Vice-President of the United States; the dedication ceremony, which was attended by 130,000 people, was held in the Manufactures and Liberal Arts Building. The exposition was formally opened 1 May 1893 by President Cleveland; at the moment when he declared the fair open the flags of the various nations were unfurled, the electric fountains turned on, and the statue of "The Republic" unveiled. The attendance at the fair increased toward the close; the days showing the largest attendance were 9 October, Chicago Day, and 4 July, American Independence Day; the average daily attendance was 172,712. The exposition was formally closed 30 October; preparations had been made for elaborate closing ceremonies, but the assassination of Mayor Harrison of Chicago two days previous prevented the carrying out of the proposed programme.

Financial.—The bill providing for the exposition required the city of Chicago to raise \$10,000,000 toward the expenses; later Congress provided for the gift of a special mintage of \$2,500,000 in souvenir half-dollars, the exposition authorities also issued \$5,000,000 worth of debenture bonds; about \$3,000,000 additional were received from other miscellaneous sources, so that about \$20,000,000 was available before the opening; the total expenditures for the fair were over \$31,000,000, and the profits about \$1,850,000. The United States Government appropriated \$2,250,000 to its exhibits, the States \$6,060,350, the foreign governments \$5,830,000, and over \$350,000 was invested in the Midway Plaisance.

Buildings and Principal Exhibits.—The site chosen for the exposition was Jackson Park, a portion of the South Park system of Chicago; it covered 666 acres and extended about two miles along the shore of Lake Michigan. There were about 150 buildings erected; the more important were built of the material called "staff," a composition of plaster of Paris and jute fibre, which produced the general effect of white marble, hence the exposition grounds became generally known as the White City. One channel from the lake led into a pond in the southern part of the grounds, and north of this another channel led into a long basin; this second channel passed underneath a handsome bridge and colonnade. The basin was joined by an artificial canal to the lagoon, a small lake, containing Wooded Island. About the basin and lagoon the principal buildings were grouped. The space about the basin was known as the Court of Honor. The Manufactures and Liberal Arts Building faced the lake near the eastern end of the basin; this was the largest building ever constructed for an exposition; it cov-

WORLD'S COMMERCE

ered nearly 31 acres; the main roof was of iron and glass. At the head of the basin was the Administration Building, with its gilded dome; near this were the Agricultural Building, Machinery Hall, and the Electrical and Mining Building. On the west of the lagoon were the Transportation Building and Horticultural Hall, and on the east the Government Building, with a large dome 150 feet high; at the northwestern end of the lagoon was the Woman's Building, and at the northeastern end the Fisheries Building. Still further to the north were the State buildings, many of the foreign nations' exhibits, and the Fine Arts Building. The Fine Arts Building was an example of purely classical architecture; it was entered by four richly ornamented portals. The State and foreign nations buildings were in many cases copies of some characteristic historic building or type; as, for example, Virginia's building was modeled on Washington's Mount Vernon home, Massachusetts' was a copy of John Hancock's house; England's represented a manor house of the time of Henry VIII., and Spain's the Convent of La Rabida. In the southern part of the grounds was the Forestry Building, built in the rustic style; the columns supporting the roof being made of tree trunks furnished by the different nations and the States and Territories of the United States. Near the Forestry Building were a number of the small exhibits, the Krupp exhibit, dairy, etc. The Manufactures and Liberal Arts Building included in its exhibit everything related to engineering, architecture, publishing, technical and domestic arts, together with education, the professions, music, and the drama. The Fine Arts exhibit included many masterpieces of painting and sculpture, the Woman's Building contained a collection representing woman's work in all lines of activity; the Transportation Building's collection represented all modes of transportation from the most primitive to the most complete modern inventions of ocean steamers and locomotives; and the exhibits of the other special departments of human industry showed most excellently the progress of the race in each special industry. The architectural effect of the buildings was enhanced at night by the use of electric lights outlining the buildings, search lights, and the electric fountains playing in changing colors.

Special Features.—Among the special features of the exposition the Midway Plaisance was perhaps most interesting; on this were represented the villages of different nations and peoples, including the Irish village, the Javanese village, the Japanese bazaar, the Samoan and Dahomey villages, etc.; here also were the "Street of Cairo," and the various amusement features; and the Ferris wheel, 250 feet in diameter, carrying 36 coaches. Other special exhibitions of interest outside the main buildings were the reproduction of the cliff dwellers' buildings at Battle Rock Mountain, Colo.; the models of Columbus' three caravels, of the Viking ship, and of a modern United States battleship. Another interesting feature of the exposition was the numerous world's congresses held on the grounds under the auspices of the World's Congress Auxiliary. These congresses discussed the leading phases of professional, scientific, economic, educational and religious thought; the World's Parliament of Religions probably attracted the most general attention.

World's Commerce. The commercial status of each nation in the world is properly judged by the total value of its exports year by year, compared with those of other nations. On this basis the United States leads. The value of each nation commercially to the other nations rests upon the total imports. In this respect Great Britain leads, with Germany second and the United States third. Were it not for its protective tariff the United States, with its gigantic, heavily-consuming home market, would lead and lead immeasurably, to the detriment of its manufacturers, merchants, farmers and wage-earners alike. Expressed in round millions the exporting and importing rank of each nation in the world, with the share of the United States therein, is shown to be as follows, quoting the Statistical Abstract of the United States, 1903:

	Exports	United States share	Imports	United States share

WORLD'S SILK INDUSTRY

Except for some trifling fractions of value the Statistical Abstract shows that America is not doing business either way with Bulgaria, French East Indies, Siam, Servia, Persia, Paraguay, Rumania, Korea, the German colonies or Bolivia. The American trade with Norway is included in the figures for Sweden, and that with Finland forms part of the small totals of our exports to and our imports from that empire. The total commerce of the United States with Russia was only \$14,000,000 of her \$697,000,000 total foreign commerce, while with Japan we did \$62,000,000 (four and one half times as much as with Russia), of her \$274,000,000 total foreign trade. In other words, the United States did not share in \$683,000,000 Russian business, while Japan did only \$212,000,000 outside of us. That is more than three to one in favor of Japan in its prospective value tons as buyer and seller. See COMMERCE.

World's Silk Industry, The. The French French silk experts estimate the production of raw silk in the world at 70,000,000 pounds, with a valuation of \$475,000,000 annually in finished goods. At best, however, the estimates are arbitrary, on account of the inability of the best informed to determine with accuracy the raw silk production in the Oriental countries. In Asia, as in Europe, the coarser and inferior silks are kept at home; America, which is now the largest purchasing silk market in the world, uses only the finest and best. What may be called "country silk" is reeled in households and by primitive methods and is suited only for hand-loom and the cheapest labor and the cheapest fabrics. The silk production of China, Japan, India, Tonquin, and Annam is estimated as 32,000,000 pounds. Possibly one half of this may not improperly be classed as "country silk." A percentage of "country silk" is also raised and used in Italy, the Caucasus, Brutia, Syria, Persia, and Turkestan. It is only in the countries where labor is low-priced that these inferior silks can be manipulated to advantage in the manufacturing processes. By "country silk" is meant raw silk not usually classed as suitable for export, and though some of it is shipped to Europe for manufacturing the cheapest grades of silk, it cuts no figure in the American market.

France.—Power loom weaving was not introduced in France until after the successful experiments in Switzerland. The beginning of the precedence of Lyons was first attained in the 16th century. By that time the industry had concentrated there. Earlier silk-making had flourished at Avignon under the patronage of the popes; then the manufacture was divided and was equally recognized at Tours (1480), Paris, Nîmes, and Lyons (1520); finally the latter place drew to itself the chief importance. Here were used the best Italian and Spanish raw silks, and soon the large purchases made by Germany and the Netherlands gave great impetus to the industry in France. Lyons gained in prosperity over the other French towns, because, for one reason, it was exceptionally well favored by its geographical position. The four annual fairs held at Lyons drew people from remote distances, merchants, manufacturers, travelers, and Italians who established themselves there in silk-weaving colonies. In 1609 the town had a couple of thousand looms. Before the Edict of Nantes (1685) there were 18,000 looms. From 5,000 in 1701 the number increased to

15,000 in 1785. Later came the Revolution and the looms decreased again to about 5,000. Then the times mended, and France and Lyons began slowly to recover their prestige in the manufacture of silk. A count in 1873 showed 110,000 hand looms at Lyons and the country within a radius of 40 miles. In 1887 the increase had resulted in 145,000 looms; and the product, 400,000,000 francs or \$80,000,000, represented two thirds of the output of France. The remaining third was divided between Saint Etienne, Saint Chamond (the ribbon centres), Paris, Nîmes, Tours, and Calais. The year 1865 is fixed as the apogee of prosperity at Lyons. Previous to that period there had been a great and constant demand from the United States. As soon as Switzerland, Germany, and the United States began to make some distinctive showing in silk manufacture, it was understood in France that competition had arisen to reduce the cost of the production. Progress in the construction of machinery permitted these countries to produce equally well similar goods, and destroyed the personal superiority of the workman. Customs barriers were also raised against the Lyons trade. Fashion, giving vogue to low-priced goods that could easily be produced, moreover, paralyzed a portion of the Lyons manufacture. It is enumerated that it became essential to produce "stuffs the most simple" and also goods mixed with cotton and woolen. Dyeing in the piece was undertaken. Tulle and crepe had been the only products woven in the raw. During the 30 years though, from 1870 to 1900, every kind of plain and figured weave was tried in France in raw silk. The art of the dyer and finisher, it is asserted, was carried forward to perfection. The power loom was also introduced; and a low price in production was sought in the delicacy of the raw silk used, together with the rapidity of the loom. The number of power or "mechanical looms" in 1873 was only 7,000; but in seven years these increased to 20,000. In 1894 they numbered 25,000 and in 1900, 30,638. The production of mixed silks, which was about 30,000,000 francs before 1870, rose to 69,000,000 in 1878, to 160,000,000 in 1880. It is pointed out that the manufacturers at Lyons, with an extraordinary suppleness, equaled by the rapidity of execution the mobility of the fashions. They passed from plain to figured goods, from the costly to the low-priced, from all silk weaves to silk mixed with cotton and wool. These articles varied without limit, taffetas, satins, velvets, plushes, poplins, foulards, laces, silks for linings, umbrellas, figured silks for upholstery, and passementeries. One of the secrets of strength, it is said, was in the division of labor. Every manufacturer, and all the succession of operatives whom they employed, concentrated their attention on one species of weave and stuck to it with the best results.

From the very beginning of 1861, when the silk duties in England were removed by its free trade policy, the French silk manufacturers greatly profited by sending their goods in large consignments across the Channel. English consumers were seduced by the novelty of the goods, and were influenced by the Parisian modes.

France, with its competitors, has the advantage of getting its inspiration from the world.

WORLD'S SILK INDUSTRY

It sends its products to every market in Europe, to Asia, Africa, and America. Its success is displayed by the figures of exportation of silks which fluctuate between 250,000,000 and 350,000,000 francs, according to the price of silk in the raw and following the nature, low or advanced, of the goods required for consumption. France absorbs a great part of the silk raised by Asia for the commerce of the West. In 1890 it employed 4,500,000 kilograms of raw silk and 800,000 kilograms of waste silk. In 1900 its consumption of raw silk was 400,000 kilograms less. Following are the figures of the Lyons production, and the exports and imports for all France in 1900:

amounted in value to \$20,000,000 annually. Half of this output was taken by the continent. At Crefeld, where, in 1883, there were 39,463 hand looms and 1,467 power looms, the manufacture is more varied. About half the looms in those days, though, were devoted to velvets and plushes. Cotton played a great part in the manufacture. It was estimated that Crefeld made use of 2,200,000 pounds of cotton, 8,000,000 pounds of schappe or spun silk, and 8,800,000 pounds of reeled silk. The growing industry in the United States in the manufacture of velvets has decreased the output at Crefeld very noticeably in the last few years. From one half to two thirds of all the silk goods manufactured

Value of franc in United States currency 19.3 cents.

The exports of silk goods from France have greatly fallen off since 1870. In that year they were 134,352,872 francs, to the United States alone, and to all countries 485,093,505 francs. In 1870 France exported plain silk dress goods alone to the value of over 350,000,000 francs.

Additional silk production in France in 1900 amounted to 85,000,000 francs, ribbons at St. Etienne, and 110,000,000 francs, laces and novelties at Calais, Le Nord and Paris.

Germany is next in importance to France in silk manufacture in Europe. The silk industry was established in Germany first at Berlin. The workmen were French, going from France about 1685. After 20 years, however, there were not more than 1,000 looms. Later, in order to take advantage of the cheap labor offered elsewhere, the Berlin manufacturers went to Crefeld, Elberfeld, Barmen, Weiser, and Ronsdorf. These places became the centres of the industry. They began to make a specialty first of velvets and next of ribbons and piece goods of mixed materials. The total of the looms in 1844 was estimated to be 25,000. After a decade the increase made them number about 42,000. In 1873 they counted 87,000. The product in 1844 amounted to about \$18,000,000, or 72,000,000 marks. That value had been raised in 1873 to 180,000,000 marks, or \$45,000,000. Three fifths of the product was then in velvets and plushes. When 15 more years had come and gone there were in 1887, at Elberfeld, Barmen, Ronsdorf, and the Grand Duchy of Baden 30,000 looms, making goods, chiefly ribbons, for export that

at Crefeld, of whatever sort, are for export, chiefly to England and the United States. The loom equipment in 1901 at that manufacturing centre was 11,939 power looms and 6,293 hand looms. The table on the following page gives the figures of silk production (piece goods and velvets) in Crefeld, and the exports and imports for all Germany in 1900.

Switzerland.—In Switzerland, the first silk power loom weaving on the continent on the factory system was inaugurated by the Schwarzenbachs at Adlisweil. It was in 1860 that the industrial experiment was successfully tried by waterpower. The enterprise of the Schwarzenbachs finally enlarged the plant, but there are many difficulties in introducing new methods in silk weaving. It will be remembered that Vaucanson was set upon by rival weavers at Lyons in 1744, and soundly beaten for his temerity in introducing a new system of weaving. Among the familiar difficulties that formerly had to be overcome in the successful introduction of labor saving mechanisms may be mentioned: (1) The natural or inherent prejudice by the "operative"

Value of mark in United States currency 23.8 cents.
In southern Germany there are 3,652 power looms, which, being operated by Swiss ownership, are commercially known as "Swiss Production." The value of this production in 1900 was 17,600,000 marks. There are also a number of silk establishments making gloves, knit goods, laces and passementerie in Saxony, and umbrella silks in other parts of Germany, concerning whose statistics and production no reliable information is available. The silk ribbon industry at Elberfeld and Barmen is likewise for the same reason not included in foregoing figures.

class against any and all new systems. (2) The natural longing in favor of the old ways or customs. (3) The slow advance in educating operatives. (4) The unwillingness of operatives to favor a factory system, which through systematized control and discipline enables the same operative to work a far less number of hours and for better pay than was possible under the individual or independent system. These prejudices were very strong 40 years ago in all countries. In England the male operatives rose *en masse* against the introduction of steam power in the mills and factories. On the continent no woman could withstand the opprobrium of being called a "factory girl." Even in progressive Switzerland progress was at first very slow in familiarizing the population with the new method of weaving. Switzerland depends considerably on America for a market. Like the industry in Germany, the silk making in Switzerland is the result of a few looms scattered here and there in the country at the end of the 18th century. The operatives combined agriculture with weaving. The centres of the production finally became Zürich and Basel, the latter devoted to ribbons. In 1811, Zürich possessed 7,000 looms, producing silks valued at \$1,000,000; in 1830, the return was 9,000 looms; in 1839, 15,000; in 1855 the number of looms had

risen to 25,000; in 1872, to 27,000; in 1883, about 30,000 were scattered in the canton of Zürich and the neighboring cantons of Zug, Schwyz, and Unterwalden. Thereafter the number of hand looms began to decrease, and the number of power or mechanical looms to increase. There were in 1871 only 920 mechanical looms; but that number was increased in 1881 to 3,151, and to 4,129 in 1885. Since then the progress has been constant. In 1891 they numbered 7,173, in 1895, 9,609, and in 1900, 13,326. Of this number 11,163 were employed on plain and twilled weaves, 2,133 on Jacquard weaves, and 30 were velvet looms. There were also 8,563 power looms in factories beyond the Swiss frontier, but working for Swiss firms. The number of hand looms in Switzerland had decreased in 1900 to 19,544, and 2,309 additional were in factories beyond the Swiss frontier, but working for Swiss firms. A total of 46,619 persons were employed in 1900, 24,816 being employed in the hand-weaving branch (but many of these do not weave during the summer months), and 15,475 in the power-weaving branch. About 4,000 persons are employed in the throwing mills, 2,000 in silk dyeing, 322 in silk finishing and 43 in "conditioning" houses. The raw materials consumed in 1900 were 2,566,379 pounds of raw silk, 26,506 pounds of

WORLD'S SILK INDUSTRY

"schappe" or spun silk, 920,233 pounds of cotton yarns, and 8,085 pounds of wool and other yarns.

In 1900 the exportation of silk piece goods from Switzerland was \$20,000,000. The consumers are the English, French, Americans, and Germans; about \$730,000 worth goes to Austria. Belgium and Holland together take \$650,000. At Basel the production of ribbons amounted in value in 1846 to 20,000,000 francs; in 1857, to 45,000,000; in 1862, 31,000,000; in 1872, to 65,000,000, or \$13,000,000. Later the production presented considerable variation, and the fall was often to 30,000,000 francs a year, due to the growth of the manufacture of ribbons in the United States. But the annual production in Switzerland of broad goods, ribbons, and laces reached a value in 1900 of about \$38,000,000. The exports of silk piece goods from Switzerland have shown a constant increase since 1890, with the exception of 1893-4, which was a bad year for the silk industry in all countries. The increase in the exports since 1890 has been 37 per cent. Swiss silk manufacturers concede that 95 per cent of their production is for export. The following table shows in detail the production, exports, and imports of silk piece goods in 1900:

Genoa; and at Turin the manufacture includes a variety of goods. Sicily is devoted chiefly to the manufacture of ribbons. At the beginning of the 17th century there were several weaving shops as well as a few velvet looms in Como, but it took about 150 years more before there was an improvement worth mentioning in the silk industry. In the province of Como alone in 1900 there were 32 manufacturers with 3,965 power looms; in the province of Milan, 7 manufacturers with 3,360 power looms, and in other provinces of northern Italy 5 manufacturers with 795 power looms. The total Italian output annually was reckoned in 1901 the equivalent of about \$14,000,000, the loom equipment of Italy being 8,490 power looms and 11,000 hand looms. The indicated imports and exports of silk piece goods, etc., in 1901, are shown on the following page. The value of the exports average \$6.00 per pound, and the value of the imports \$7.00 per pound. The exports of silk fabrics from Italy to Great Britain have greatly increased in recent years, having more than doubled since 1897, and quadrupled in quantity since 1895. It is evident likewise that the Italians are able to manufacture more successfully, as their silk goods exports to all countries were

Value of franc in United States currency 19.3 cents.
At Basel, in addition, about 80,000,000 francs worth being the largest consumer.

of ribbons are now produced annually, Great Britain

Italy.—It is estimated that Italy now employs about 1,500,000 persons in her sericulture. The average yield of raw silk is about 10,000,000 pounds reeled from Italian cocoons, and another 2,000,000 pounds adding the reeling of imported cocoons. The value of the silk crop at the prices of the past few years averages \$45,000,000 to \$50,000,000. About 80 per cent of the output is exported to supply the silk manufacturers of France, Switzerland, Germany, Russia, England, and the United States, the remainder being consumed in the silk industry at home. In Italy, once the land of the gorgeous velvets of Genoa, the damasks and brocades of mediæval Sicily, Venice, and Florence, the centre now is at Como. Velvets are still made, however, in

165 per cent greater in quantity in 1901 than in 1895, and but 150 per cent greater in value.

Great Britain.—The earliest historical notice known to us of the silk manufacture in England is contained in an Act of Parliament passed in 1363, during the reign of Edward III., making exception to certain restrictions named in the act against merchants, shopkeepers, and manufacturers in favor of certain employments, silk being one of the number. In 1454, during the reign of Henry VI. a law was passed protecting the silk women of London against the importation of narrow silk fabrics, such as ribbons, fringes, trimmings, and embroideries. In 1463 a further act prohibited the importation of laces, ribbons, silk, fringes, and similar goods.

Value of franc and lira in United States currency, 19.3 cents.
There is a considerable interchange of silk (thrown and raw weaves), from Italy to France, Switzerland and Germany, to be dyed and finished and returned again.

The weaving of plain and figured silks is attributed to the Flemish, who settled in the country in the 16th century. The silk industry of England was greatly benefited by the revocation of the Edict of Nantes, it being estimated that 70,000 Huguenots, many of whom had been engaged in the fabrication of silks in France, sought refuge in England. There was a time, during the first half of the 19th century, when England gave every promise of becoming a very formidable rival of the silk industry in France. About 1800, the annual consumption of raw and thrown silk in England was given as 900,000 pounds, says an English writer in the 'National Review,' evidently thoroughly familiar with the facts he discusses. This quantity had increased in 1812 to 1,110,000 pounds; and by 1823 had doubled that amount. Coventry then had 7,000 working looms; Leek, 300 or 400; London, 24,000 hand looms; Macclesfield, 5,000; and Manchester probably 20,000. But internal dissensions began; disputes between weavers and masters were followed by strikes and consequent distress. The supply of silk goods was inadequate, and the demand led to wholesale smuggling. In 1826 the duties on raw and thrown silk were greatly reduced and

foreign silks were allowed to be imported at an ad valorem duty of 30 per cent. Affairs were more prosperous for awhile. The imports of raw silk rose steadily from 22,741 bales in 1830 to 112,757 bales in 1857. Meantime, in 1846, the duties on imported silk fabrics were still further reduced to 15 per cent, and the duties on raw and thrown silk were abolished. In 1852, agitation had begun for the repeal of the duties on French silks; and 27 of the silk firms of Manchester and the neighborhood memorialized the government to repeal "not partially and gradually" but "totally and immediately" the duties. Those manufacturers were prepared to meet the consequences whatever they might be; and they maintained that they were fully equal to the competition which would ensue. "Those 27 firms," the writer declares from whom these statements are taken, "have gone one and all out of existence, and from 1860, when the duties were wholly removed, the silk trade of England has suffered a painful decline. Instead of 24,000 looms in London there may be now (in 1894) 1,200; instead of 60,000 operatives, there are something under 4,000; and these figures express also the state of the trade at Manchester and Middleton combined. In 1845 there were

WORLD'S SILK INDUSTRY

850 looms in Derby; now there are 150. In 1860 there were 8,886 ribbon looms in Coventry; now there are less than 1,500. In 1851 the population of Coventry was 86,801; in 1881 it was 46,000. At Macclesfield from 1841 to 1851 there were 5,000 to 6,000 looms, which number in 30 years was reduced by one half. In Congleton in 1859 there were 40 silk throwsters, and now there are less than a dozen. This decline in manufactures is only too well corroborated by the decline in the imports of raw silk for manufacturing purposes." The total valuation of the annual import of manufactured silk from European countries in 1853 was £2,000,000, and in 1854 £2,225,000, the supply being chiefly from France. After the duty was removed by the Cobden Free Trade Act of 1860 the import rose in 1861 to £6,000,000, and in 1863 to £6,639,115. Ten years later it stood at £10,065,378. In 1894 the total value of imported silk goods footed up to over £12,000,000. In 1899 it had reached £16,100,583. The Cobden Act dispersed the silk makers of England. Very many came to the United States. They came from Spitalfields, Coventry, Macclesfield, and Manchester. During 15 years the English manufacture sustained vigorously the struggle in spite of the constant encroachment of the importation. For France alone the importation of silks, which under the regime of prohibition was valued at 5,000,000 francs, and in 1832 represented 35,000,000, next attained more than 100,000,000. During the Franco-Prussian war in 1870 the English manufacturers made some slight headway, which was lost again in 1873. Although societies have been organized, technical schools opened, and all sorts of concerted efforts are still making to get back the lost industry, no headway has thus far been observed in undoing the damage inflicted by the free trade triumph. In 1902 England appears as the greatest consumer of French silks of any foreign country. The statistics of the industry are as follows:

GREAT BRITAIN.

Number of persons employed in the silk industry decennially, from 1851 to 1901.

Year	Males	Females	Total
1851	53,936	76,787	130,723
1881	43,732	72,588	116,320
1861	29,225	53,738	82,963
1871	22,205	42,630	64,835
1891	10,098	28,937	39,035

Silk dyers, machinists, and many others whose trade depends on silk are not included in these returns, or the numbers would be much larger.

GREAT BRITAIN.

Comparative table of Board of Trade returns for imports of raw, thrown and waste silk, and manufactured silk goods—1858-60 and 1900-3.

IMPORTS		1858	1859	1860
Raw (lbs.)		6,277,576	9,920,891	9,178,647
*Thrown (lbs.)		358,269	327,462	224,335
Waste (cwts.)		16,765	20,808	17,435
Goods (value)		£ 2,111,819	£ 2,655,357	£ 3,246,119

	1900	1901	1902	1903
Raw (lbs.)	1,413,320	1,322,840	1,252,848	†1,109,930
Thrown and spun	664,641	624,859	802,964	662,677
Waste (cwts.)	60,720	48,162	55,782	66,782
Goods (value)	£ 14,281,250	£ 13,030,321	£ 13,416,400	£ 12,663,771

*There were probably no imports of spun silk at this date.

†Lowest import of raw silk since 1816.

The annual production of silk goods in Great Britain now is estimated to be about £3,000,000 or \$15,000,000. To illustrate in part the exchange of silk fabrics between the principal silk manufacturing countries of the continent and England in 1900 the following tabulation is presented:

Great Britain, imports from	1900	Great Britain, exports to
115,111,000 fcs.	France	10,282,000 fcs.
48,426,162 fcs.	Switzerland	not known
41,127,000 fcs.	Germany	2,404,800
*26,989,620 fcs.	Italy	not known
231,653,782 fcs.		

*Value estimated. The reported quantity is 385,566 kilograms of fabrics.

The value of Great Britain's export of dutiable silks, chiefly spun silk, to the United States in 1900 was \$2,534,940, and in 1903 \$1,864,021.

Austria-Hungary.—Seven eighths of the silk produced in Austria is for home consumption. The production in 1900 was 80,000,000 kronen, the exports 9,892,000 kronen, and the imports 25,990,000 kronen. Value of krone in United States currency, 20.3 cents.

Russia possesses modern silk establishments at Moscow, and the annual output of the empire (in Europe) is about \$21,000,000 in value. A special feature is the weaving of gold and silver tissues, together with brocades, for sacerdotal use and for traffic with Central Asia.

Spain produces silk goods valued at \$4,000,000 on an average. The establishments are in Barcelona, Valencia, and Grenada.

Portugal, Belgium, and Sweden, each and severally, produce a few silk goods. The total values of their products present, however, no consideration of evident importance in the world's production.

Asia and the East.—Like much else in the region of the most remote civilization, silk fabrication is left to please the imagination with its history and its modern condition. With the Turk in particular, both in Europe and in Asia, the manufactured product of silk appears to be quite an unknown quantity. He uses most of it himself. His looms are primitive and the designs are very oriental. It is not easy to estimate the amount of silk goods produced. There are no statistics given under official authority which can be obtained. The annual imports of silk fabrics are about \$3,000,000. The domestic production is possibly one half that amount.

India.—The silk industry of India is known chiefly by the foulards, or corahs, sent to Eu-

WORLD'S SILK INDUSTRY

rope. Benares and its district form the most important centre of the manufacture, though silk is made in nearly all the provinces of India. The industry is largely for domestic consumption; and, it should be added, less goods are produced at a low price than formerly, because the population has adopted the use of cottons and woollens made in England. Silks have become more exclusively for the rich. The manufacture in India of silk mixed with other stuffs is said to be considerable.

In British India great attention has been given in recent years to raising native or Tussah silk. The most improved reeling processes and highly skilled reelers are employed, but the ex-

port output cuts no commercial figure of importance at this writing outside of about 600,000 pounds annually to England, France, and Italy.

China.—In all the villages of the great empire there are dense populations composed of artisans and agricultural laborers. With these the weaving of silk in the household has been practised from generation to generation. No official statistics are collected of their products. In 1883 it was estimated that the number of looms should be at least reckoned at 350,000, and the product at 300,000,000 francs, or \$60,000,000. The exports include taffetas, foulards, satins, serges, and crepes; but it was reported, after the sacking of the summer palace

WORM-EATING WARBLER — WORMELEY

of the emperor during the war in 1894, that the Chinese manufacture of silks and velvets was displayed in a way not familiar to the European. The best of everything had been retained within the empire. It was estimated in 1902, that the Chinese silk industry consumes annually about 18,600,000 pounds of raw silk, or say 55 per cent of the estimated production by China. This estimate would indicate a probable annual value of production of silk stuffs in China of \$70,000,000 or upward.

Japan.—In Japan silk factories are established in many provinces. The greatest number are in Kioto, in the province of Yamashiro, notable for taffetas, brocades, and crepes. Next in rank is Kiriu in the province of Joshu, Gunma prefecture. Published statistics in 1900 stated that there were 382,000 hand looms employed in the several textile industries in Japan. Among these, though details are not given, it was estimated the silk looms numbered 40,000. Half of the output was attributed to Kioto, and one quarter to Kiriu. Like Italy, Japan devotes more attention to raising silk than to manufacturing the raw product. In December 1902 an estimate placed the production of Japan at 16,093,580 pounds, and the domestic consumption at 6,613,800 pounds, or say 41 per cent of the production. According to the returns of the Department of Agriculture and Commerce of Japan in 1903, the raw silk production of Japan in 1902 was 10,940,169 kin (1,3225 pounds), say 14,468,373 pounds. The amount reported as exported was 8,697,706 kin, showing a domestic consumption of say 3,000,000 pounds in that year. Undoubtedly there is a considerable quantity of waste silk entering into the production of silk tissues in Japan, for the reported production of silk tissues in 1902 amounts to 76,041,003 yen, say \$38,316,619. The output of production of silk tissues in the four largest weaving dis-

tricts amounted in 1902 to \$23,591,880. The exports of silk tissues in the same year amounted to \$15,627,653. We must therefore conclude that the reported production of raw silk, and of noshi waste, etc., are understated in the accompanying official reports, for the reason that the actual production is beyond the reach of the statistical authorities of Japan. The latest returns regarding the silk trade of Japan, production, exports, and imports, are appended.

See SILK, MANUFACTURE OF.

FRANKLIN ALLEN, C. P. A.,

Secretary Silk Association of America.

Worm-eating Warbler, a small, ground-keeping warbler (q.v.) of the United States (*Helminthos vermivorus*), breeding commonly in the woods of the eastern part, and migrating in winter to Central America. It is 5½ inches long, olive-green above, yellowish-white below, the distinguishing specific mark being three black stripes on the buffy crown. Its song is a faint thrill, heard most often in hilly woodlands, where the bird hunts for caterpillars and similar food among the lower branches of the bushes or upon the ground. Its nest is constructed with great skill in some little natural cavity of a hillside, and is cleverly hidden under an arch of twigs and old leaves, so disposed as to well conceal the white, red-speckled eggs. The mother uses the trick common to so many ground-building birds, of feigning lameness, fluttering ahead of the intruder in a frantic attempt to draw him away from the nesting-place in vain pursuit of herself.

Worm-seed, the flower-heads of certain species of *Artemisia* (q.v.) used as a vermifuge. See also ERYSIMUM; GOOSEFOOT.

Worm-shell, one of the curiously uncoiled and distorted gastropod mollusks of the marine family *Vermetida*, whose shells might easily be mistaken for the tubes of annelids, such as *Serpula*. They are free and spiral in early life, and crawl about like ordinary gastropods, but they afterward settle down and become attached to stones, etc., for the remainder of their lives. The animals are worm-like, with a short proboscis, horny jaws and radula, and two short tentacles. When they become stationary the foot, being of no further use as a locomotive organ, becomes modified into an organ of attachment, and the shell stretches out irregularly. The species are not numerous and occur mainly within the tropics.

Wormeley, wèrm'li, Katharine Prescott, American author and translator: b. Ipswich, England, 14 Jan. 1830. She was the daughter of an English rear admiral and a niece of Commodore Edward Preble of the American navy, and came to the United States in girlhood. She was engaged in the relief of Union soldiers during the Civil War and was connected with the United States Sanitary Commission. She is most widely known as a translator of Honoré de Balzac's novels in 40 volumes (1883-97); of Molière in 6 vols. (1892); and of the Duc de Saint-Simon's 'Memoirs' (1898-1901); and is the author of 'Letters from Headquarters during the Peninsular Campaign' (1862); 'The Other Side of War' (1888); 'Life of Balzac'; 'The United States Sanitary Commission' (1863).

SUMMARY OF WORLD'S PRODUCTION AND CONSUMPTION OF RAW SILK FOR THE YEAR 1902:

COUNTRIES	Production Pounds	Consumption Pounds
Europe — France	1,543,220	8,818,400
Italy	9,726,695	2,204,600
Switzerland	110,230	3,417,130
Spain	180,777	440,920
Austria	449,738	1,598,335
Hungary	253,529
Russia and Caucasus	881,840	3,086,440
Bulgaria, Servia, Rumania	194,005
Greece and Crete	132,276	33,069
Salonica, Adrianople	440,920
Germany	6,172,880
England	1,763,680
America — United States	10,802,540
Asia — Bruttia	881,840	110,230

China, Canton	8,818,400	4,400,200
Japan	16,093,580	6,613,800
India	2,645,520	3,086,440
Tonquin and Annam	2,204,600	1,984,140
Africa — Egypt	396,828
Tripoli and Morocco	220,460
Algeria and Tunis	165,345
Other countries and balance	1,313,941
Total	72,952,418	72,952,418

N. B.—Chinese Tussah silks are included.

WORMS—WORT

Worms, vörms, Germany, a town of Hesse-Darmstadt, on the Rhine, nine miles northwest of Mannheim. The town is irregularly built and has remains of its mediæval walls and ramparts. Its principal building is the cathedral, completed and consecrated in 1101, a noble Romanesque structure with four elegant towers, two domes, a double choir, and a flamboyant 15th century Gothic portal. The interior is 357 feet long, 87 feet wide, across the transepts 117 feet, and is very imposing from its grand simplicity. On the north side of the cathedral is the site of the Bischofshof or episcopal palace, the seat of the celebrated Diet of Worms in April 1521. It was destroyed by the French in 1689, and again in 1794. On its massive red sandstone substructure the Heil'sche Haus has been erected in the rich Renaissance style. The restored church of Saint Martin, and the Church of Saint Paul secularized as a museum, are also of notable ecclesiastical architecture. Outside the town stands the Liebfrauenkirche (dating from the 15th century), which gives its name to the Liebfrauenmilch, a much-esteemed wine grown in the vicinity. The finest monument in Worms is that to Luther, erected from Rietschel's designs in 1868 at a cost of \$85,000. Worms is a considerable river port with a good harbor and an active shipping trade. The principal industries of Worms are the manufacture of patent leather, tobacco, beer, soap, and amber wares. Worms is one of the most historical towns of Germany. It was known to the Romans as Borbetomagus, and later as Augusta Vangionum, the capital of the Vangiones. It was destroyed by Attila and rebuilt by Chlodwig in 486. After the partition of the empire among the sons of Ludwig the Pious, Worms became a German free town under the protection of the Elector of the Palatinate. Already in 1255 it belonged to the Confederation of Rhenish towns, and it contained in the time of Frederick Barbarossa 70,000 inhabitants. It was the seat of many Imperial Diets, most famous that under Karl V., which Luther made memorable to the world. In 1632 the suburbs of the town were leveled by the Swedish Colonel Haubold, and in 1689 the town itself was ruthlessly destroyed by Melac and the young Duc de Créquy under the orders of Louis XIV. In September 1792 part of it was leveled by the French under Custine; at the peace of Lunéville in 1801 it was given to France. The peace of Paris in 1814 gave it back to Germany, and the Vienna Congress in 1815 to Hesse-Darmstadt. Pop. (1900) 40,714.

Worms, any of many elongated jointed animals; the term has no more definite signification or limits than has Vermes (q.v.). Examples of what may most properly be called worms are earthworms, leeches, marine annelids, and the parasitic flatworms, roundworms, etc., especially such as infest the intestinal tract. These are described elsewhere, under their names. See also PARASITES.

Wormwood, a perennial herb (*Artemisia absinthium*) of the order Compositæ. It is a native of Europe and northern Asia, whence it has been introduced into other countries by way of gardens in which it was formerly cultivated for domestic medicine. The plant grows about three feet tall, is spreading, bears silky, pinnatifid leaves and yellow flowers in heads

arranged in racemes. All parts of the plant are intensely bitter, on which account they, the leaves especially, have been used for flavoring drinks. Wormwood is cultivated to some extent for the manufacture of absinthe (q.v.), of which it forms one of the most important ingredients and which is named from it. See ARTEMISIA.

Wor'num, Ralph Nicholson, English art critic: b. Thornton, Northumberland, 29 Dec. 1812; d. Hampstead, Middlesex, 15 Sept. 1877. He was educated at University College, London, and between 1834 and 1839 studied painting and the fine arts in the principal continental cities. Having practised portrait painting for some years in London, he devoted himself principally to the literature of his profession. In 1848 was appointed lecturer on ornamental art in the government schools of design, and in 1852 librarian and keeper of casts in the department of art into which they were constituted. In 1855 he was made keeper and secretary of the National Gallery. He published 'History of Painting, Ancient and Modern' (1847); 'Epochs of Painting' (1860); 'Analysis of Ornament' (1856); 'Life and Works of Hans Holbein' (1867).

Woronzoff, vör'ön-zof, Michael Semenovitch, PRINCE, Russian statesman and general: b. Moscow 17 May 1782; d. Odessa 18 Nov. 1856. He was educated in England, where his father was Russian ambassador, entered the Russian army in 1801, served against the Turks, and distinguished himself in the war with France. He was severely wounded at Borodino and commanded the cavalry at the battle of Leipsic in October 1813. Ten years later he was named governor of New Russia and Bessarabia, and in 1844 governor of the Caucasus. He carried on the war with the mountain tribes, and took Shaml's stronghold, Dargo, 18 July 1845.

Worship, the act of paying divine honors to the Supreme Being; or the reverence or homage paid to Him in religious exercises, consisting in adoration, confession, prayer, thanksgiving, and the like. The homage paid to idols or false gods by pagans; idolatry of inferiors. Obsequious or submissive respect; unbounded admiration; as, hero worship. Also a title used in Great Britain and some British colonies in addressing certain magistrates. See RELIGION.

Worsted, wust'əd or wūr'stəd, are varieties of woolen yarn or thread, spun from long-staple wool which has been combed, and which in the spinning is twisted harder than ordinary. It is knit or woven into stockings, carpets, etc. The name is derived from Worsted, a village in Norfolk, where it is supposed to have been first manufactured. See TEXTILE INDUSTRIES, AMERICAN.

Wort, the saccharine liquid obtained by the action of malt on a mixture of water and crushed barley, corn, or other grain, the whole being known as the "mash." The water extracts the maltose and dextrine from the malt and allows the diastase to act on the starch of the grain, changing it also to maltose and dextrine. The pectase of the malt at the same time changes the grain proteids to soluble peptones. Care must be taken of the temperature and the dilution of the mash in order to obtain the best results. Worts are of various kinds, depending

WORTH — WOTTON

on the grain used and the temperature given it. Some are fermented to beer, ale, porter, and like beverages, while other forms are fermented to a mash that is distilled for alcohol or whiskey.

Worth, wërth, Charles Frederick, Anglo-French dressmaker: b. Bourne, Lincolnshire, England, 1825; d. Paris 11 March 1895. Removing to Paris in 1846, he started there an establishment for the making of fashionable costumes. He was eminently successful as a designer and his establishment in the Rue de la Paix became the leading emporium of fashion for Europe and the United States, employing 1,200 persons.

Worth, William Jenkins, American general: b. Hudson County, N. Y., 1 March 1794; d. San Antonio, Texas, 7 May 1849. He received an ordinary education, and when the War of 1812 broke out enlisted as a private soldier, rising to the rank of captain in 1815. He was instructor of infantry tactics and commander of cadets at West Point 1820-8 and in 1838 became colonel of the 8th infantry. In 1840 he was sent to serve in the war against the Florida Indians, and in 1841 took the chief command. He was successful in repeated and severe conflicts with the savages, whereby the war was brought to a close, and in August 1842 was brevetted a brigadier-general for gallantry and distinguished services. In the war with Mexico, at the battle of Monterey 23 Sept. 1846, he bore a very important part. As it was impossible to communicate with the commander-in-chief, Worth was obliged to act independently throughout the battle. He carried the forts commanding his line of approach, stormed the bishop's palace, and had fought his way through the streets nearly to the great plaza, when the town capitulated to Taylor, approaching from the other side. For these achievements Worth was brevetted a major-general, and received a sword from Congress. He was also distinguished at Cerro Gordo, Puebla, Churubusco, Molino del Rey, and at the storming of the City of Mexico. A monument was erected to his memory by the city of New York, at the junction of 5th Avenue and Broadway, where his remains are interred.

Worth, William Scott, American general: b. Albany, N. Y., 6 Jan. 1840; d. Clifton, S. I., 16 Oct. 1904. Entering the Union army as 2d lieutenant in 1861, he became captain in 1866; lieutenant-colonel of the 13th infantry in 1894, and colonel in September 1898. He accompanied the army to Cuba, and during the assault on San Juan Hill, 1 July 1898, was severely wounded. He was promoted brigadier-general, U. S. A., in the following November, and was retired a week later.

Wörth, vërt, Germany, a village in Alsace, at the confluence of the Sauerbach and Sulzbach rivers, 10 miles southwest of Weissenburg. It is celebrated as the place where the French on 6 Aug. 1870 met their first great defeat in the Franco-German war (q.v.).

Worthen, wër'then, William Ezra, American civil engineer: b. Amesbury, Mass., 14 March 1819; d. New York 2 April 1897. After graduation from Harvard in 1838, he began the practice of civil engineering, and until 1848 was employed chiefly with surveys connected with the Boston water-supply, and in other hydraulic works. He designed and constructed several

mills in Lowell, in 1849 began architectural work in New York, was made engineer of the New York & New Haven railway, and in 1854 its vice-president. After 1854 he was busily employed as a practising and consulting engineer, being frequently retained as an expert in matters relating to the planning, construction, or improvement of sewage and water systems. He was chief engineer of the first rapid transit commission of New York, and in 1890-1 chief engineer of the Chicago main drainage canal. In 1887 he was president of the American Society of Civil Engineers. Besides official reports, he published: 'Cyclopædia of Drawing' (1857); 'First Lessons in Mechanics' (1862); and 'Rudimentary Drawing for Schools' (1863).

Worthing, wër'thing, England, a watering-place in Sussex, 12 miles west of Brighton; with good streets, handsome terraces, crescents, and villas, splendid hotels, baths, smooth sands, a beautiful esplanade, libraries, a literary institution, reading-rooms, and assembly-rooms. Fruit-growing is an important industry of the town. Pop. (1901) 20,006.

Worthington, wër'thing tòn, George, American Protestant Episcopal bishop: b. Lenox, Mass., 14 Oct. 1840. He was graduated from Hobart College in 1860 and from the General Theological Seminary in 1863. He took priest's orders in 1864, was rector of St. John's Church, Detroit, 1868-85, and was consecrated bishop of Nebraska in 1885.

Worthington, Henry Rossiter, American inventor: b. New York 17 Dec. 1817; d. Tarrytown, N. Y., 17 Dec. 1880. In 1840 he began a series of experiments with steam for the propulsion of canal boats, soon afterward devised a small steam pump to be used in the maintenance of the water supply in the engine boiler, and in 1841 patented an independent feed pump which developed into the direct-acting steam pump that he patented in 1849. Subsequently he built in Savannah, Ga., the first direct-acting compound-engine ever used in waterworks; invented the duplex pump, and devised various improvements in steam and hydraulic machinery.

Worthington, Minn., village, county-seat of Nobles County; on the Burlington, C. R. & N. and the Chicago, M., St. P. & O. R.R.'s; nearly 100 miles northeast of Sioux City, Ia. It is in an agricultural section. It has flour mills, grain elevator, stock-yards, and machine shops. The three banks have a combined capital of \$125,000. The village has a high school established in 1883, and a public library. Pop. (1890) 1,164; (1900) 2,386.

Wotton, wõt'òn, Sir Henry, English diplomat and poet: b. Boughton Malherbe, Kent, 30 March 1568; d. Eton December 1639. He was educated at Oxford, and having studied civil law under an eminent Italian professor, became proficient in the Italian language. He visited all the principal countries of the Continent 1589-97, and on his return was secretary to the Earl of Essex. On the fall of that nobleman he went to Florence, where he composed a treatise, printed after his death, entitled 'The State of Christendom.' The Grand Duke of Tuscany having intercepted some letters disclosing a plot to take away the life of James, king of Scotland, engaged Wotton to carry secret intelligence of it to that prince. This service he ably per-

WOULFE'S BOTTLE — WOUND

formed in the character of an Italian, and when James came to the English crown he sent for Wotton, knighted him, and in 1604 employed him as an ambassador to the Republic of Venice. As Wotton passed through Augsburg, being desired to write in an album, he wrote in Latin that "an ambassador is a good man, sent to lie abroad for the good of his country." This innocent sally was represented as a state maxim sanctioned by the religion of the king of England. James, who thought nothing relative either to king-craft or state-craft a subject for wit, was highly displeased; and on his return Wotton had to make humble apology. At length he recovered the royal favor, and was restored to his former post at Venice (1616-19). Other missions followed, and in 1624 he was made provost of Eton College. The first-fruits of his leisure were his 'Elements of Architecture.' A collection of miscellanies was published after his death entitled 'Reliquiæ Wottonianæ.' This collection includes several poems by Wotton, of which two, 'The Character of a Happy Life' and 'On His Mistress, the Queen of Bohemia,' are among the finest lyrics in the English language. Consult 'Lives' by Izaak Walton (1651) and A. W. Ward (1899).

Woulfe's Bottle, in chemistry, a bottle devised by a London chemist, Peter Woulfe (1806). It has two or more separate necks and is used by chemists when it is necessary to have more than one glass tube leading into or from the bottle.

Wound, in surgery, a solution of continuity of any tissue or soft part of the body. Wounds are divided by writers on surgery into several kinds, the distinctions being founded either upon the sort of weapon with which the injury has been inflicted; upon the circumstance of a venomous matter having been introduced into the part; or upon the nature of the wounded parts themselves, and the particular situation of the wound. Hence we have cuts, incisions, or incised wounds, which are produced by sharp-edged instruments, and are generally free from all contusion and laceration. The fibres and texture of the wounded part have suffered no other injury but their mere division; and there is, consequently, less tendency to inflammation, suppuration, gangrene, and other bad consequences than in the generality of other species of wounds. Another class of wounds are stabs, or punctured wounds, made by the thrusts of pointed weapons, as bayonets, lances, swords, daggers, etc., and also by the accidental and forcible introduction of considerable thorns, nails, etc., into the flesh. These wounds frequently penetrate to a great depth so as to injure large blood-vessels, viscera, and other organs of importance; and as they are generally inflicted with much violence the parts suffer more injury than what would result from their simple division. Many instruments by which punctured wounds are made increase in diameter from the point, and when they penetrate far they force the fibres asunder like a wedge, and cause serious stretching and contusion. Bayonet wounds of the very soft parts are ordinarily followed by violent inflammation, tumefaction, large abscesses, fever, delirium, etc. A third description of wounds are the contused and lacerated, which strictly comprehend, together with a variety of cases produced by the violent

application of hard, blunt, obtuse bodies to the soft parts, all those common injuries called gunshot wounds (q.v.). Many bites rank also as contused and lacerated wounds. In short, every solution of continuity which is suddenly produced in the soft parts by a blunt instrument or weapon which has neither a sharp point nor edge must be a contused, lacerated wound.

Poisoned wounds are those which are complicated with the introduction of a venomous matter or fluid into the part. Such are the stings and bites of a variety of insects, and the surgeon, in the dissection of putrid bodies, or in handling instruments infected with any venomous matter, is exposed to the danger of poisoned wounds from cuts. The most dangerous, however, of this class of wounds occur from the bites of the viper, the rattlesnake, etc., or from those of rabid animals. (See HYDROPHOBIA.) Wounds may likewise be universally referred to two other general classes, the simple and complicated. A wound is called simple when it occurs in a healthy subject, has been produced by a clean, sharp-edged instrument, and is unattended with any serious symptoms. A wound, on the contrary, is said to be complicated when the state of the system, of the wounded part, or the wound itself, indicates the necessity for more complex treatment than the simple reunion of the cut surfaces. The differences of complicated wounds must therefore be very numerous, as they depend upon many incidental circumstances, the principal of which, however, are hemorrhage, nervous symptoms, contusion, the unfavorable shape of the injury, the discharge or extravasation of certain fluids, indicating the injury of particular bowels or vessels, etc. All large or deep wounds are attended with more or less of symptomatic fever, which usually comes on at a period varying from 16 to 36 hours after the infliction of the injury, and is generally of the inflammatory, but sometimes of an asthenic character. The liability to gangrene is also a formidable danger to be guarded against in the treatment of complex wounds.

In incised wounds the first thing to be attended to is to stop the hemorrhage. This is usually accomplished by simply bringing the edges of the wound together; but if any of the larger blood-vessels have been injured, pressing the trunk by means of a bandage or tourniquet will be necessary; and should this not succeed, the vessels must be secured with ligatures. Next, care should be taken that all extraneous substances are removed from the wound. Then the edges of the wound are to be brought together, and retained either by straps of adhesive plaster, or in some situations by one or two stitches. Generally such wounds heal very quickly, without any suppuration, "by first intention." When, however, this is not the case, and suppuration comes on, all attempts to procure union by first intention should be abandoned, the plasters and bandages removed, poultices and warm dressings used to remove inflammation, and afterward healing ointment applied. Lacerated and contused wounds require to be similarly treated; but they heal less kindly, and suppuration almost always takes place. The swelling and inflammatory symptoms which commonly attend contused wounds are to be diminished by cooling lotions or emollient poultices. Punctured wounds are dangerous from their depth;

WOUWERMAN — WRANGEL

and the internal effusion of serum and blood which usually attends them. They are frequently also followed by severe inflammation and suppuration. The same general principles apply in this case, too. Sometimes it may be necessary to enlarge the wound a little, so as to remove the stretching of the parts, and to lessen the inflammation; leeches and fomentations are often required. In poisoned wounds free incisions, and even amputation may often be necessary.

Wouwerman, wow'vēr-mān, **Philips**, a Dutch painter: b. Haarlem 1620; d. there 19 May 1668. He was instructed by his father, an indifferent artist, and by Wynants of Haarlem, in which city his life was passed. According to the commonly received account, his reputation as a painter during his life was small. After his death his pictures rose immensely in value, and he is now one of the most esteemed painters of the Dutch school. In consequence, it is said, of the disgust with which this neglect inspired him, he destroyed before his death all the studies he had made during his life, from fear that his son might be induced by the possession of them to become a painter. His subjects consist for the most part of roadside scenes and hunting or battle pieces, and it is commonly believed that he never painted a picture without a white or gray horse as a conspicuous object. His technical qualities are of a high order, and his skies, foregrounds, and foliage are executed in the best style of his school. He left upward of 800 carefully finished pictures. Those offered for sale always fetch high prices, and in 1892 his 'Halt of a Sporting Party' was sold for \$18,375. The best collection of his works is in the Royal Gallery of Dresden. There are also fine examples in the Louvre, and in Munich, Vienna, St. Petersburg, Amsterdam, The Hague, Rotterdam, etc.

Wrack, or **Sea-wrack**, a name applied to sea-weeds of various species, which, having been uprooted during storms, are carried to shore and there left by the tide. Wrack, when reduced to ashes, furnishes an alkali known as kelp, employed in the manufacture of glass and soap; it is now, however, little used for that purpose, having been supplanted by barilla (q.v.). The alkali of sea-weeds supplies the chemical substance iodine (q.v.). The salt contained in wrack makes it of value as a fertilizer, and it is largely gathered as such in some agricultural districts. From portions of the Japanese coast it is exported to the interior of China, where salt is not abundant.

Wrangel, vräng'ēl, or **Wrangell**, **Ferdinand Petrovitch**, **BARON**, Russian naval officer and explorer: b. Livonia 9 Jan. 1795; d. Dorpat 6 June 1870. He studied at the Naval Academy, St. Petersburg, and in 1820-4 directed a Polar expedition to explore the coast of eastern Siberia and the region north of Asiatic Russia. By sledge-journeys undertaken in 1822 and 1823 he reached lat. 72° 2' N., but he found no trace of the reported land for which he was searching. This was discovered by G. W. De Long (q.v.) in 1867, and is now known as Wrangel Land (q.v.), though taken possession of for the United States as "New Columbia" by Hooper in 1881. In 1829-34 Wrangel was governor-general of Russian America, and in 1840-9 director of the Russian-American Company. He

attained vice-admiral's rank in the navy. In 1855-8 he was acting minister of marine, and subsequently a councillor of state. He opposed the sale of Russian America to the United States. His account of his Polar expedition appeared in Russian in 1841. An account in German was prepared from Wrangel's journals (1839), and of this an English translation was made by Sabine, 'Wrangell's Expedition to the Polar Sea' (1840). Consult Von Engelhardt, 'Ferdinand von Wrangel und seine Reise' (1885).

Wrangel, **Friedrich Heinrich Ernst**, **COUNT**, German soldier: b. Stettin 13 April 1784; d. Berlin 1 Nov. 1877. He became ensign in a Prussian regiment of dragoons in 1796, took part in the campaigns of defense against Napoleon, and rose to be successively colonel (1815), major-general (1823), and lieutenant-general (1838). At the outbreak of the war of 1848-50 with Denmark he was made general of cavalry and commander of the allied forces in Schleswig-Holstein. Victorious at Schleswig (23 April 1848), he entered Jutland, but withdrew in September from the chief command, and later quelled the insurrection in Berlin. In 1856 he was promoted field-marshal. He was appointed generalissimo in the war of 1864 with Denmark, but retired after the storming of the lines of Düppel (18 April).

Wrangel, **Karl Gustaf von**, **COUNT**, Swedish general: b. Skokloster, on Lake Maelar, 13 Dec. 1613; d. Isle of Rugen 24 June 1675. He accompanied Gustavus Adolphus in his expedition to Germany, and at the battle of Lutzen, in 1632, rendered great services after the fall of the king. In 1641 he was one of the major-generals who commanded the Swedish forces until the arrival of Torstenson, and under him participated in the campaign in Germany, and the famous march to Holstein. After the death of Flenning in 1644 he received the supreme command of the Swedish fleet, and obtained over the Danish fleet a great naval victory on 13 October, between the islands of Femern and Laaland. In 1646 he succeeded Torstenson as commander-in-chief of the Swedish army, effected a junction at Giessen with the French forces under Turenne, with whom he crossed the Main and besieged Augsburg, which, however, was relieved by the Austrian army. In 1648 the Swedes and French defeated the Austrians and Bavarians near Zusmarshen, but retired before the army of Piccolomini. Wrangel commanded under Charles X. in the campaigns in Poland (1655) and Denmark (1657-9), and in 1674 led an army of 16,000 men into the electorate of Brandenburg.

Wrangel (räng'gēl) **Land**, or **New Columbia**, an island in lat. 71° N., and lon. 180° W.; in the Arctic Ocean; about 100 miles off the coast of Siberia and 300 miles from the coast of Alaska. It is about 75 miles long and 20 miles wide. It consists chiefly of bare rocks which rise to a height of 2,000 feet. At the base and in places near the shore line there is some vegetation. The first mention of an island in this locality was made about 1810, and in 1821 Ferdinand Baron Wrangel (q.v.), the Russian explorer, commanded an expedition in search of this land. Long, the American explorer, sighted the island in 1867, and Hooper, also an American, visited it in 1881, and took posses-

sion of it for the United States. He named the island New Columbia.

Wrangell, Alaska, village, on Wrangell Island, near the mouth of the Stikine River; about 170 miles southeast of Juneau, and 120 southeast of Sitka. A settlement was made here by Russians in 1833. It is a trading post for fish and furs. It has a hatchery, salmon canneries, and storehouses. It is a distributing centre for mining camps and interior trading post. Pop. (1890) 316; (1900) 868.

Wrangler, Senior, a term applied in the University of Cambridge, England, to the undergraduate who passes the best public mathematical examination for the bachelor's degree. The candidates for honors are arranged in order of merit in three lists or classes, of which the highest is called that of wranglers, the next that of senior optimes, and the lowest that of junior optimes—the whole constituting what is known as the mathematical tripos. Hence the senior wrangler, or the highest in the list of wranglers, is the most distinguished mathematician of the year.

Wrasse, a fish of the family *Labridæ* (q.v.).

Wrattislaw, rät'sis-lä, **Arthur Henry**, English scholar; b. England of Bohemian parentage about 1822; d. 1892. He was graduated from Cambridge in 1844, was headmaster of Felstead grammar school 1849-57, and of that at Bury St. Edmunds 1857-79, and was vicar of Manorbier, Pembrokeshire, Wales, 1879-87. He was the leading Slavonic scholar of his day in England, and among the important of his publications are: 'Lyro Czecho-Slavonska' (1849); 'The Queen's Court MSS. with Other Ancient Bohemian Poems' (1852); 'Life, Legend, and Canonization of St. John Nepomuk' (1873); 'Native Literature of Bohemia in the 14th Century' (1878); 'Sixty Folk Tales from Slavonic Sources' (1889).

Wraxall, räk'sal, **Sir Nathaniel William**, English historian; b. Bristol 8 April 1751; d. Dover, Kent, 7 Nov. 1831. He was in the East Indian Civil Service 1769-72, and during the course of some seven years of foreign travel was a confidential agent of Queen Caroline Matilda of Denmark to her brother George III. (1774-5). He published 'Cursory Remarks Made in a Tour' (1775); 'Memoirs of the Valois Kings' (1777); 'History of France from Henry III. to Louis XIV.' (1795); 'Memoirs of the Courts of Berlin, Dresden, Warsaw, and Vienna' (1799), and the famous 'Historical Memoirs of My Own Time, from 1772 to 1784' (1815). For a libel in the last on Count Woronzov, Russian envoy to England, Wraxall was fined \$2,500 and sentenced to six months' imprisonment. He is an amusing writer, but his veracity has been many times questioned. He sat in Parliament for 14 years from 1780 and was knighted in 1813. Consult his 'Posthumous Memoirs,' continued from 1784 to 1790 (1836).

Wray, John. See RAY, JOHN.

Wreck, the destruction of a ship by being driven ashore, dashed against rocks, foundered by stress of weather, or the like; shipwreck (q.v.).

Wreck of the Grosvenor, *The*, a story by William Clark Russell, published in 1874. This tale of the British merchant marine is notable among sea novels for its fidelity to the life por-

trayed. The chief value of the book lies in its dealing in a plain, straightforward manner, and without exaggeration, with some of the most glaring evils of the mercantile marine. Events like those recorded in its pages are familiar to every man who sailed the seas during the middle and even the latter part of the 19th century, and they show to what an extent the power given by the law may be abused when placed in the hands of ignorant and brutal officers. 'The Wreck of the Grosvenor' is said to have been a powerful factor in reforming the laws relating to the merchant seamen in Great Britain.

Wreckage, in navigation, is usually understood to mean any ship or goods driven ashore or found floating at sea in a deserted or unmanageable condition. In law, wreckage is defined as such articles of value as are cast upon land by the sea, and includes jetsam, flotsam, ligan, and derelict. In most countries any person found stealing or destroying any wreck is chargeable with felony; and a person proved to be in possession of shipwrecked goods, or who offers such goods for sale, may be fined or imprisoned.

Wrede, vrä'dë, **Karl Philipp**, PRINCE, Bavarian field-marshal; b. Heidelberg 29 April 1707; d. Ellingen, Bavaria, 12 Dec. 1838. He was educated at the University of Heidelberg in his 25th year, became assessor to the high court of Heidelberg, and on the outbreak of war between France and Austria civil commissary for the palatinate in the Austrian army. He not only discharged the functions of this office for five years, but took part in the military operations, and in 1795 became a colonel. On 3 Dec. 1800 he was engaged in the battle of Hohenlinden, where he had the rank of major-general, and after the battle covered the retreat of the defeated Austrian army. He was appointed to the chief command of all the Bavarian forces in the field in 1805, and in the campaign of that year, owing to the Franco-Bavarian alliance, fought on the side of his former foes. He participated in the battle of Wagram (6 July 1809), his services on this occasion being rewarded with the grade of field-marshal and the title of count. In 1812 he accompanied Napoleon in his fatal Russian campaign as commander of the Bavarian cavalry, and in October 1813, after Bavaria had been detached from the French alliance, at the head of 170,000 men, attempted to cut off the retreat of Napoleon, who had been defeated at Leipsic, but was defeated at Hanau. In 1816 he was created a prince, and the estate of Ellingen conferred upon him.

Wren, rën, **Sir Christopher**, English architect; b. East Knoyle, Wiltshire, 20 Oct. 1632; d. Hampton Court, Berkshire, 25 Feb. 1723. He entered as a student at Wadham College, Oxford, in 1646, having previously given proofs of genius by the invention of astronomical and pneumatic instruments. In 1647 he wrote a treatise on spherical trigonometry upon a new plan, and the following year composed an algebraical tract on the Julian period. He was one of the earliest members of the Philosophical Society at Oxford, which was the origin of the Royal Society, after the institution of which, in 1663, he was elected a fellow, and distinguished himself by his activity in promoting the

objects of that institution. In 1657 he was appointed professor of astronomy at Gresham College, but, being nominated to the Savilian professorship of astronomy at Oxford, resigned the former office, and in 1661 returned to the university. He received a commission, in 1663, to prepare designs for the restoration of St. Paul's Cathedral, then the largest Gothic edifice in the kingdom. While his designs were under consideration the cathedral was destroyed by the fire of 1666, and Wren had now an opportunity for signalizing his talents by the erection of an entirely new structure. In 1668 he succeeded to the office of surveyor of works, resigned his Savilian professorship in 1673, in 1674 received the honor of knighthood; and in the following year the foundation of the new cathedral was laid. In 1680 he was chosen president of the Royal Society. In 1683 he was appointed architect and one of the commissioners of Chelsea College; and the following year controller of the works at Windsor Castle. He was elected member of Parliament for Plympton in 1685, and to his public trusts were added, in 1698, that of commissioner for the repair of Westminster Abbey, and, in 1699, that of architect of Greenwich Hospital. In 1700 he represented in Parliament the boroughs of Weymouth and Melcombe Regis. In 1708 he was made one of the commissioners for the erection of 50 new churches in and near the city of London. After having long been the highest ornament of his profession he was, in 1714, deprived of the surveyorship of the royal works from political motives. He was then in the 85th year of his life, the remainder of which was devoted to scientific pursuits and the study of the Scriptures. His remains were interred under the choir of St. Paul's Cathedral; and over the choir entrance was placed the following inscription (since removed to another part of the church):

Subtus conditur
Hujus Ecclesiae et Urbis Conditor,
Christ. Wren;
Qui vixit Annos ultra nonaginta,
Non sibi sed Bono publico.
Lector, si Monumentum quaeris,
Circumspice.

(Beneath is laid the builder of this church and city, who lived above ninety years, not for himself but for the public good. Reader, if thou seekest his monument, look around.)

The edifices constructed by Wren were principally public, including a royal hunting seat at Winchester, and the modern part of the palace at Hampton Court. Some of the most remarkable of his buildings, besides St. Paul's, are the monument on Fish Street Hill, the theatre at Oxford, the library at Trinity College, Cambridge; the hospitals of Chelsea and Greenwich; the church of St. Stephen's, Walbrook; those of St. Mary-le-Bow, St. Michael, Cornhill, and St. Bride, Fleet Street; and the great campanile of Christ Church, Oxford. The Royal Exchange and Custom-house, since destroyed by fire and re-erected, were among his works. As an architect he possessed an inexhaustible fertility of invention combined with good natural taste and profound knowledge of the principles of his art. His talents were particularly adapted to ecclesiastical architecture, but in his palaces and private houses he sometimes achieved monotonous results, as at Hampton Court. The interior of the church of St. Stephen's, Walbrook, which has been considered as his *chef-d'œuvre*, exhibits a deviation from common

forms equally ingenious and beautiful, and St. Paul's Cathedral may be fairly reckoned among the most magnificent productions of architectural genius. Yet the works of Wren have not passed without censure. Even in St. Paul's, while the grandeur of the whole work is admitted, many faults, and especially waste of interior space, are charged against him. Consult: 'Parentalia, or Memoirs of the Family of the Wrens' (1750); Elmes, 'Sir Christopher Wren and His Times' (1823); Clayton, 'Churches of Sir Christopher Wren' (1848); Milman, 'Annals of St. Paul's Cathedral' (1868); 'Life' by Phillimore (1883); Loftie, 'Inigo Jones and Wren' (1893); Marshall, 'Under the Dome of St. Paul's' (1899); Dimock, 'Handbook of St. Paul's Cathedral' (1900).

Wren, a family (*Troglodytidae*) of passerine birds, having a slender, slightly curved, and pointed bill, with the exposed nostrils partly concealed by a scale, the wings very short and rounded, with nine well developed and the first short primaries, the tail short, and often carried erect; the legs are robust and rather long. They are abundant in the neotropical region, less common in the nearctic, and only a few occur in the Old World in Europe, Asia, and Sumatra, those of the latter region being more or less aberrant. The known species exceed 100 and are arranged in about 15 genera, several of which are confined to tropical America. North America has six genera and 14 species. Closely related to the wrens are the mocking thrushes, which some ornithologists place in the same family, and the creepers (*Certhiidae*). The wrens are plain little birds usually clothed in modest browns and seldom exhibiting bright colors or very conspicuous markings. They are insectivorous and mostly migratory, though particular species may inhabit either warm or cold regions. Their haunts are mostly brush piles, tangled roots, stone walls and similar places, where they pry into every nook and cranny; they enter holes and reappear in another place in very mouse-like fashion; and are altogether very sprightly little creatures. Their songs are wonderfully loud and vehement for such small birds, but differ characteristically for each species. Although the nests vary greatly in their location, which is most often a hole of some sort, they are always more or less spherical in construction. Few passerine birds are more prolific, the eggs numbering from 5 to 10, and many of the species producing several broods.

Few birds are more familiar in the United States than the house-wren (*Troglodytes aedon*). It is about five inches long. The color is very uniform, reddish brown above, barred with dusky, and pale fulvous white below. It often builds its nest near houses, and in boxes prepared for it or in any convenient hole. The nests are made to fill the boxes; and to effect this a large mass of heterogeneous materials is sometimes collected. From six to eight eggs constitute a brood and two or three broods are produced in a summer. The eggs are so thickly spotted with brown that they appear to be almost uniformly colored. The song is extremely rapid and vivacious as though the performer were overflowing with good spirits. The male is a very bold, pugnacious bird, readily attacking birds far larger than itself, as the bluebird and swallows, and taking possession of the boxes

WRESTLING—WRIGHT

which they have appropriated for their nests. It even attacks cats when they approach its nests and vigorously scolds all intruders.

The winter wren (*T. hyemalis*) is our smallest species of wren, only about four inches long, and the ridiculous little tail is usually cocked straight up into the air. Above, the color is a rich dark brown; below it is much lighter, both regions prettily barred. The typical form inhabits most of eastern North America, the Canadas, and northernmost United States during the summer and the rest during the winter. Except in the higher mountains, it is known in the New England and Middle States only in the latter season. It is a silent, secretive bird of the winter brush-heap and roadside, but withal bold and saucy and prone to state its opinion of intruders. The summer song is said to be powerful and musical, and the nest to be placed in a hole in a log or root near the ground. The eggs are white, spotted with reddish brown.

Of the genus *Cistothorus*, or marsh-wrens, we have three species, of which one (*C. marianæ*) is a Florida form. See MARSII-WREN.

Thryothorus comprises the mocking wrens, of which *T. ludovicianus*, the great Carolina wren, is the best known Eastern species, and the largest of the wrens of this region. It is six inches long, of which the tail is $2\frac{1}{4}$ inches, about equaling the wings. It is nearly uniform bright reddish brown above with yellowish white under parts, a conspicuous white superciliary streak, and the wings and tail cross-banded with black. It lives east of the plains, but is more abundant South and scarcely gets northward beyond Pennsylvania, in which region, however, it is becoming more plentiful of late years. It inhabits deserted buildings, old mills, and shrubbery in secluded spots and builds its nest in crannies in such places, laying six or more white eggs speckled with various shades of brown. The loud clear whistled song is very characteristic and as this bird is scarcely migratory is heard in winter as well as summer in the neighborhood of Philadelphia. This bird also mimics the notes of others. Bewick's wren (*T. bewickii*) is a related species very abundant in the interior southward, while a number of other species and subspecies of the same genus are found in the West and Southwest. In the latter region also, as well as in Mexico and southward, occur several large wrens which have broad spreading tails composed of somewhat cuneate feathers. Among these are the cactus wrens (q.v.), which build purse-shaped nests in bushes in the desert regions of Texas, California, etc., and the rock-wrens and cañon-wrens (qq.v.) which live and nest in rocky places. They have loud ringing songs. In Europe are several species of *Troglodytes*, of which the beloved common or jenny wren (*T. parvulus*) is found in all parts of Europe, and in Morocco and Algeria, and in Asia Minor and northern Persia. In central Asia it is represented by *T. pallidus*, in Iceland and the Faroes by *T. borealis*, and in Norway by *T. bergensis*. In England the vernacular name wren is also applied to various species of warblers, and elsewhere to other small birds.

Consult: Baird, Brewer, and Ridgway, 'Land Birds of North America' (Boston 1874); Sharpe, 'Catalogue Bird of the British Museum,' Vol. VI. (London 1881).

Wrestling, the most ancient form of athletic exercise, and at one time the favorite pastime of the Greeks. The Olympic Games (q.v.), the great festival of the Greeks, which were instituted for the exhibition of various trials of strength and skill, included races on foot, and with horses and chariots, contests in leaping, throwing, boxing, and wrestling. One of the great objects of the old classical wrestlers was to make every attack with elegance and grace under certain laws of a most intricate nature, and the game is described by Plutarch as the hardest working form of athletics. In Devon and Cornwall, England, wrestling on the catch-hold principle still finds favor. In Lancashire they adopt a catch-as-catch-can style; while in Cumberland and Westmoreland the ancient back-hold system continues to hold its own. In the United States and Australia, in Germany, France, and Japan, ground wrestling, which is the most objectionable of all known methods, is the most popular. This system has been dignified by the title of Græco-Roman wrestling. The Græco-Roman style is practically the same as the French method, and consists of a struggle on the ground till one or other of the competitors is compelled through sheer exhaustion to give in; indeed, such a contest is simply an exhibition of brute strength. On commencing, the wrestlers take hold from the head and not lower than the waist, when both roll on the ground, and then the actual struggle begins. Tripping, which is the very essence of the game, is not allowed; therefore weight and strength are the only factors in the contest, which terminates when one of the combatants has been placed on both shoulders. Wrestling has recently become popular in Japan and India. The Japanese have adopted the Græco-Roman style, and receive handsome rewards at the conclusion of their contests. The Jap wrestlers, who are a most formidable class of men, before entering the arena adorn themselves with a certain kind of paint, with a huge belt round the waist and their enormous calves encased in stout leggings. The Indians, on the other hand, wrestle in bathing costume, and in a match only contest one bout, and one shoulder on the ground is deemed a fall.

Wrexham, rēks'am, North Wales, a market-town in the county of Denbigh, 12 miles south of Chester, in a district containing coal, lead, and iron. It is a station on the Great Western and Great Central railways, and has several churches and other places of worship, schools, guildhall, infirmary, barracks, market-halls, public baths, electricity-works, free library, etc. The restored parish church, dedicated to St. Giles, was erected in the reign of Henry VII., and is an exquisite specimen of florid Gothic. There are in the town large breweries, tanneries, etc. Pop. (1901) 14,966.

Wright, rit, Albert Allen, American geologist: b. Oberlin, Ohio, 27 April 1846. He was graduated from Oberlin College in 1865, in 1872 and 1882 was attached to the Ohio Geological Survey, and has been professor of geology and zoology at Oberlin from 1874.

Wright, Arthur Williams, American physicist: b. Lebanon, Conn., 8 Sept. 1836. He was graduated from Yale in 1859, studied law and was admitted to the bar, but did not practise, and was a tutor in Latin at Yale 1863-6, and

WRIGHT

in physics 1866-8. He afterward studied at Heidelberg and Berlin, was professor of physics and chemistry at Williams College 1869-72; of molecular physics and chemistry at Yale 1875-87 and of experimental physics there since 1887. From 1885 he has been in charge of the Sloane physical laboratory at Yale. He has published numerous professional papers, is a fellow of the Royal Astronomical Society of Great Britain and a member of various other learned societies.

Wright, Carroll Davidson, American economist, statistician, and sociologist: b. Dunbarton, N. H., 28 July 1840. After a secondary education and some study of law, he enlisted in the 14th New Hampshire volunteers at the outbreak of the Civil War, and in 1864 became its colonel. In 1865 he was admitted to the bar at Keene, N. H., in 1867 began practice at Boston, in 1872-3 was a member of the Massachusetts senate, and in 1873-88 chief of the Massachusetts bureau of labor statistics. He was appointed national commissioner of labor in 1885, and he continued in this office for some time after his election as president of the collegiate department of Clark University (Worcester, Mass.) in 1902. In 1895 he became honorary professor of social economics in the Columbian University (Washington, D. C.), and he has delivered lectures in numerous institutions. He was chosen president of the American Statistical Association, in 1902 chairman of the section on social and economic science in the American Association for the Advancement of Science and vice-president of the association, and in 1903 president. He was recorder of the commission appointed by the President to arbitrate in connection with the anthracite coal strike in the fall of 1902. In the many reports and bulletins published by him he has made important authoritative contributions on sociological and economic topics. Besides these and numerous contributions to periodicals, he has written 'The Industrial Evolution of the United States' (1895); and 'Outlines of Practical Sociology' (1899).

Wright, Charles Henry Hamilton, Irish Anglican clergyman: b. Dublin 9 March 1836. He was graduated from Trinity College, Dublin, in 1857, was Bampton lecturer at Oxford in 1878, Donnellan lecturer at Dublin 1880, Grinfield lecturer on the Septuagint at Oxford 1893-7, and vicar of St. John's, Liverpool, 1891-8. Among his numerous publications are: 'Fragments and Specimens of Early Latin' (1874); 'The One Religion' (1881); 'Biblical Essays' (1885); 'Roman Catholicism in the Light of Scripture,' 2d ed. (1897); 'The Intermediate State and Prayers for the Dead' (1900); 'Genuine Writings of Saint Patrick with Life' (1902).

Wright, Fanny. See D'ARUSMONT, FRANCES.

Wright, Elizur, American abolitionist expert: b. South Canaan, Conn., 12 Feb. 1804; d. Medford, Mass., 21 Nov. 1885. He was graduated at Yale in 1886, was professor of mathematics in Western Reserve College in 1829-33, and became identified with the anti-slavery movement in the last named year. He then removed to New York, where he edited 'Human Rights' (1834-5) and the 'Quarterly Anti-Slavery Magazine' (1837-8), and was at the same time secretary of the Anti-Slavery Society. Removing to Boston in 1838 he there

edited the 'Massachusetts Abolitionist,' the *Daily Chronotype* (1845), and *The Commonwealth*, its successor (1850). He published 'Savings Banks Life Insurance' (1872); 'The Politics and Mysteries of Life Insurance' (1873), etc.; and was (1858-66) insurance commissioner of Massachusetts. He wrote an introduction to Whittier's poems (1844); and published a translation in verse of 'La Fontaine's Fables' (1859).

Wright, George Frederick, American educator and geologist: b. Whitelaw, N. Y., 22 Jan. 1838. He was educated at Oberlin College and Theological Seminary, and held Congregational pastorates at Bakersville, Vt., 1862-72, and Andover, Mass., 1872-81. He was professor of New Testament literature in Oberlin College 1881-92, and of the harmony of science and revelation since the last named year. He was connected with the United States Geological Survey 1884-92. His works include: 'The Logic of Christian Evidence' (1880); 'Studies in Science and Religion' (1882); 'The Relation of Death to Probation' (1882); 'The Glacial Boundary in Ohio, Indiana, and Kentucky' (1884); 'The Divine Authority of the Bible' (1884); 'The Ice Age in North America'; 'Man and the Glacial Period'; 'Aspects of Christian Evidences' (1898); 'Asiatic Russia' (1902), etc. He has edited the 'Bibliotheca Sacra' since 1884.

Wright, Horatio Gouverneur, American military officer: b. Clinton, Conn., 6 March 1820; d. Washington, D. C., 2 July 1899. He was graduated at West Point in 1841, was superintending engineer of the building of Fort Jackson at Tortugas, Fla. (1846-56); lighthouse engineer in Florida (1852-3); and assistant to the chief of engineers in Washington (1856-61). He was active throughout the Civil War, became brigadier-general of volunteers in September 1861, and took command of the Department of Ohio in August 1862. He commanded a division at the battle of the Wilderness, a corps at Spottsylvania Court House and Cold Harbor, 3 June; served as major-general at the battle of Opequan Creek, 19 Sept. 1864, and contributed to the decisive victory at Cedar Creek, 19 Oct. 1864. He was brevetted major-general in the United States army for his services at the capture of Petersburg, 13 March 1865, and was mustered out of the volunteer service 1 Sept. 1866. He then returned to regular army duty as lieutenant-colonel of engineers, becoming brigadier-general and chief of engineers 30 June 1879, retiring 6 March 1884.

Wright, John Henry, American classical scholar: b. Urumyah, Persia, 4 Feb. 1852. He was graduated from Dartmouth in 1873, and studied at Leipzig 1876-8. He was associate professor of Greek at Dartmouth 1878-86, professor of classical philology at Johns Hopkins 1886-7, and since 1887 professor of Greek at Harvard and dean of the graduate school from 1895. He has been editor-in-chief of the 'American Journal of Archaeology' from 1897, and has edited several important works.

Wright, John Vines, American jurist: b. Purdy, Tenn., 23 June 1828. He was admitted to the bar in 1852 and was a member of Congress in 1855-61. During the Civil War he served in the Confederate army, first as captain and later as colonel of the 13th Tennessee regi-

WRIGHT

ment; until elected to the Confederate Congress, in which body he remained till the fall of the Confederacy in 1865. He then became a judge of the circuit court and afterward chancellor and judge of the Tennessee supreme court. In 1886-90 he was chairman of the Northwest Indian Commission and concluded many treaties with Indians. He was defeated for governor of Tennessee in 1880.

Wright, Joseph, American artist: b. Bordentown, N. J., 16 July 1756; d. New York 1793. He obtained his art education in England and Paris, in 1783 returned to America, and in that year painted a portrait of Washington. Subsequently he executed another for the Comte de Solms, and still later a miniature profile. Among his other portraits were those of Jay and Madison. In 1792 he was made first draughtsman and die-sinker in the mint newly established at Philadelphia. He was the designer of the first coins and medals struck by the national government.

Wright, Joseph, English philologist: b. 31 Oct. 1855. From 1891 to 1901 he was deputy-professor of comparative philology in the University of Oxford, and in 1901 was made professor. Among his publications are a rendering of Brugmann's 'Grundriss der vergleichenden Grammatik der Indogermanschen Sprachen,' Vol. I.; text-books of Middle and Old High German, and a grammar of the dialect of Windhill in the West Riding of Yorkshire. But he is known for his 'English Dialect Dictionary,' begun in 1896, and announced to be completed in 1905. This is of much value to the special student.

Wright, Julia McNair, American author: b. Oswego, N. Y., 1 May 1840; d. Philadelphia, Pa., 2 Sept. 1903. She was married in 1859 to Rev. W. J. Wright and published numerous temperance and anti-Roman Catholic stories, among which were 'Almost a Nun'; 'Priest and Nun'; 'The Gospel in the Riviera'; 'The Heir of Athole.'

Wright, Luke E., American lawyer and administrator: b. Memphis, Tenn., 1847. He studied law, was admitted to the bar, and began the practice of his profession at Memphis, where he soon attained a leading rank among the lawyers of the city. In 1878 he was one of the most active in the relief work during the yellow fever scourge; and in 1880-8 was attorney-general of the State. In politics he has been affiliated with the Democratic party, but in 1896 supported the Gold Democrats. In 1900 he was appointed a member of the Philippine Commission; and on the organization of civil government in the Philippines was placed at the head of the department of commerce and police, and shortly afterward was appointed to the newly created office of vice-governor. He was thus acting governor during Governor Taft's absence in 1902; and in 1903, when Taft was appointed secretary of war, his thorough acquaintance with the condition of the islands, and his marked executive ability, led to his appointment as governor-general of the Philippines.

Wright, Mabel Osgood, American writer on nature, daughter of Samuel Osgood (1812-80) (q.v.): b. New York 1859. She was married in 1884 to J. O. Wright and has made her

home in Fairfield, Conn. She has edited 'Bird Lore,' with F. M. Chapman, and has published 'The Friendship of Nature,' a series of outdoor studies (1894); 'Birdcraft,' a book on New England birds (1895); 'Tommy-Anne: A Natural History Story' (1896); 'Citizen Bird,' a book for beginners (1897); 'The Dream Fox Story Book' (1900); 'The Flowers and Ferns in Their Haunts' (1901); 'Dogtown' (1902); etc.

Wright, Marcus Joseph, American soldier, brother of J. V. Wright (q.v.): b. Purdy, Tenn., 5 June 1831. He studied law, was admitted to the bar and practised his profession in Memphis till the outbreak of the Civil War, when he entered the Confederate army as lieutenant-colonel of a Tennessee regiment. He was promoted brigadier-general in 1862 and was wounded at Shiloh. He has written 'Life of Gen. Winfield Scott' in 'Great Commander' series (1894); 'Life of Governor William Blount'; etc. Since 1878 he has been agent of the War Department for collections of military records.

Wright, Mary Tappan, American novelist: b. Steubenville, Ohio, December 1851. She was a daughter of Eli Tappan, a president of Kenyon College, and in 1879 was married to John Henry Wright (q.v.). Her work in fiction, which displays much keen characterization and charm of style, includes: 'A Truce and Other Stories' (1895); 'Aliens' (1902); 'The Test' (1904).

Wright, Silas, American statesman: b. Amherst, Mass., 24 May 1795; d. Canton, N. Y., 27 Aug. 1847. He was graduated at Middlebury College, Vt., in 1815, studied law, was admitted to the bar in 1819, and established himself as an attorney at Canton. In 1823 he entered the State senate, where he steadily opposed the political advancement of De Witt Clinton, which he regarded as dangerous to the Democratic party, of which throughout his life he was a firm adherent. He sat in Congress 1827-9, and there advocated and voted for the protective tariff of 1828. He also voted for the appointment of a committee to inquire into the expediency of abolishing slavery and the slave trade in the District of Columbia. He was comptroller of New York 1829-33, and a United States senator 1833-44. He supported Clay's compromise bill in 1833; voted against receiving a petition for abolishing slavery in the District of Columbia, and in favor of excluding from the mails all "printed matter calculated to excite the prejudices of the Southern States in regard to the question of slavery"; voted for the tariff of 1842, though most of his political associates in the senate voted against it; and voted for the annexation of Texas to the Union. In 1844, against his will, he was nominated by his party to be governor of New York, and was elected. President Polk offered him the office of secretary of the treasury in 1845, but he declined it, as he had previously declined a seat on the supreme bench. As governor he vetoed a bill appropriating money for works on the canals, on the ground that the effect of the bill was to resume the enlargement of the canals, which had been suspended by law in 1842, out of regard for the financial safety of the State; recommended legislation against the anti-renters, and on occasion of disturbances produced by them in Delaware County in 1845

WRIGHT — WRIGHTSVILLE

proclaimed the county to be in a state of insurrection and called out a military force. Nominated for re-election in 1846, he was defeated by the Whig candidate. When the application of the Wilmot proviso to the territories obtained from Mexico was under discussion, Wright emphatically declared that the arms and the money of the Union ought never to be used to acquire territory then free for the purpose of planting slavery upon it. On the expiration of his term as governor he returned to his farm at Canton. Consult 'Lives' by Jenkins (1847); Hammond (1848); Gillet (1874).

Wright, Thomas, English antiquary: b. Tenbury, Shropshire, 23 April 1810; d. Chelsea, London, 23 Dec. 1877. He was graduated at Trinity College, Cambridge, settled in London, and devoted himself to the study of English history, literature, and antiquities. He was one of the founders of the Camden Society, and of the British Archaeological Association, whose journal he edited 1843-50. Of the Percy Society and the Shakespeare Society he was also an active member, and in 1842 he was chosen a corresponding member of the French Academy of Inscriptions. He edited a great number of rare works connected with Early English literature and history which have been published in England by the societies above mentioned, and also published 'Queen Elizabeth and Her Times' (1838); 'Essays on the Literature, Popular Superstitions, and History of England in the Middle Ages' (1846); 'Narrative of Sorcery and Magic' (1851); 'The Celt, the Roman, and the Saxon' (1852, 5th ed. 1890); 'Wanderings of an Antiquary' (1854); 'The History of Ireland' (1857); 'Dictionary of Obsolete and Provincial English' (1858); 'History of France' (1858-60); 'Essays on Archaeological Subjects' (1861); 'Manners and Sentiments in English During the Middle Ages' (1862); 'History of Caricature and the Grotesque' (1865); 'Womankind in Western Europe' (1869).

Wright, Thomas, English biographer: b. Olney, Buckinghamshire, 16 May 1859. He was educated at Baxton College, Forest Gate, and is now (1904) principal of the Cowper School at Olney. He is the founder of the Cowper Society and has published 'The Town of Cowper' (1886); the novels 'The Chalice of Carden' (1889); 'The Blue Firedrake' (1892); and 'The Mystery of St. Dunstan's' (1892); 'Life of William Cowper,' the standard biography of the poet (1892); 'Life of Daniel Defoe' (1894); 'The Correspondence of William Cowper' (1902); 'Go, or How to Succeed in Life' (1902); etc.

Wright, William Aldis, English scholar: b. 1836. He was a contributor to Smith's 'Dictionary of the Bible' (1860-3), secretary to the Old Testament Revision Company in 1870-85, and from 1868, the year of its establishment, editor of the 'Journal of Philology.' In 1888 he became vice-master of Trinity College, Cambridge. With W. G. Clark (q.v.), he collaborated on the 'Cambridge Shakespeare' (1863-6) and the 'Globe' edition of Shakespeare's complete works (1864). Among his other publications are editions of: the 'Letters and Literary Remains of Edward Fitz-Gerald' (1889); of the 'Facsimile MSS. of Milton's Minor Poems' (1899); 'Fitz-Gerald's Miscellanies' (1900); 'More Letters of Edward Fitz-Gerald' (1901);

'Literary Remains of Edward Fitz-Gerald' (1902-3); and 'Milton's Poetical Works' (1903).

Wright, William Burnet, American Presbyterian, clergyman: b. Cincinnati, Ohio, 15 April 1838. He was graduated from Dartmouth in 1857, was four years pastor of the South Congregational Church, Chicago; 20 years pastor of the Berkeley Street Church, Boston, and three of the First Congregational Church, New Britain, Conn., and subsequently of the Lafayette Avenue Presbyterian Church, Buffalo, prior to 1901. He has published 'Ancient Cities from the Dawn to the Daylight' (1887); 'The World to Come' (1887); 'Master and Men' or 'The Sermon on the Mountain Practised on the Plain' (1894).

Wrightia, an apocynaceous genus of small trees and shrubs, with long loose branches, named after William Wright (1740-1827), a Scotch botanist resident in Jamaica. The flowers are salver-shaped, white, yellow, or red, usually in terminal cymes, and have a short corolla-tube, five or more scales at the throat, and an exerted cone of sagittate anthers. *W. tinctoria* is a small tree, a native of Burma and Southern India. The wood resembles ivory in its hard, close grain, and exquisite whiteness, and like that other species of the genus, is used for small articles of turnery. The tree is also known as ivory-tree, Pala, and palay. The seeds are said to be used in dyeing, and the leaves, with the seeds of *Cassia tora*, yield, a blue dye known as pala-indigo, but inferior to the genuine indigo. *W. tomentosa*, a small, deciduous tree, growing in India and Burma, has a yellow juice, which, mixed with water, produces a permanent yellow dye. It is used by the Nepalese to stop bleeding, and the bark is given as an antidote to snakebite. *W. antidysenterica*, a small tree found in India and Burma, is a most valuable remedy for dysentery; the Arabs and Persians consider the seeds as carminative, astringent, tonic, and aphrodisiac. This tree is now classified under *Holarrhena*, and is a principal source of conessi- or pala-bark.

Wrightsville, York County, Pa., on the Susquehanna River, 31 miles southeast of Harrisburg and 11 miles northeast of York, was the farthest point east reached by the Confederates during the Civil War. In the campaign preceding Gettysburg Gen. Early was ordered to seize the bridge across the Susquehanna at this point, a wooden structure over a mile long, resting on stone piers. Included in the structure was a railroad bridge, a pass-way for wagons, and also a tow-path for the canal which here crossed the Susquehanna. On 28 June 1863 the bridge was defended by the 27th Pennsylvania militia, a few companies of the 20th and some other organizations and convalescents hastily collected, in all numbering about 1,200 men, under command of Col. J. G. Frick, 27th militia. Frick held an intrenched line about a half mile west of Wrightsville. Gen. Gordon's brigade, with Capt. W. A. Tanner's battery and White's battalion of cavalry, marching through York, appeared before Frick's position on the evening of 28 June and began skirmishing, under cover of which Gordon endeavored to cut him off from the bridge by a flank movement, but failed, and then opened fire with Tanner's artillery, to which Frick

WRIT — WRITING

could not reply, being without guns. His rear threatened, Frick retreated across the bridge and fired it, leaving 18 or 20 prisoners in Gordon's hands. Gordon attempted to follow, but was checked by the flames. The bridge was totally destroyed and the flames communicated to the town of Wrightsville, consuming several buildings, but the further progress was arrested by Gordon's men. The destruction of the bridge was a keen disappointment to Early, who had hoped to cross it and attack Harrisburg from the east side of the river. On the 29th Gordon marched back to York.

E. A. CARMAN.

Writ. In general understanding a writ is a mandatory precept issued by the authority of and in the name of the executive branch of the State for the purpose of compelling the defendant to do some particular thing mentioned in the instrument. Writs are generally classified as mandamus, habeas corpus, summons, error, quo warranto, certiorari, or review. Writs are further distinguished as original and judicial. Original issued without any order of the court in the particular case, judicial issued in pursuance of a decree or order or judgment of the court. A writ of mandamus is a command issuing from a court of law of competent jurisdiction, in the name of the State, directed to some inferior court, officer, corporation, or person, requiring them to do some particular thing therein specified, and which appertains to their office or duty. In order to secure a writ of mandamus it is necessary to show (1) that the petitioner has a legal right to have the thing done which it is sought to be done; (2) that it is the duty of the respondent to perform it; (3) that the writ is the only plain, speedy, and adequate remedy. A writ has a purely personal effect. An injunction—either mandatory or prohibitory—is a writ framed according to the circumstances of the case commanding an act which the court regards as essential to justice, or restraining an act which it esteems contrary to equity and good conscience. Quo warranto is an order to show by what authority a given act is done or office held. A writ of error is a commission to a superior court by which they are authorized to examine the record in a case on which judgment has been given in an inferior court. Habeas corpus is an order issued by a magistrate to an officer in charge of the person of the defendant and designed to give summary relief against illegal restraint of personal liberty. Summons is a demand made to a person to appear at a given time before a court or officer. Certiorari or review is an order to a superior court to review the evidence presented before an inferior court.

Writers' Cramp, or Scriveners' Cramp or Palsy, an occupation-neurosis to which those who do much writing, especially with the hand too tightly contracted, are very liable. A person with this trouble has no complete control over the muscles of the thumb and middle and fore fingers, brought into use in writing, although other manual operations are performed without difficulty. The affection seldom manifests itself till toward middle age. The various methods of treatment that have been proposed have not been very successful. Small surgical operations have been performed with occasional but far from general good results. The application of electricity to the adductor of the thumb,

and the kneading of the muscles of the ball of the thumb and the lower part of the forearm, so as to promote the circulation in those parts, are said to be beneficial, but the only way to obtain perfect relief is for the patient to abstain from writing altogether. If he is obliged to write he will do so with more ease if he uses a pen with a very thick handle. For extreme cases several contrivances have been devised for assisting the patient to write by altering the movements of the fingers in writing, and giving support to the ball of the hand. The typewriter has proved the best resource of those who suffer from the ailment. See NEUROSIS; OCCUPATION, HYGIENE OF.

Writers to the Signet, in Scotland, where lawyers generally are called writers, an incorporated legal society dating from an early period of Scottish history. Originally, the name probably applied to clerks in the office of the secretary of state, where was deposited the seal by which the king's letters and writs for the purposes of justice were authenticated. This duty was monopolized by this close society of practitioners, members being appointed not by public officials, but by the organization. Thus the Writers to the Signet came to control admissions to the bar, like the English Inns of Court (q.v.). They still retain a certain prestige at the bar, but not their former monopoly.

Writing, the art of recording ideas by means of characters or figures of some sort impressed upon some kind of material substance. History, though it does not throw complete light on the origin of writing, suffices to show certain stages in its progress, and upon these a classification has been founded, which is, however, incomplete and unsatisfactory. The simplest classification, and perhaps at an initiatory stage the best, is that which divides all writing into ideographic and phonographic, or signs representing the things symbolized by words, and signs representing sounds, that is, words themselves. Less satisfactory is the classification of writing into three historical stages, the figurative, the transitional or conventional, and the alphabetic. In the first of these, to which hieroglyphic writing belongs, writing is supposed to be pictorial, or immediately representative of objects. After this, in the transitional period comes symbolical writing, in which abbreviated pictures are transformed into arbitrary symbols, first of things, and afterward of sounds and words. Lastly, with the prevalence of phonetic writing sounds are represented first in syllables, and afterward in letters. The course of writing is generally in the direction thus indicated, but it is inaccurate and misleading to represent these stages as epochs in its progress. As the most modern writing contains traces of the first of these methods, so the earliest contains traces of the last. The majority of the letters in modern alphabets can be traced to symbols, or abbreviated pictures representative of things, but as the thing originally represented is usually an object whose name begins with the sound represented by the letter, there is no evidence that the sign was not originally intended in a double sense and used as a phonograph. In Egyptian hieroglyphics we have ideographs and phonographs mixed together. This, however, does not prove the absolute precedence of ideographs, but only the imperfection of the phono-

WRITING

graphic elements in that system. The same thing occurs in the Mexican picture writing, which was long supposed to be purely ideographic. Its phonetic signs are syllabic, not alphabetic. In our own system we use figures and other symbols when phonographic signs are too slow for our purpose, and with a less perfect phonographic system this would naturally occur much more frequently. It does not appear, moreover, that any transition from pictorial to phonetic writing is necessary through arbitrary non-phonetical symbols. Both of these modifications would no doubt proceed simultaneously from independent causes. Pictorial signs not phonetized would be abbreviated as well as phonetized signs, and when the phonetized abbreviations came to prevail the non-phonetized abbreviations would be phonetized also, thus producing the appearance of a transition from arbitrary symbols to phonetic signs.

The reason why writing has had to pass through various stages of pictorial and more or less arbitrary symbolical representation before reaching the more perfect development of the alphabetic form is not very difficult to discover, and it has an important bearing on the order of development. It is not because the representation of words is in itself more difficult to conceive of than the representation of things, or because when the desire for writing as a medium of communication is excited the human intellect is inadequate to the task of forming at once an entire phonetic system. Had phonetic or even alphabetic representation been the only possible means of constructing a written symbol all difficulties would doubtless have been overcome by one sustained effort, as they have actually been by many partial ones; but as an easier process was to be found, and would directly suggest itself as a means of meeting the immediate demand, the more elaborate process was excluded and prevented by this process from being performed. Nothing is easier than to make a rude pictorial representation of certain objects. To draw something resembling a man would be easier than to agree on a sign to represent the word man, hence ideographs would naturally precede phonetic symbols. But for the same reason the earliest systems of writing would not be purely ideographic but mixed. There are many things which form the subject of the least sophisticated human communications which cannot be represented pictorially. When writing was first practised these things were already represented by words, and the idea would naturally occur to form a sign to represent the word, that is, a phonetic sign. These signs could not be directly pictorial, but they might be allegorical or symbolic, and in the absence of analysis of sound they probably would take that form, although the direct intention was to suggest conventionally a specific word by the symbol. This sort of symbol might be called a mnemonic. From such symbols to merely arbitrary syllabic and alphabetic symbols the transition would be easy.

It is generally agreed that writing was introduced to the western nations by the Phœnicians, and it is commonly believed that the Phœnician system was based on the Egyptian, but the comparative antiquity of the Egyptian and Assyrian or Akkadian, the hieroglyphic and cuneiform systems, cannot be definitely determined. The Egyptians attributed their writing

to Thoth, and the first characters are said to have consisted of portraits of the gods. The cuneiform writing, which is cumbersome and exceedingly difficult to read, has been adapted to several languages, the Akkadian, the Assyrian, the Persian, etc., in a variety of ways, ideographic, syllabic, and alphabetic. The Egyptians had three distinct kinds of writing, the hieroglyphic, the hieratic, and the enchorial or demotic. The first is a mixed system, containing large numbers of signs of various characters, ideographic and phonetic. It is used chiefly for inscriptions on monuments and public buildings. The hieratic is a cursive hand abridged from the hieroglyphic for use on papyri. Both these forms were sacred, and the priestly caste only were initiated in them. The demotic was introduced much later than the other forms. It was used for trading and common purposes, and in civil documents. The hieratic writing was more phonetic than the hieroglyphic, and the alphabetic character prevailed in the demotic. The first was written in any direction according to the form of the surface; the hieratic was at first written in columns, but afterward always in horizontal lines. The hieratic and demotic are read from right to left, but the individual letters are formed from left to right. The connection between the Egyptian and the Semitic writings, to which the Phœnician belongs, is by no means unanimously admitted, many scholars holding that the resemblances between them may be explained by the independent adoption of common principles. The leading Semitic forms are the Samaritan or ancient Hebrew, the Chaldee or East Aramaic, the Syriac or West Aramaic, and the Kufic or early Arabic, which continued to be used in MS. for several centuries after the Mohammedan conquest, after which it was replaced by the Neshki or modern Arabic, which, with some slight modifications, is the same with the modern Persian. The Hebrew alphabet now in use, the Babylonian or East Aramaic, is entirely consonantal, the vowel points being of modern origin. The Phœnician which formed the basis of the western languages was of a similar character. Phœnician writing was anciently represented to have been brought by a Cadmean colony to Bœotia about the 16th century B.C. (see CADMUS); and a certain number of the Greek letters are undoubtedly of Phœnician origin. (See the section on language and writing in the article GREECE.) The Greeks at first wrote from right to left, and afterward adopted the method called *boustrophædon*, from the motion of the ox in plowing, that is, alternately from right to left, and from left to right. Writing from left to right was said to have been introduced in the time of Homer by Pronapides of Athens. The various modifications which the Phœnician or Pelasgian forms underwent in Italy are to be found by comparison of the Oscan, Etruscan, Umbrian, and early Latin inscriptions. In the ancient Greek and Roman writing, and even for a time in the mediæval writing of Europe, the words were not separated by spaces, and no punctuation marks were used. The present cursive characters with modifications occur in Greek inscriptions of the age of Augustus. In mediæval manuscripts a variety of styles were adopted in different epochs and countries, and for different uses, to describe which in detail would require a separate treatise. In France the various styles were called after

the dynasties under which they prevailed: Merovingian, Carolingian, Capetian, Valesian, and Bourbon. There were also a variety of styles used for different purposes distinguished by such names as *majuscule* and *minuscule* (great and small letters), diplomatic minuscule, and many others. Capitals were not then used as now to distinguish prominent words, but whole manuscripts were written in large or small capitals. There were also a variety of mixed styles. From the 8th to the 11th centuries writing with *tremblements* was affected in France. The diplomatic minuscule was a mixture of minuscule and cursive characters distinguished by an unusual prolongation of the long letters. Uncial letters, which prevailed from the 7th to the 10th centuries, were rounded capitals with few hair-strokes. The practice of ornamenting pages began in the 8th century, and the earliest manuscripts are also without title-pages. The so-called Gothic characters, in reality of scholastic origin, are merely fanciful deviations from the Roman types, such as the rounding of straight limbs, the substitution of angular facets for rounded forms, with hair-lined projections from the extremities contrasting with massive body-strokes. They became common in inscriptions from the 13th to the 15th centuries, and were employed in church-books from the time of St. Louis. The Gothic cursive was introduced about the middle of the 13th century. The modern German alphabet was also introduced in the 13th century. In England a variety of styles called Saxon prevailed in the early Middle Ages. An elegant mixed style was formed of a combination of Roman Lombardic and Saxon characters. The Norman style of writing came in with William the Conqueror. The old English form of Gothic dates from the middle of the 14th century. The English "court hand," an adaptation of Saxon, prevailed from the 16th century to the reign of George II. In regard to the antiquity of writing in other parts of Europe, it was known to the Gauls before the time of Cæsar; but no traces of the ancient writing remain, and whether it was derived from the Greeks or the Phœnicians is doubtful. There are slight traces of writing in Britain previous to the Roman period, but if it were employed by the Druids, as Cæsar says, it may have existed without leaving remains. The Germans claim the knowledge of writing previous to their contact with the Romans; but in their case also we are without early remains. The Runic alphabet used for many centuries in Denmark, Norway, etc., may have been employed long before the Christian era.

In the East we find one of the most striking contrasts in the history of language. The Chinese, who have an ancient system of writing which they attribute to Fou-hi, have never reached the alphabetic system. Their characters are syllabic, and as Chinese words are monosyllables, they are strictly ideographic. They have been adopted in this way by peoples speaking not only different dialects, but different languages, who apply the signs to words of different sound but of the same signification as the original. The Chinese system is said to contain 40,000 characters. They were originally hieroglyphic, but from difficulty of interpretation have become conventional. There are, of course, certain general principles of combination and construction, but to master the whole system is said

to be the work of a lifetime. Only a limited portion of it can therefore have any real existence as a medium of communication. Sanskrit, on the other hand, possesses the most perfect known alphabet. The Hindus claim to have derived it from the gods, and call one form of it *devanāgarī* (divine city). It is wholly different from the Semitic, and is founded on a much more complete and subtle analysis of sound. Its consonant signs number 33, its vowel signs 14. They are applied with an analytical method which gives a power of distinction vastly superior to that of European alphabets, and which is greatly admired by scholars. Sanskrit is written from left to right. By means of its derivatives it is widely diffused in the East. The Pali, which forms the sacred language of the Buddhists, has carried it far beyond India. The Burmese Pali character is square, the Siamese round. To complete the vagaries which have prevailed in the direction of writing, the Mexican picture writing was written from bottom to top. See ALPHABET; CUNEIFORM WRITING; ETYMOLOGY; HIEROGLYPHICS; LANGUAGE; PHILOLOGY; SCIENCE OF LANGUAGE; SPEECH.

Wroeites, rō'its, a sect named from John Wroe, who died in Australia 6 Feb. 1863, and who claimed to have received Divine revelations. They are few in numbers, and sometimes called Christian Israelites. They teach the immediate second coming of Christ.

Wrong, George McKinnon, Canadian educator: b. Ontario 25 June 1860. He was educated at University and Wycliffe colleges in Toronto, took orders in the Church of England and in 1894 succeeded Sir Daniel Wilson as professor of history in the University of Toronto. He is co-editor with H. H. Langton of the annual 'Review of Historical Publications Relating to Canada.'

Wrybill, an extraordinary plover (*Anarhynchus frontalis*) of New Zealand, which is unique in having a bill bent sideways near the tip,—always toward the right. By this peculiarly adapted instrument it seems to be able to reach and obtain many small crustaceans, etc., which are able to creep under stones out of reach of all the other shore-birds of the region, which have only the ordinary straight kind of beak. The questions and inferences which arise in the mind of the evolutionist in view of this case will be found treated in Newton's 'Dictionary of Birds,' with references to other authorities. See PLOVER.

Wryneck, a European bird (*Iynx* or *Yunx torquilla*), related to the woodpeckers, which has a habit of twisting its head in a curious manner. This bird visits Great Britain in summer, arriving in April, usually with or just before the cuckoo, and hence is named the "cuckoo's mate." The food consists of insects, and chiefly of ants and their pupæ. It is also said to eat elderberries. The tongue is long and extensible, like that of the woodpeckers. The nest is formed in the holes of trees; and the eggs vary from six to ten.

Wryneck. See TORTICOLLIS.

Wu-chang, woo'chāng', or **Woo-chang**, China, a city of the province of Hu-peh, on the Yang-tse-kiang, opposite the city of Hankow. The latter is in effect but a suburb of Wu-chang, another portion on the north bank of the

river being Hanyang. It is the great emporium for the tea exported by way of Shanghai. Pop. variously estimated from 500,000 to 1,000,000.

Wu-hu, woo'hoo', China, a treaty-port, opened in 1877, in the province of Ngan-hwei, on the right bank of the Yang-tse-kiang river, about 200 miles west of Shanghai. Some manufactures and a considerable trade are carried on. The number of vessels entered in 1901 was 2,002, with a total tonnage of 2,098,840. The total value of the imports in that year was \$5,776,810, comprising cottons, opium, sugar, kerosene, bags, woolens, metals, etc.; and the exports were valued at \$4,080,145, including rice, rape-seed, raw silk, wheat, feathers, beans, ground-nuts, etc. Wu-hu suffered severely in the Tai-ping rebellion. Pop. 92,000.

Wu Ting-Fang, woo'ting'fäng', Chinese diplomatist: b. near Canton. After education at Canton and Hong Kong, he went to England in 1874 for the study of law, having found Chinese merchants greatly at disadvantage through ignorance of the English language and law, and was the first Chinese to be made a barrister (1877). He established himself in successful practice at Hong Kong, where his services proved of great value. For several years he was a secretary on the official staff of Li-Hung-Chang, but first came prominently into notice as secretary of the peace commission to Japan after the war with that country. His skill in these diplomatic negotiations obtained for him the post of envoy extraordinary and minister plenipotentiary to the United States, Spain, Mexico, and Peru (May 1897). During the Boxer troubles in the summer of 1900 he made skilful representations to the state department, for which when no news was obtainable from Peking, he transmitted a message to Minister Conger and secured an answer. He used English fluently; was stated to have been the first Chinese minister to address American audiences, which he did frequently; wrote numerous articles for American magazines; and received the degree of LL.D. from the University of Pennsylvania. In 1902 he was recalled, and in 1903 became vice-president of the newly established Chinese "board of commerce."

Wulf'enite, native lead molybdate. It is generally admitted that the best specimens of this mineral are among the most beautiful minerals known. It crystallizes in hemimorphic tetragonal crystals. They are usually in square tabular plates, sometimes very thin and transparent, but occasionally in elongated pyramidal forms and nearly opaque. The mineral also occurs in crystalline masses. It is very brittle, has a hardness of about 3 and is very heavy, its specific gravity ranging from 6.7 to 7.0. Its lustre is resinous to adamantine, and colors are various shades of yellow, orange, red, grayish or greenish. It is associated with other lead ores at many localities, as in Austria-Hungary, and New South Wales, but the United States localities are far more important. Magnificent specimens occur in the Red Cloud and Mammoth mines in Arizona, in the Organ Mountains, New Mexico, at Eureka, Nevada and Tecoma, Utah. It was named in honor of the Austrian mineralogist, Wulfen. It has been used to a limited extent as an ore of molybdenum.

Wulfstan, wulf'stan, Wulstan, or Wolstan, (1) Anglo-Saxon prelate: b. Long Itchington, Warwickshire, about 1007; d. Worcester 18 Jan. 1095. Educated at Evesham and Peterborough, he became a monk in the monastery of Worcester and in 1062 was consecrated bishop of Worcester. He was one of those who submitted to William the Conqueror at Berkhamstead in 1066, and was allowed to retain his see. The crypt of the present Worcester cathedral represents the church which Wulfstan caused to be erected between 1084 and 1089. He was a man of saintly character and loyal devotion to his work, and he is credited with having induced the merchants of Bristol to stop their traffic in slaves. He assisted in the Domesday survey, and led the defense of Worcester against the rebellious nobles commanded by Roger de Montgomery. He was buried in Worcester cathedral, and was canonized in 1203, his day being 19 January. Consult, 'Life,' by William of Malmesbury, 'De Gestibus Pontificum.' (2) Wulfstan: b. about 950; d. 1023. He was archbishop of York, and has been regarded as the author of 'Wulfstan's Homilies,' a series of discourses in Anglo-Saxon, first printed in 1701. (3) Wulfstan of Winchester, a monk of the 9th century, who wrote metrical lives of St. Swithin and St. Ethelwold.

Wülker, vül'kär, Richard Paul, German philologist: b. Frankfort-on-the-Main 29 July 1845. He was educated in Berlin, Leipsic and Marburg and in 1875 was made professor of English at the University of Leipsic. He is the author of 'Das Evangelium Nikodemi' (1872); 'Altenglisches Lesebuch' (1874-80); 'Kleinere angelsächsische Dichtung' (1882); 'Geschichte der englischen Litteratur von den ältesten Zeiten bis zur Gegenwart' (1896); 'Bibliothek der angelsächsischen Prosa' (1899).

Wundt, voont, Wilhelm Max, German physiologist and philosopher: b. Neckarau, Baden, 16 Aug. 1832. He was educated at Heidelberg, Tübingen and Berlin, and in 1865 became assistant professor of philosophy at Heidelberg. He was subsequently professor of philosophy at Zürich and in 1875 was appointed to a similar post at Leipsic. Among his numerous works are: 'Science of Muscular Motion' (1858); 'Manual of Human Physiology' (1864, 4th ed. 1878); 'Ethics' (1886, 2d ed. 1892); 'The Human and the Animal Soul' (2d ed. 1892, in English 1894); 'Logic' (1880-3, 2d ed. 1892-5); 'Elements of Physiological Psychology' (1874, 4th ed. 1893); 'System of Philosophy' (1889, 2d ed. 1897); 'Outline of Psychology' (1896, 2d ed. 1897, in English 1894); etc. As a physiologist he advanced psychology by his work, and as a philosopher introduced the inductive method into sciences previously purely speculative (for example, logic and ethics), and sought to advance psychology by exact measurements (as of the time needed by a nerve stimulation to reach consciousness and become a percept).

Wupper, voop'pär, Germany, a river in the governments of Cologne and Düsseldorf of the Prussian province of the Rhine. It rises on the Westphalian frontier, and flows first northwest and then southwest, joining the Rhine between Cologne and Düsseldorf after a course of about 60 miles. It is not navigable for vessels of any size, but it provides considerable power for man-

ufacturing purposes. Its valley is the most populous in Germany, and contains the important industrial towns of Barmen, Elberfeld, and Solingen. In its upper course it is called the Wipper.

Wurdha, wūr'da, India. See **WARDHA**.

Wurmser, voorm'zēr, **Dagobert Sigmund**, COUNT VON, Austrian general: b. Alsace 22 Sept. 1724; d. Vienna 22 Aug. 1797. He served three years in the French army, but left it for the Austrian service, where he commanded a hussar regiment during the Seven Years' war, attaining the rank of major-general. During the Bavarian war of succession he commanded a special corps of the army in Bohemia, and after the peace was made commanding general in Galicia, and in 1787 general of cavalry. By the outbreak of the French Revolution his family lost their estates in Alsace. In May 1796, the critical condition of affairs in Italy after the defeat of Beaulieu led to the appointment of Wurmser to the command of the second Austrian army destined to act against Bonaparte. At the head of 60,000 men, he obliged the French to raise the siege of Mantua; but the defeat of his main body at Castiglione, Roveredo, and Bassano, rendered his situation extremely critical. He finally forced his way into Mantua, of which the blockade was resumed. A third Austrian army was sent into Italy, but the defeat of Arcole prevented it from relieving him; and at length, in February 1797, seeing the impossibility of any longer maintaining the defense, Wurmser surrendered Mantua to Napoleon.

Wuro'ra, India. See **WARORA**.

Württemberg, vürt'tēm-bērg, or **Württemberg**, Germany, a southwestern state and kingdom of the empire, between Bavaria, Baden, Hohenzollern, and the Lake of Constance, which separates it from Switzerland; area, 7,528 square miles. It was formerly included in the territory of Swabia (q.v.). Except a few tracts in the south, the surface is hilly and even mountainous. In the west the Schwarzwald, or Black Forest, forms part of the boundary, and the Alb or Rauhe Alp, forming part of the Franconian Jura, covers an extensive tract. The country belongs in large part to the basin of the Rhine, being drained northward into that river by the Neckar, while the Danube flows across the southern districts. A part of the Lake of Constance is also included in Württemberg. The climate is temperate. In the lower and more favorable districts the fig and melon ripen in the open air, and the vine, cultivated on an extensive scale, produces several first-class wines; maize, wheat, hops, tobacco, and fruit, which is employed in cider making, are largely cultivated. About a third of the country is under forests, which consist chiefly of oaks, beeches, and pine. Of minerals, the most valuable are iron and salt, both of which are worked by the government; the others are limestone, gypsum, alabaster, slate, mill-stones, and potter's-clay. The manufactures consist chiefly of cotton, woolen, and linen goods, paper, wooden clocks, toys, musical instruments, and chemical products. The government is a hereditary constitutional monarchy, the executive power being lodged in the sovereign, and the legislative jointly in the sovereign and a parliament, composed of an upper and a lower chamber. The latter, which is elected

every six years, is composed of 93 members. The yearly revenue from all sources is about \$17,500,000, and the public debt, the bulk of which was incurred in constructing the state railways, is about \$140,000,000. Württemberg is represented in the Bundesrath by 4 members, and in the Reichstag by 17. There is no exclusively established religion, but the king is invested by the constitution with the supreme direction and guardianship of the Evangelical Protestant Church. Education is generally diffused, and the centre of the educational system is the University of Tübingen. Besides Stuttgart (the capital), the chief towns are Ulm, Heilbronn, and Esslingen. The history of the state is of little general interest. Previous to the Napoleonic era the rulers had the title of duke, but in 1806, by the favor of Napoleon, the then duke gained a great accession of territory, as well as the title of king. In the subsequent arrangement of the European states by the Congress of Vienna the territorial accessions were confirmed and the kingly title formally recognized. In the war of 1866 Württemberg sided with Austria against Prussia. It became a member of the German Empire on its foundation in 1871. Pop. (1900) 2,169,480, including nearly 12,000 Jews.

Wurts, John, American legal writer: b. Carbondale, Pa., 10 July 1855. He was educated at Yale and after traveling in Polynesia as a newspaper correspondent (1876-7) was graduated from the Yale Law School in 1884 and practised his profession in Jacksonville, Fla., 1884-96. He is now (1904) professor of the law of real property and equity at Yale, and has published 'The Anti-Slavery Movement with its Relation to the Federal Constitution' (1883); 'Washburn on Real Property' (1902); etc.

Wurtz, würtz, **Charles Adolphe**, French chemist: b. Strasburg, 26 Nov. 1817; d. Paris 12 May 1884. He went to Paris in 1845, in 1851 became professor at the Agronomic Institute, Versailles, in 1853 was made professor of organic chemistry at the Sorbonne and professor of toxicology at the Ecole de Médecin. From 1866 to 1876 he was dean of the Sorbonne faculty of medicine. Among his numerous works on chemistry are: 'La théorie atomique' (1878); 'Leçons élémentaires de chimie moderne' (1868); 'Traité de chimie biologique' (1885). Consult: Friedel, 'Notice sur la vie et les travaux de C. A. Wurtz' (1884).

Wurtz, Henry, American chemist: b. Easton, Pa., 5 June 1828. He was graduated from Princeton in 1848, studied further at the Lawrence Scientific School of Harvard, was State chemist of New Jersey 1854-6, chemical examiner in the United States Patent Office 1859-61, and from 1871 to 1875 edited the 'American Gas Light Journal.' In 1888 he entered the employ of T. A. Edison (q.v.), as chemist, and has since made several important chemical discoveries, chief of which is that of the geometrical laws of the condensation of chemical modules.

Wurtzite, in mineralogy, a dimorphous form of zinc blende. Crystallization, hexagonal; hardness 3.5 to 4; specific gravity, 3.98; lustre, resinous; color, brownish black; streak, brown; composition, a sulphide of zinc; ZnS; occurrence, in a silver mine near Oruro, Bolivia, in Portugal, Peru, and near Butte City, Montana.

WÜRZBURG — WYANT

Würzburg, vürts'boorg, Germany, a town in the northwest of Bavaria, capital of the government of Lower Franconia, beautifully situated on both banks of the Main, here spanned by an old bridge adorned with statues of saints, and by two modern bridges. The old fortifications have been demolished, and the site laid out in fine promenades. There was formerly a fortress on the Marienberg, a hill about 800 feet high overlooking the town. The most important edifices are the richly-decorated cathedral, belonging to the 9th and subsequent centuries; several other fine old churches; the royal residence, a fine 18th century edifice of great size, in the style of the palace of Versailles; the Julius hospital, adjoining which are the botanic garden and several of the medical departments of the university; the town-house, university, government buildings, railway station, barracks, palace of justice, etc. The university, founded in 1402, is celebrated for its medical faculty, to which more than half the students belong. The university library numbers about 300,000 volumes. There are also two gymnasiums, a real-gymnasium, a real-school, a polytechnic union, and other educational institutions. The manufactures are varied, and the trade is important. Well-known wines (Steinwein, Leistenwein) are produced here. Würzburg formerly gave its name to an independent bishopric, which was founded about 742, and richly endowed by the Frankish and German rulers. Ducal power in East Franconia was granted to the bishop in 1120. In 1803 the bishopric was annexed to Bavaria, but in 1805 again severed from it and erected into an electorate in favor of Grand-Duke Ferdinand of Tuscany. In 1806 it became a grand duchy, but in 1815 was restored to Bavaria. Pop. (1900) 75,497.

Wurzburger, wérz'bër-gër, **Julius**, American journalist: b. Baireuth, Germany, 1819; d. New York 14 Sept. 1876. The son of a merchant, he received a thorough education, and studied literature and history at the University of Erlangen. The year of revolution, 1848, found him editor of the Baireuth 'Tageblatt.' He then removed to Munich, where his ardent advocacy of the liberal movement attracted the attention of the ministry and he was banished in 1849 from Bavaria. Soon after Louis Napoleon had declared himself emperor, Wurzburger came to New York, and here established a connection with the *Staatszeitung* which continued from 1856 to 1875. As editor of its 'Sonntagsblatt' he exercised a wide influence.

Wurzen, voorts'ën, Germany, an old town in Saxony, on the Mulde, here crossed by a railway bridge and a foot-bridge, 60 miles northwest of Dresden. It has a restored cathedral of the 12th century, with two towers; an ancient castle; a royal gymnasium; many other educational institutions; a municipal hospital; etc. The industries include iron-founding and the manufacture of machinery, paper, carpets, furniture, cigars, etc. Wurzen was twice burned by the Swedes during the Thirty Years' war. Pop. (1900) 16,615.

Wushkum (from the name of their chief village), meaning a species of louse or flea, a tribe of the Chinookan stock of North American Indians. They call themselves *Tlaqluit*, and are the Echeloot of Lewis and Clark and the Wish-

am, Wishram, etc., of other writers. They occupy the north bank of Columbia River, Washington, from Tenino to the neighborhood of White Salmon River. They subsist largely on salmon, and are not reservation Indians, although they took part in the Yakima treaty of 1855. Their number is not known, but it is small.

Wuthering (wuth'er-ing) **Heights**, a novel by Emily Brontë, published in December 1847, under the pseudonym "Ellis Bell," only a year before her death. The scene of the tale is laid in the rugged moorland country in the north of England, with which the author was familiar from childhood; the persons are drawn from types only to be found, perhaps, in that country,—outlandish characters in whom gentility and savagery are united.

Wyandotte, wi'an-döt, Mich., city in Wayne County; on the Detroit River, and on the Grand Trunk, the Michigan Central, the Detroit Southern, and the Lake Shore & Michigan Southern R.R.'s; 12 miles south of Detroit. It has alkali works in which there are 1,200 employees; rug and fur coat factory, 300 employees; ship-building works, 500; baking soda and starch factory, 75; salt works, 300; and a number of other manufacturing establishments. The two banks have a combined capital of \$100,000; and the annual business is about \$900,000. There are 10 churches, a high school established in 1873, three public schools, four parish schools, and a public school library. The government is vested in a mayor and a council of six members elected annually in April. Wyandotte was settled before 1850 by Major John Biddle. It was platted in 1854, and in 1867 was incorporated. The government is administered under a charter of 1896. Pop. (1890) 3,817; (1900) 5,183.

J. D. HAVEN.

Editor 'Wyandotte Herald.'

Wyandotte Cave, in Crawford County, Ind., a natural formation, second in size to Mammoth Cave (q.v.), but having a greater number and variety of stalactites and stalagmites than any other cave in the United States. It has been explored for a distance of 23 miles. The chambers and galleries are numerous, some about 350 feet long and 180 feet high. Some of the remarkable features are Monument Mountain, about 175 feet high, and 75 feet above its crests is the grand dome. The Pillared Place contains several clusters of stalactites, and the Pillar of the Constitution, a large stalagmite 30 feet high and 75 feet in circumference. It has numerous beautiful crystals.

Wyant, wi'ant, **Alexander Helwig**, American artist: b. Port Washington, Tuscarawas County, Ohio, 11 Jan. 1836; d. New York 29 Nov. 1892. After trying the saddlery business, he turned to art, became a painter of landscapes at Cincinnati, exhibited in the National Academy of Design in 1865, was elected associate of the academy in 1868, and academician in 1869. In 1865 he went to Europe, where he was a pupil of Hans Gude at Karlsruhe; and before his return he studied also for a few months in England and Ireland. He attained high rank in landscape art, painting almost exclusively American scenes, and being particularly successful in views from the Adirondack wilderness. He was a founder of the American Water-Color Society. Among his works are: 'Scene on the

WYATT — WYCHERLEY

Upper Susquehanna (1869); **'Pool on the Ausable'** (1871); **'In the Adirondacks'**; **'A North Woods' Brook'**; **'An Old Clearing'**; **'Pool in the North Woods'**; **'New Jersey Meadows'** (1872); **'Sunset on the Prairie'** (1876); **'Reminiscence of the Connecticut'** (1878); **'Evening'** (1885); **'Sunset, near Killarney'** (1886); **'October Day'** (1892). His chief characteristics are subtle tones, the evanescent moods of nature that he was quick and able to catch, and a delicate quality of workmanship.

Wyatt, wi'at, James, English architect: b. Burton Constable, Staffordshire, 3 Aug. 1746; d. Marlborough, Wiltshire, 5 Sept. 1813. He was taken to Rome in 1760 by Sir William Bagot, and during the next six years studied architecture in that city and in Venice. Returning to London, he brought himself into notice by his designs for the Pantheon, in Oxford street, a building for many years famous as the rendezvous of the fashionable world. He received innumerable commissions for private residences in all parts of the kingdom; but his designs, for the most part in a sort of Græco-Italian style, have little at the present day to recommend them. About 1782 he turned his attention to Gothic architecture, being one of the first to attempt its revival; and for many years was employed as a restorer of cathedrals and parish churches, in the course of these labors making sad havoc at Salisbury, Hereford, Durham, and elsewhere. It must be said, however, that his imperfect conceptions of Gothic art were shared by his contemporaries and approved by the taste of his time, in large measure. His most famous work in this style was Fonthill abbey, erected for Beckford in 1795. He held the position of surveyor-general subsequent to 1796, and in 1802-3 was president of the Royal Academy.

Wyatt, Sir Matthew Digby, English architect and art writer: b. Rowde, near Devizes, Wiltshire, 1820; d. London 21 May 1877. He made a diligent study of the architecture of Italy, France, and Germany, returning to England in 1846 to publish his **'Geometrical Mosaics of the Middle Ages'** (1848). In 1856 he was appointed architect to the East India Company, and made many important designs for public works in Great Britain and India; in 1866 was awarded the royal gold medal of the Royal Institute of British Architects; and in 1869 was knighted and made Slade professor of fine arts at Cambridge. His chief books are: **'Metal Work and its Artistic Design'** (1852); **'Industrial Arts of the 19th Century'** (1853); **'Art Treasures of the United Kingdom'** (1857); **'Fine Art'** (1870); **'Architect's Handbook in Spain'** (1872).

Wyatt, Richard James, English sculptor: b. London 3 May 1795; d. Rome 29 May 1850. He entered the Royal Academy as a student, afterward worked for a time in the studio of Bosio in Paris, and ultimately completed his professional education under Canova at Rome. In the last city he took up his permanent residence from 1821, making only one brief visit to England in 1841. He is one of the best English sculptors in the delineation of poetical and classical subjects. Among his works are **'Penelope'**; **'The Huntress'**, and **'Flora'**, besides several memorials.

Wyatt, Sir Thomas, English poet: b. Kent about 1503; d. Sherborne, Dorsetshire, 11 Oct. 1542. He was graduated from Cambridge in 1518, may have studied at Oxford, and subsequently went on his travels to the Continent. After his return to England he appeared at court, where the reputation he had already acquired as a wit and a poet introduced him to the notice of Henry VIII., who retained him about his person and knighted him in 1537. He was employed on several diplomatic missions to different powers, and was a friend of Thomas Cromwell (q.v.), in whose fall he ran some risk of being involved. In 1542 he was returned to Parliament as knight of the shire for Kent. A close student of foreign literature, Wyatt introduced the sonnet into England from Italy. In this he is commonly associated with Henry Howard, Earl of Surrey, but is more correctly to be regarded as the pioneer (see SURREY, EARL OF). None of Wyatt's verse, sacred or secular, appeared in his lifetime. Some of the secular poems were printed (96 are assigned to Wyatt) in the **'Songes and Sonettes'** (1557) of Richard Tottel, commonly known as **'Tottel's Miscellany.'** There are among the extant works 31 sonnets, and satires in heroic couplets, imitated from Persius and Horace. Wyatt's poems evince more elegance of thought than imagination, while his mode of expression is far more artificial and labored than that of Surrey. Consult Nott's edition of Wyatt and Surrey with the elaborate memoir prefixed thereto (1816); also the article by Churton Collins in T. H. Ward's **'English Poets'** (1883), and Simond's **'Sir Thomas Wyatt and his Poems'** (1889).

Wyattville, wi'at-vil, Sir Jeffrey, English architect, nephew of James Wyatt (q.v.): b. Burton-on-Trent 3 Aug. 1766; d. London 18 Feb. 1840. He designed and superintended the alterations in Windsor Castle, begun in 1824, and his name was changed from Wyatt to Wyattville on the occasion of his being knighted in 1828.

Wycherley, wich'er-ly, William, English wit and dramatist: b. Clive, Shropshire, about 1640; d. London 1 Jan. 1716. About 1655 he went to France for his education, but he returned to England a short time before the Restoration, and was entered a gentleman commoner of Queen's College, Oxford, which he left without a degree, and took chambers in the Middle Temple. He paid, however, little attention to the law, but became a man of fashion in the town, and made himself known as author of **'Love in a Wood, or St. James's Park,'** a comedy, published about the end of 1671. This piece brought him into much notice, and his popularity was increased by comedies that soon after followed: **'The Gentleman Dancing-master,'** published in 1673; **'The Country Wife,'** produced in 1672 or 1673, and **'The Plain Dealer,'** 1674. He became a favorite of the meretricious Duchess of Cleveland, and was much regarded by Villiers, the witty and profligate Duke of Buckingham. About 1680 he improved his circumstances by marrying the Countess of Drogheda, a young, rich, and beautiful widow. At her death soon after she settled her fortune upon him; but, his title being disputed, the costs of law and other encumbrances produced embarrassment, which ended in arrest. He re-

mained in confinement seven years, until released by James II., who, it is said, was so pleased with his comedy of 'The Plain Dealer' that he ordered his debts to be paid, and added a pension of £200 per annum, which he lost at the revolution. The succession to his father's estate, which was strictly entailed, does not appear to have relieved him from the embarrassments into which he had again fallen, and from which he found a deliverance only a few days before his death in marrying a young woman with a fortune of £1,500. Besides the plays already mentioned he wrote poems of no value or interest. His plays are excessively licentious. He was a friend of Dryden, and in his later years of Pope, but Pope's statements regarding their connection are not much to be depended on. Among latest editions of his plays is that by W. C. Ward (1893).

Wyckoff, wi'kōf, Walter Augustus, American sociologist: b. Mainpuri, India, 12 April 1865. He was graduated from Princeton in 1888, and after further study in Europe began in July 1891, the life of a day laborer, working his way from Connecticut to California and spending 18 months in this manner. His aim was to study from the inside the economic conditions surrounding American wage-earners, and the immediate outcome of his experiment was his three sociological works: 'The Workers—the East' (1897); 'The Workers—the West' (1898); 'A Day with a Tramp and Other Days' (1901). In 1893-4 he went around the world twice as a private tutor, in 1895 was made a lecturer on political science at Princeton, and in 1898 became an assistant professor of political economy there.

Wycliff, wi'klif. See WICLIF, JOHN.

Wye, wi, a river partly in Wales, partly in England, with its source in Plynlimmon, Montgomeryshire. After a circuitous and winding course of about 130 miles, having passed through Radnorshire, Herefordshire, and separated Monmouth from Gloucestershire, it falls into the Severn below Chepstow. It is distinguished for the beauty and variety of its scenery, especially in the neighborhood of Tintern Abbey. The tide at Chepstow sometimes rises 46 feet. Large vessels cannot ascend beyond Chepstow Bridge, but barges of from 18 to 30 tons reach Hereford. Other towns on the river are Monmouth, Ross, and Builth.

Wyeth, wi'ēth, John Allan, American surgeon: b. Marshall County, Ala., 26 May 1845. During the Civil War he served as a private in the Confederate army, was taken prisoner and held for 15 months. In 1869 he was graduated in medicine at the University of Louisville, and in 1873 from the Bellevue Medical College, where he was assistant demonstrator in anatomy 1873-4. He was surgeon to the Mount Sinai Hospital 1880-97, and in 1882 founded the New York Polyclinic Medical School, the first American post-graduate medical school. He has published 'Essays on Surgical Anatomy and Surgery'; 'Text Book on Surgery' (1888); 'Life of General Nathan Bedford Forrest' (1899); etc.

Wykeham, wi'k'am, William of. See WILLIAM OF WYKEHAM.

Wylie, wi'li, Robert, American artist: b. Isle of Man 1839; d. Pont Aven, Brittany,

France, 1877. He was brought to this country when a child, and after some study in the Pennsylvania Academy was sent by his trustees to study in France in 1863. Settling at the village of Pont Aven he was presently surrounded by a colony of artists. In the Paris Salon of 1872 he obtained a second-class medal, but not till after his death did his paintings attract much attention. His 'Death of a Vendean Chief' (1876) hangs in the Metropolitan Museum, New York.

Wyman, wi'man, Jefferies, American anatomist: b. Chelmsford, Mass., 11 Aug. 1814; d. Bethlehem, N. H., 4 Sept. 1874. He was graduated from the Harvard Medical School in 1833, was professor of anatomy and physiology at Hampden-Sidney Medical College, Richmond, Va., 1843-7, and Hersey professor of anatomy at Harvard from 1847 till his death. He established there the Museum of Comparative Anatomy and for many years was indefatigable in efforts for its increase, was president of the Boston Society of Natural History 1856-70, became curator of the Peabody Museum, Cambridge, in 1866, and published many scientific papers. He was one of the earliest American supporters of the theory of evolution.

Wyman, Robert Harris, American naval officer: b. Portsmouth, N. H., 12 July 1822; d. Washington, D. C., 2 Dec. 1882. He entered the navy in 1837, and while attached to the Gulf Squadron during the Mexican War, took part in the siege and capture of Vera Cruz and the expeditions that captured Tuspan and Tampico. He was stationed at the naval observatory in Washington in 1848-50 and 1853-4, and in the Civil War commanded the Yankee and Pawnee and the Potomac flotilla in 1861; and the Santiago de Cuba on blockading duty in 1862-4. He became commodore in 1872, and rear-admiral in 1878; and was commander-in-chief of the North Atlantic Station in 1879-82.

Wyman, Walter, American surgeon: b. St. Louis, Mo., 17 Aug. 1848. He was graduated at Amherst in 1870, and at the St. Louis Medical College in 1873; served in city hospitals 1873-5, and since 1876 has been in the Marine Hospital service, being made assistant surgeon in 1876, chief medical purveyor of the quarantine division in 1888, and supervising surgeon-general in 1891. He was an earnest advocate for the sanitation of ports not only in the United States, but in the West Indies and South America, holding that if this were enforced yellow fever would be entirely eradicated from the Western hemisphere. On his recommendation the government set apart a large tract of land at Fort Stanton, New Mexico, for a hospital whither all consumptive patients in the United States marine hospitals could be transferred.

Wynants, wi'nānts, or Wijants, Jan, Dutch painter: b. Haarlem between 1615 and 1620; d. about 1680. Very little is known of his life except that he was master of Adrian Vandervele, Wouwerman, and other eminent painters, and that he was naturally indolent and given to pleasure. His works are consequently few, but are highly valued for their technical merits. They consist of landscapes of small size, the figures and cattle in which were often executed by other hands.

WYNDHAM—WYOMING

Wyndham, win'dam, **SIR Charles**, English actor: b. 1841. He was at first educated for the medical profession, and coming to this country served for a time as surgeon in the United States army during the Civil War. Later he went upon the stage, appearing with John Wilkes Booth, and then, returning to England, made his debut in London in 1868 in light comedy. In 1876 he obtained control of the Criterion Theatre in London and in 1899 opened Wyndham's Theatre there. He was knighted in 1902. He has made several visits to this country on theatrical tours. Consult Scott, 'The Drama of Yesterday and To-day' (1899).

Wyndham, George, English cabinet officer: b. London 29 Aug. 1863. He was educated at Eton and Sandhurst Royal Military College. He served through the Suakim campaign and at Cyprus in 1885, and was private secretary to A. J. Balfour (q.v.) 1887-92. He also sat in Parliament for Dover from 1889, was parliamentary under-secretary of state for war 1898-1900, became chief secretary for Ireland in 1900 and entered the cabinet in 1902. In March 1903 he introduced the Irish land purchase bill subsequently passed. He has published an edition of 'North's Plutarch' in the 'Tudor Classics' (1894); and 'Shakespeare's Poems' (1898).

Wyndham, SIR William, English statesman: b. Orchard-Wyndham, Somerset, 1687; d. Wells, Somerset, 17 July 1740. He was educated at Oxford, and entering the House of Commons for his native county, identified himself with the Tories, became secretary at war in 1711, and in August 1713 was transferred to the office of chancellor of the exchequer. He was suspected of treasonable relations with the Pretender, and lost his office on the death of Queen Anne. On the outbreak of the rebellion in Scotland under the Earl of Mar in 1715, an order for Wyndham's confinement was issued, and he was arrested at his house in Somerset, but escaped. A reward of \$5,000 was offered for his apprehension. After lurking for some time in disguise he surrendered himself and was committed to the Tower. Released without a trial, he remained till his death a leader of the parliamentary opposition to the ministry of Sir Robert Walpole. He was a very graceful, clear, forcible, and spirited orator.

Wynne, win, **Charles Whitworth**. See CAYZER, CHARLES WILLIAM.

Wynne, Madelene Yale, American author, artist, and metal worker: b. Newport, N. Y., 25 Sept. 1847. She was a daughter of Linus Yale, inventor of the Yale lock; studied art in the Boston Art Museum, the Art Students' League, New York, and with George Fuller. She has published 'The Little Room and Other Stories.'

Wyntoun, win'ton, **Andrew**, Scottish rhyming chronicler: b. about 1350; d. after 1420. He was a canon regular of the priory of Saint Andrews, and was in 1395 prior of St. Serf's Inch, in Lochleven, probably holding this office till his death. Wyntoun's 'Orygynale Cronykil of Scotland' is the first historical record in the Scottish vernacular. It received little attention till 1795, when David MacPherson published an annotated edition of a part of it. David Laing edited a complete edition of this

work, 1872-9, and an edition from the Wemyss Manuscript has been prepared for the Scottish Text Society. Wyntoun's 'Chronicle' bears the usual character of the historical writings of the age in the indiscriminate mixture of tradition with history, but he appears to have been faithful to his authorities, whom he sometimes literally transcribes. Wyntoun's scholarship appears to have been considerable, and the candor and generosity with which he speaks of the enemies of his country, are commendable.

Wyoming (Indian, *Maughwauwama*, meaning "big plains"), a State of the United States, in the Rocky Mountain region, between the parallels lat. 41° and 45° N., and between lon. 104° 3' and 111° 3' W. It is bounded on the north by Montana, east by South Dakota and Nebraska, south by Colorado and Utah, and west by Utah and Idaho. The boundary lines are all straight. The greatest extent is from east to west, 355 miles; from north to south is 276 miles. Area, 97,800 square miles. Wyoming ranks sixth in size among the States of the Union.

Topography.—The elevation of the State averages from 5,000 to 7,000 feet above sea-level, and it is traversed by the main chains or spurs of the Rocky Mountain Range. From the plateau lands rise a number of lofty ranges and peaks, the summits of which are from 8,000 to nearly 14,000 feet above the sea. The largest mountain masses, or groups of mountains, are in the southeastern and northwestern parts of the State. In the northeast is the isolated group called the Black Hills, a portion of which extends into South Dakota. In the southwest and along the southern border are the Sierra Madre, spurs of the Uintah Mountains, several buttes, and a number of low mountain ranges. The chief ranges of the southeast are Medicine Bow, Laramie, Seminole, Rattlesnake, Sheep, and Snowy. The short ranges, Sheep and Snowy, extend northeast and southwest, but the other ranges of the southeast extend northwest and southeast. In the northwest part of the State the principal ranges are Shoshone, Teton, Snake River, Gros Ventre, Snow, and Owl Creek. In the northern part is a wedge-shaped group, broadest at the northern boundary, and ending abruptly about 100 miles south. The longest and most prominent range of this group is the Big Horn. Extending northwest and southeast across the western central part of the State are the Wind River and the Green Mountains. Some of the most prominent elevations in the State are Frémont, snow-capped all the year, and nearly 14,000 feet, Sheridan (13,691 feet), Atlantic (12,700 feet), Grand Teton (q.v.), Ferris, and Union. The Continental Divide crosses the State from the middle of the southern boundary to the northwestern corner, extending through the Yellowstone National Park (q.v.).

The principal plains are Laramie in the southeast, the Platte and Cheyenne plains in the east, which extend west to near the central part of the State; and Red Desert in the southwest. The great natural curiosity of the State is the region included in and adjacent to the Yellowstone Park. Numerous small parks and several passes have been found amid the mountains; just southeast of the National Park is the Two Ocean Pass, near which are the headwaters of streams whose waters find their

WYOMING

way to the Atlantic and Pacific oceans. (See **ROCKY MOUNTAINS.**)

Hydrography.—The State is noted for being the source of many of the head streams of the three great river systems of the United States: Mississippi, Columbia, and Colorado. The Yellowstone River (q.v.) and its tributaries, Big Horn, Powder, and smaller streams, drain the northern portion of the State and carry the waters to the Missouri. The Little Missouri, Platte, and Cheyenne are the chief rivers which drain the eastern portion, and which belong also to the Mississippi Basin. In the southwest is the Green River, a tributary of the Colorado. The west and northwest sections are drained chiefly by the Snake, or Shoshone, a branch of the Columbia. (In separate articles on the rivers which have their rise in this State descriptions are given of the cañons, cascades, and waterfalls.)

The largest lakes are the Yellowstone (q.v.), Jackson, and Shoshone, all in the northwest. There are many small lakes amid the mountains, bodies of clear water surrounded by wooded mountain regions of great beauty.

Geology.—The surface rock of several ranges, notably Wind River, Cheyenne, and Powder, is chiefly a cretaceous stratum. Eocene deposits are found in the southwest, lava and igneous rocks in the northwest, and crystalline rocks (Archæan) on the crests of the mountains that cross the interior. Palæozoic and Lower Mesozoic strata appear in regular bands in the Wind River and adjacent ranges. Deep fissures and rugged sides are features of nearly all the mountains of the State. The lower slopes of the Laramie Range and a portion of the Laramie Plains are covered with the later Tertiary deposits. The geological formation of every age may be found in Wyoming, notably the tertiary, carboniferous, cretaceous, eozoic, silurian, triassic, jurassic, Devonian, and volcanic. (See **ROCKY MOUNTAINS.**)

Minerals and Mining.—Wyoming has gold, silver, and most of the valuable minerals found in the Rocky Mountain region. In 1900 there were mined 1,665 ounces of fine gold, valued at \$34,200; 200 ounces of fine silver; 14,501 short tons of coke, valued at \$43,503; granite, \$8,700; sandstone, \$27,671; limestone, \$3,065. In 1902 the North American Copper Company began operations at Grand Encampment. The oil fields promise to be most productive. In 1900 the crude petroleum output was 5,400 barrels, valued at \$34,000. On 1 Sept. 1903 oil was discovered near Evanston. A lubricating oil of superior quality has been found in the central part of the State. Thus far coal has been the chief product of the mines, and so much attention has been given to coal mining in this State that the quantities procured have steadily increased. In 1868 the entire quantity of coal mined was 6,925 short tons; it increased constantly until, in 1887, 1,170,318 tons were produced; in 1900, 3,837,392 short tons, valued at \$4,742,525. The output of the coal mines in 1903 amounted to \$6,064,620. In 1901 the State ranked 12th in the Union in coal production, with the counties of Sweetwater and Uinta taking the lead. The coal reserves are so enormous that they are likely to be among the most important factors in the development of the State in the future.

Climate.—The extremes of temperature

exist for a short period each year. The records show the maximum 116° above zero and the minimum 44° below zero, but those extremes are rare. The highest generally is 100° and the lowest 30° below zero. The mean temperature for January is 18.1° in the northern part of the State, and 25.1° for Cheyenne and vicinity. The mean temperature for July is 67° for the whole State. The extreme cold is not severe on account of the dryness. The greatest amount of rainfall is between March and June; the snowfall is light, and to insure crops in all the productive localities, except along the rivers, irrigation is necessary. The State is remarkably free from all conditions that tend to unhealthfulness, especially malaria and kindred diseases.

Soil.—The soil of nearly all the river valleys is a dark loam, and most fertile. On the higher lands and the lower mountain slopes there is a sandy loam, some of which is productive, as above stated, but irrigation is necessary. In the Red Desert of the southwest the saline deposits have rendered the soil almost unfit to support any but the lowest forms of vegetation. Greasewood and salt-sage are the chief forms of vegetation found here.

Flora and Forest Productions.—The vegetation common to the Rocky Mountain region is found here; the low shrubs, the grasses suitable for pasturage, on the foothills and lower slopes, fir, spruce, hemlock, pine, aspen, walnut, elm, ash, box-elder, red cedar, and along the streams, in places, cottonwood and willow. The wooded districts of the State cover only about 13 per cent of the entire area, or about 12,500 square miles. Of this timbered part of the State, 3,500 square miles are located within the boundaries of the Yellowstone National Park, and 5,207 square miles within the United States reserves. Yellow pine is found on the lower slopes of the Big Horn and Medicine Bow Mountains, and south of the Yellowstone Park. Considerable timber had been taken from the forest districts and has been found very valuable for many purposes. The timber manufactured into lumber, in 1900, was valued at \$831,558.

Fauna.—The animals found wild throughout the State are the black and the grizzly bear, wolf, prairie wolf, badger, wolverine, otter, porcupine, mink, civet, ermine, elk, deer, antelope, prairie dog, rabbit, and wild birds. (See **ROCKY MOUNTAIN FAUNA; AMERICA; UNITED STATES.**)

Agriculture and Stock Raising.—Crops cannot be raised without irrigation, except in small quantities along the streams, but with irrigation large crops have been produced. The most of the productive land is at a greater altitude than the fertile lands of any other State. This has a controlling effect upon the character of agriculture, the means used and the kind of productions. For a long time agricultural efforts were confined to grains and to sections where irrigation could be easily employed. This is still the case, in a great measure, but the quantity of land tilled has increased. In 1900 there were 8,124,536 acres of farm lands, of which 792,332 were cultivated for grains and vegetables. Grass grows in large portions of the State in fairly good quantities, particularly along the streams and where the lands are irrigated. Timothy and alfalfa are cultivated. It

WYOMING

is estimated that nearly half the State is suitable for grazing. The native grasses cure naturally, standing on the ground without harvesting, on account of the dry climate. Near the arable lands there are streams that can be used for irrigation. One canal fed by the Big Sandy River irrigates 270,000 acres. The reports of the United States Geological Survey give as the number of acres that may be reclaimed by irrigation 15,000,000. In 1891 the number of acres that had been reclaimed was 2,172,000, but the amount of reclaimed acreage is increasing each year. In 1902 irrigation canals for 210,359 acres were begun. A supply of good water is furnished by the melting snows on the mountain tops. Thus are formed quite large streams, from which water is taken, in irrigating ditches, and distributed over the fields. There are irrigated lands in various parts of the State; but more than half lies in the valley of the North Platte River. Wheat, oats, hay, and potatoes are the principal crops; the climate is too cold for corn. Vegetables and some of the hardy small fruits are raised. The amount and value of the chief crops for 1902 were about as follows:

	Acres	Bushels	Value
Wheat	23,130	543,555	\$ 449,280
Oats	36,179	1,302,444	651,222
Potatoes	3,702	396,114	241,630
Hay	160,324	264,535 tons	1,925,815

Northern Wyoming is a cattle and sheep raising section. The stock raised is of more value than the agricultural products. Great numbers of fine horses are raised, and many are sent each year to the markets in the Eastern States. Sheep are pastured on the mountain slopes in summer and on the plains in winter. In winter they subsist on the cured grasses; but sometimes the cold weather and snowstorms cause many to perish. Sheep raising in this State has increased greatly since 1900. The sheep are of a superior brand and the wool is an excellent quality. The number of stock in the State on 1 Jan. 1903 was as follows:

	Number	Value
Horses	113,444	\$3,282,736
Mules	1,481	78,292
Milch Cows	19,587	753,316
Sheep	5,826,158	14,306,695
Swine	15,983	168,780
Other stock	796,060	18,553,928

In the amount and value of the wool product, in 1903, Wyoming ranked second, Montana being first.

Manufacturing.—The chief manufactured products are railroad cars and supplies, lumber and lumber products, harness, saddles, boots and shoes, clothing, flour, lime, brooms, cement, tobacco and malt products. In 1900 (government census) there were 380 manufacturing establishments, capitalized for \$2,411,435, and employing 2,241 persons. The total value of the products marketed was \$4,381,240. Manufacturing has increased but slowly from year to year, owing to the great distances from markets and centres of trade, and to the meagre transportation facilities. The manufacturing industries are limited mostly to the production of articles for local consumption.

Transportation.—The Union Pacific Railroad enters from the southeast and crosses the southern part of the State. Several short branches extend from the main line to different towns; three run from Cheyenne, one to the north and two toward the south. At Granger, in the southwest, the road branches, one line going northwest into Idaho, the other southwest into Utah. The Chicago, Burlington, and Quincy Railroad crosses the northeastern part of the State. A branch from the Northern Pacific Railroad extends from Livingston, in Montana, to Cinnabar, at the entrance to the Yellowstone Park. There are no railroads in the central or western part of the State, and the towns of the interior are connected only by stage routes. In 1901 there were 1,279 miles of railroad. The rivers within the State limits are not navigable for commercial purposes. The transportation facilities are entirely inadequate for the needs of so large a State or for the development of its natural resources. Wyoming has less miles of railroad than any other State except Nevada.

Militia.—In 1900 there were in the State, of militia-age, 32,988 men. In 1903 the organized militia numbered 526 men, of whom 43 were commissioned officers.

Banks and Finance.—In 1904 there were in the State 16 national banks, 10 state, and 11 private banks with a combined capital of about \$2,000,000. In 1890, when Wyoming became a State, a bonded debt was incurred, to the amount of \$320,000, for the capitol at Cheyenne and other public buildings. On 1 Jan. 1902 the debt had been reduced to \$280,000. The main sources of revenue are direct tax, land leases and sales, and fees. The total receipts for the fiscal year ending 30 Sept. 1902 was \$478,758.12; the expenditures, \$294,636.53. The debt is being reduced each year.

Charitable and Penal Institutions.—There is a State Board of Charities and Reform which has general oversight over and control of the charitable institutions of the State, with ample correctionary powers. Indoor relief has not been provided to any large extent, as it has not been required. There is an asylum at Cheyenne for the deaf, dumb, and blind, but it is used as a home for soldiers and sailors, on account of lack of occupants of the kind for which it was intended. The State Insane Asylum is located at Evanston, and a State hospital at Rock Springs. The penitentiary, first located at Laramie, has been moved to Rawlins. Saint Joseph's (R. C.) Hospital is at Laramie.

Education.—The education of all the children in a country so sparsely settled is very difficult, but the State has attempted to establish schools wherever five pupils can be found to attend. The school term is 89 days (1900). During the year 1900 there were 14,512 children enrolled as having attended school some portion of the year, out of a total enrolment of all persons between the ages of 5 and 18 in the State, which amounted to 19,744. The average attendance was 10,160. There were 524 public school buildings and 570 teachers, and eight Roman Catholic schools. The public school property was valued at \$453,607. In 1902 the schools of the State were University of Wyoming (q.v.) at Laramie, 10 public high schools, one private high school (Academy of

WYOMING

the Holy Child at Cheyenne), one State normal school at Laramie, one business college, at Cheyenne, and three private academies. The university was the only institution in the State which had power to confer degrees. The governing officials of the schools of the State are a State superintendent of schools, city superintendents at Cheyenne, Laramie, and Rock Springs, and a county superintendent in each county.

The requirements for a license to practise medicine in the State are successful examination or a diploma from a college which belongs to the American Association of Colleges or the Homœopathic Institute, or the National Eclectic Medical Association, or any college of similar standing in a foreign country. To practise dentistry the requirement is a diploma from any dental college recognized by the National Association of Dental Examiners.

Each school district elects its own trustees. Teachers' institutes are provided by law; sessions of from 4 to 10 days are held annually. Discrimination as to pay of teachers on account of sex is forbidden. Children between the ages of 6 and 12 years must attend school 12 weeks in each year. Girls may not work in the mines; boys under 14 years of age may not work in the mines. Indian government schools have been established, and four private schools for the Indian boys and girls.

Government.—Under the State constitution both sexes are granted equal political rights and privileges, including the right to vote. All the State officers are elected for the term of four years and the treasurer is not eligible for reelection. The governor, secretary of state, auditor, treasurer, and superintendent of public instruction constitute the executive department. The salary of the governor is \$2,500; of each of the other officers \$2,000. The legislature holds biennial sessions, beginning on the second Tuesday of January of each odd year, and the term is 40 days. The legislature is composed of 23 senators and 50 members of the lower house. The salary of each member is five dollars a day and mileage. The capitol is at Cheyenne. The State has one representative and the usual two senators in the United States Congress.

Each one of the 13 counties has its own set of county officials.

Population.—The Federal Census of 1900 showed that Wyoming had, with one exception, the smallest population and the smallest density to the square mile of any State in the Union. The males numbered 58,184, the females 34,347. The foreign born numbered 17,415; Indians, 1,686; negroes, 940; Chinese, 461; Japanese, 393. The largest cities were Cheyenne, 14,082; Laramie, 8,207; Rock Spring, 4,363. State population (1870) 9,118; (1880) 20,789; (1890) 60,705; (1900) 92,531. B. ELLEN BURKE,

Editorial Staff, 'Encyclopedia Americana.'

History.—The stories of Spanish exploration have been much discussed, but the evidence is entirely inconclusive. The first white explorer of whom there is satisfactory record was the Chevalier de la Verendrye, a French-Canadian fur-trader who had settled on Lake Nepigon in 1728, and who, with a view toward developing commerce with the natives, passed 11 years of travel in the western wilderness.

He passed through Wyoming in 1743-4, on his return journey. According to the most authentic accounts, the first American to enter Wyoming was John Colter, who in 1807 discovered the Yellowstone region. The Wyoming section soon thereafter became the scene of the activities of American fur trappers and traders,—among them Capt. B. L. E. Bonneville, 7th U. S. infantry, whose adventures have been narrated in a well-known work by Washington Irving. The territory comprised within the present State belonged (with the exception of the southwestern corner—a portion of the territory ceded in 1848 by Mexico) to the Louisiana Purchase (1803). The first white settlement was at Fort Laramie, on the Laramie fork of the Platte, in 1834. This fort was purchased by the American Fur Company in 1835, rebuilt by the company in 1836, and sold by it to the United States government in 1849. For many years it was an important base of operations against the Indians. Fort Bridger was built on the Black fork of Green River in 1842, but abandoned in 1853. In 1842 Frémont visited Wyoming. Prior to 1866, all armed or migratory expeditions westward, including Gen. Connor's march along the "Bozeman trail" in 1865, had been in support of Mormon emigration, or to reach California and other opening fields of gold discovery. The inception of the Union Pacific Railroad developed new necessities for the occupation of regions farther north, only to be reached by the uncertain navigation of the upper Missouri. Gold discoveries in central Montana evolved the practical fact that neither river navigation, nor the diversion of overland travel from Ogden northward, at a sharp right angle, could furnish the required facility for reaching the new field of promise, but that a new road, following the Bozeman trail, around the Big Horn Mountains and up the Yellowstone Valley, would constitute a diagonal course which would shorten wagon travel by at least 300 miles. During the year 1865, the Harney-Sanborn treaty guaranteed to Indians occupying that vast hunting region their undisturbed possession, provided they would not interrupt the building of the proposed railroad across the plains. All that upper region once belonged to the friendly Crow Indians, known as "Upsero-kas," or "Absarakas," belonging to "the land the crows fly over," or the "Land of the Crows," and this included the region watered by the Yellowstone, Big Horn, and Big Wind rivers. Northern Sioux, Arapahoes, and Cheyennes had gradually encroached upon these hunting grounds, and were hostile to white intrusion as well as to the Crow Indians themselves. These tribes, however, were summoned to meet a government commission at Laramie in May 1866, to decide upon what terms they would permit the building of a wagon road through that country and around the Big Horn Mountains to Montana. This proposition gained new promise from the fact that during the winter and early spring of 1865-6 hostilities along the lower Platte had almost ceased, and the Pawnees of Nebraska and Spotted Tail's Brulé Sioux were friendly to the whites.

In anticipation of successful negotiations, without conflict, Maj.-Gen. John Pope, commanding the Department of the Missouri, by general order 33, reorganized the department, upon the muster-out of volunteers who served

WYOMING VALLEY—WYTHE

science and tactics is also given. The University has organized a University Extension Association, which conducts extension lectures in all parts of the State; a Correspondence Teaching Department is also conducted, by which some of the work toward a degree may be done. The campus now occupied 40 acres in the eastern part of the city; the buildings are the Hall of Languages, the Mechanical Building, the Hall of Science, and the Gymnasium; the three first mentioned are built of gray sandstone, which is found near Laramie. The library in 1903 contained 16,000 volumes; the students numbered 191, of whom 21 were in the College of Liberal Arts, 50 in the Normal School, 47 in the School of Commerce, 16 in the College of Engineering, 15 in the School of Mines, 4 in the Graduate School, and 39 in the Preparatory Department.

The University of Wyoming, though in numbers one of the smallest of the State universities, is well equipped and maintains a high standard of scholarship, as the real head of the educational system of the State.

Wyoming Valley, a crescent-shaped valley in Luzerne County, Pa., traversed by the northern branch of the Susquehanna River; length 21 miles. It is a fertile alluvial plain, with rich deposits of anthracite coal, and is noted for its beautiful scenery. The valley was claimed by the colony of Connecticut as early as 1753, and was first settled by people from Connecticut; the ensuing dispute between Pennsylvania and Connecticut over this territory is known as the "Pennamite and Yankee war," and was not finally settled till after the Revolutionary War. (See PENNSYLVANIA; *History*; *Boundary Disputes*.) In 1782 a commission appointed by Congress decided in favor of Pennsylvania; an attempt was made to drive out the Connecticut settlers which led to a renewal of the war; but in 1788 Pennsylvania confirmed the titles of all actual settlers to their land, and all controversy was ended by 1800. During the Revolutionary War, a large proportion of the men of the Wyoming Valley joined the Continental Army; but a number of Tories were living in the valley; and in 1778, when they were joined by British troops and Indian allies, an attack was made upon the settlers who had taken refuge in Forty Fort near Wilkesbarre. The settlers did not number over 400, chiefly boys and old men; the British force, including the 700 Indians, was about 1,100. After a desperate battle fought on the 3d of July 1778, the settlers were completely defeated, about two thirds being killed. They were forced to capitulate, and after the surrender many of the prisoners were tortured and killed by the Indians. The greater part of the inhabitants of the valley were compelled to flee to other settlements, and endured great hardships. Consult Miner, 'History of Wyoming' (1845); Stone, 'Poetry and History of Wyoming' (1844); Peck, 'Wyoming: its History and Incidents' (1858).

Wyon, wí'ón, **William**, English engraver and designer of coins and medals: b. Birmingham 1795; d. Brighton, Sussex, 29 Oct. 1851. Having won several prizes for medals offered by the society of arts, he went in 1816 to London, and was appointed second engraver at the mint, a post which he filled until the close of his life. In 1832 he was elected an associate of the Royal Academy, and in 1838 an academician,

being the first of his department who had ever obtained these honors. His works, comprising coins, pattern pieces of coins not used, medals, and seals, are numerous. His coins cover a period of nearly 30 years, including the latter part of the reign of George IV., the reign of William IV., and the first 13 years of the reign of Victoria. Far more numerous than these are his war, scientific, artistic, and testimonial medals, executed from his own or from Flaxman's designs, and in the highest style of art.

Wyss, vís, **Johann Rudolf**, Swiss author: b. Bern 13 March 1781; d. there 31 March 1830. He was educated at various German universities, became professor of philosophy at Bern in 1806, and later also chief librarian. His 'Der Schweizerische Robinson' (1812-13), an imitation of Defoe, was translated into various languages, the first series appearing in English ('The Swiss Family Robinson') in 1820, the second in 1849. Wyss also wrote 'Vorlesungen über das Hochste Gut' (1811), and 'Idyllen und Erzählungen aus der Schweiz' (1815-22); and edited the collection 'Alpenrose' (1811-30).

Wythe, wíth, **George**, American patriot: b. 1726 in the county of Elizabeth City, Va., a short distance from Yorktown; d. Richmond, Va., 1806. One of his ancestors was George Keith (1639-1716), a Scotch Quaker, distinguished as a mathematician and Oriental scholar, who emigrated to America about 1684. On account of his radical religious views and his opposition to slavery, he was often imprisoned. On 15 Oct. 1693, Keith issued an "Exhortation and Caution against buying or keeping Negroes," seemingly the earliest Quaker protest against slavery. These views were inherited by George Wythe. From his mother, Wythe received a life-long bent toward classical scholarship. Even at the age of 80, he began to learn a new language. He was trained in the law by an uncle. Wythe's connection with the House of Burgesses, in Virginia, began on 27 Feb. 1752, on the eve of the French and Indian war. Hence he knew in a practical way the steps leading up to the Revolution, whose course he was destined to influence. He was a member of the Continental Congress, and one of the signers of the Declaration of Independence. He sat in the Philadelphia Convention of 1787 and exerted himself to secure the ratification of the Constitution by Virginia the following year. For ten years he was a member of Virginia's supreme court of appeals, and for above 20 years sole chancellor of the State. However important and varied were such positions that he filled, George Wythe is not to be judged chiefly as statesman or jurist. He was greatest as teacher, and his most lasting work was the subtle influence of his singularly pure and lofty character. Either in his law office or as professor in William and Mary College, he was the teacher of Thomas Jefferson, John Marshall, James Monroe, Henry Clay, and scores of other men only less prominent than these. With Jefferson, in particular, Wythe maintained a friendship and interchange of thought which had a bearing upon national concerns. So highly did Jefferson prize the work of Wythe as a teacher, that he exerted himself to establish, in 1779, in the College of William and Mary a chair of law, expressly for the occupancy of his "master

1. Mechanical Building and Science Hall University of Wyoming.
2. Hall of Languages, University of Wyoming

WYTHEVILLE

and friend," as he delighted to call Wythe. Wythe was the first professor of law in the United States. William and Mary College was the second in the English-speaking world to have a chair of Municipal Law, George Wythe coming to such a professorship a few years after Sir William Blackstone. Jefferson, in writing from Paris in 1785 to Dr. Richard Price, an English opponent of slavery, gives striking evidence of his estimate of the services which Wythe was rendering to his country: "The College of William and Mary in Williamsburg, since the remodelling of its plan, is the place where are collected together all the young men (of Virginia) under preparation for public life. They are under the direction (most of them) of a Mr. Wythe, one of the most virtuous of characters, and whose sentiments on the subject of slavery are unequivocal." Henry Clay, in a letter of 3 May 1851, to B. B. Minor, says in reference to Wythe: "To no man was I more indebted, by his instructions, his advice, and his example, for the little intellectual improvement which I made, up to the period when, in my twenty-first year, I finally left the city of Richmond." "The most remarkable instance," says Munford, "of his genuine patriotism, to which I confess I am rendered most partial perhaps by my own experience of its effects, was his zeal for the education of youth. Harassed as he was with business; enveloped with perplexing papers, and intricate facts in chancery, he yet found time for many years to keep a private school for the instruction of a few young men at a time, always with very little, and often demanding no compensation." That Wythe conceived the training of publicists to be his true task appears from this sentence in a letter on 5 Dec. 1785, to John Adams: "A letter will meet me in Williamsburg, where I have again settled, assisting, as professor of law and police in the University there, to form such characters as may be fit to succeed those which have been ornamental and useful in the national councils of America." In three signal instances Wythe was a forerunner. As early as 1764, he wrote Virginia's first remonstrance to the House of Commons against the Stamp Act, taking so advanced a position in regard to that ominous Act as to alarm his fellow-burgesses. He was perhaps the first judge to lay down, in 1782, the cardinal principle that a court can annul a statute deemed repugnant to the Constitution, thus anticipating by a score of years the classic decision of his great pupil, John Marshall, in the case of *Marbury v. Madison*. He was an ardent advocate for the emancipation of the slaves, not only infusing his students with his abolition sentiment, but actually freeing his own slaves and making provision for them in his will. His death occurred in Richmond, Va., in 1806, from poison administered by his great-nephew, who hoped to come thus into the inheritance of his estate. "No man," says Jefferson, "ever left behind him a character more venerated than George Wythe. His virtue was of the purest kind; his integrity inflexible, and his justice exact; of warm patriotism, and devoted as he was to liberty and the natural and equal rights of men, he might truly be called the Cato of his country, without the avarice of the Roman; for a more disinterested person never lived. Temperance and regularity in all his

habits gave him general good health, and his unaffected modesty and suavity of manners endeared him to every one. He was of easy elocution, his language chaste, methodical in the arrangement of his matter, learned and logical in the use of it, and of great urbanity in debate. Not quick of apprehension, but with a little time profound in penetration, and sound in conclusion. His stature was of middle size, well formed and proportioned, and the features of his face manly, comely, and engaging. Such was George Wythe, the honor of his own and the model of future times."

S. C. MITCHELL,

Professor of History, Richmond College.

Wytheville, with'vil, Va., town, county-seat of Wythe County; on the Norfolk & Western Railroad; 130 miles west of Lynchburg and 215 miles southwest of Richmond. It is in a stock-raising and mining region and has considerable lumbering interests. It has manufacturing of iron works, woolen goods, and lumber products. The town has a county court-house, Trinity Hall Female College (Luth.), Wytheville Seminary (P.E.), Academy of the Visitation (R.C.), public elementary schools, and two libraries. The two state banks have a combined capital of \$100,000. Pop. (1890) 2,570; (1900) 3,003.

Wytheville, Military Operations at.

During the Civil War the lead mines and works near Wytheville assumed much importance. On 13 July 1863 Col. John T. Toland, with the 2d West Virginia cavalry and 34th Ohio mounted infantry, about 800 men, started from Fayetteville, W. Va., to damage the lead works and destroy the railroad near Wytheville. On the evening of the 18th Toland arrived within five miles of the town and detaching two companies to destroy a railroad depot and track, 10 miles west, marched his remaining force into the town, which was defended by less than 200 men, under Maj. Bowyer, most of them distributed in houses and some in the streets supporting two guns. There was an obstinate fight in the streets, lasting an hour, when the town was taken and 8 or 10 of the best houses burned. The two guns and many small arms were captured and some prisoners taken, but all were abandoned when the return march was taken up next morning. The command reached Fayetteville on the 23d after a march of about 300 miles. The expedition had failed of its object, with the loss of 78 killed, wounded, and missing, of whom 17 were killed, including Col. Toland and two other officers. Col. Powell, commanding the 2d West Virginia cavalry, was severely wounded and captured. The Confederates report a loss of 6 killed and 12 wounded. On 2 May 1864 Gen. Crook started from Charleston on the Kanawha to destroy the Virginia and Tennessee Railroad and join Gen. Sigel in the Shenandoah Valley. One of his columns, of 2,600 cavalry, under Gen. Averell, was directed upon Saltville to destroy the salt-works, and then rejoin the main column under Crook at Dublin Station. After a very difficult march through the mountains and some sharp skirmishing Averell reached Tazewell Court House on the afternoon of the 8th, where he learned that Saltville was defended by earth-works and artillery, and was held in strength by Gen. W. E. Jones, upon which he abandoned

WYTTEBACH

the idea of attack and turned toward Wytheville, near which he arrived on the afternoon of the 10th and encountered Col. John H. Morgan, who had followed him from Saltville and by a detour first gained the town with a brigade and two battalions. A detachment of Morgan's command had been pushed out to a small gap in the mountain, through which alone Averell could approach the town from the road on which he was marching. The detachment was immediately attacked and Morgan marched to its assistance with all his command, and Averell fell back to a commanding ridge 800 yards from the gap. The contest continued four hours, or until nightfall, in a succession of attacks on the one side and retreats on the other, when Morgan fell back a short distance and Averell withdrew and next morning marched for Dublin, where he arrived in the evening and, resuming his march, joined Crook at Union on the 15th. Averell had 114 killed and wounded, and lost nearly 100 in prisoners. Morgan had 50 or 60 killed and wounded. When Gen. Stoneman made his raid into southwestern Virginia in December 1864 he captured Wytheville on the 16th, partially burned it, and next day sent a detachment to destroy the lead mines, which was done without loss. On Stoneman's second raid in southwest Virginia and western North Carolina in March 1865, Col. J. K. Miller, with 500 picked men of his cavalry brigade, captured Wytheville 6 April and destroyed the

depot of supplies at that point and the bridges over Reedy Creek and at Max Meadows. At Wytheville Miller was attacked by Confederate infantry and cavalry, but after hard fighting repulsed them, and withdrew with a loss of 35 killed, wounded, and missing, and rejoined the main column on its march for Salisbury, N. C.
E. A. CARMAN.

Wytenbach, vīt'tēn-baŋ, **Daniel**, Dutch scholar: b. Bern, Switzerland, 7 Aug. 1746; d. Osgeest, Holland, 17 Jan. 1820. He studied at Marburg, Göttingen, and Leyden; became professor of Greek at the Remonstrant Gymnasium at Amsterdam in 1771, of philosophy at the Athenæum in 1779, and succeeded in 1799 to Ruhnken's chair of rhetoric at Leyden. His greatest work is the edition of Plutarch's 'Moral,' with copious annotations and an admirable 'Greek Index to Plutarch's Works' (1795-1830). He retired in 1816, and died after some years of blindness. His 'Opuscula' appeared in 1820. Consult Mahne, 'Via D. Wytenbach' (1823).

Wytenbach, Johanna Gallien, Dutch writer: d. Leyden. She was married to D. Wytenbach (q.v.) when he was 72, and after her husband's death lived at Paris and was given the degree of doctor in philosophy by Marburg, in 1827. Among her writings were: 'Theagenes' (1815); 'Leontes' Banquet' (1812); and the romance 'Alexis' (1823).

X

X the twenty-fourth letter and nineteenth consonant of the English alphabet: it is a superfluous letter since it stands for no sound that cannot be signified by other letters.

When it occurs in the beginning of a word it is always pronounced in English as *x*: *Xenophon*, *zenophon*, *xiphoid*, *ziphoid*; in the middle of a word it is usually equal to *ks*: *axis*, *aksis*, *Saxon*, *sakson*; but when in a word it ends a syllable, more especially an initial syllable, if the syllable following it is open or accented, the *x* has often the value of *gs*, as in *luxury*, *lugzury*, *exhaust*, *egzhaust*. Final *x* is always equal to *ks*. As an initial letter *x* does not occur in English save in words mostly technical and derived from Greek, and in a few words, mostly proper names, of Spanish origin. —The power of *x* in English, as in Latin, is that of the Greek letter *xi* (Ξ, ξ), but its form is that appropriated in the Greek alphabet to the guttural aspirate *chi* (Χ, χ). Before the introduction of *x* (ξ) the Greeks represented the sound of *x* by ΞΞ, χς, and the Latins at first did the like, writing *Maxsumus*, *proxsumus*; but as *x* had in their writing no function but that of representing, with *s* the sound of Greek *xi*, the very sight of the *x*, even before the eye came to the *s*, raised in the mind the idea of a sibilant, and thus rendered the sibilant letter itself superfluous, and before long it was omitted and *x*, standing alone, represented the two characters *x* and *s*. In the popular pronunciation of Latin in the later period of the empire, *x* seems to have been sounded like *s* or *ss*: some inscriptions of that period have *visit* for *visit* and *miles* for *miles*: this change in the sound-value of *x* has persisted in the modern language of Italy in which *ss* or *s* is regularly substituted for the Latin *x*: *saxum* becomes *sasso*, *experimentum*, *esperimento*, *maximus*, *massimo*, and so on. And in French, in words derived from Latin, the *x* occurring in the middle of a word is often changed to *ss*: *laxare* becomes *laisser*; or Latin *x* is changed to the sound of *sh*: *vexare* becomes *facher*; and the word *soixante* is pronounced *soissante*. *X* hardly occurs in German words of native origin; its sound is usually represented in that language by *chs*, examples: *ochs* (ox), *wachs* (wax), *Sachse* (a Saxon).

X-Rays, or **Röntgen Rays**, a form of radiant energy originating in the highly-exhausted vacuum tubes of Crookes (see **VACUUM**), and resembling light in certain respects, though differing from it notably in many ways. The X-rays are propagated in straight lines, and are capable of affecting the sensitive plates that are employed in photography, so that

subsequent development will cause the affected portions to blacken, just as though the plate had been subjected to the action of light. The X-rays are practically invisible to the eye. They are capable, however, of exciting brilliant fluorescence in certain minerals, and their presence may, by this means, be made distinctly evident to the eye. The X-rays were discovered in 1895 by Professor Wilhelm Konrad Röntgen, of the University of Würzburg; the name being given by him to signify that the ultimate nature of the radiation was unknown, "X" being a letter that is commonly used in algebraic operations to represent an unknown quantity.

In the nearly-perfect vacuums employed by Crookes, the high-tension electrical discharge does not take place between the electrodes in the form of a spark, but, when the tension of the gas in the tube is sufficiently low, it assumes the form of a luminous streamer, proceeding across the tube from the negative electrode (or "cathode"), in a direction perpendicular to the surface of this electrode. The luminous shaft that proceeds outward from the cathode in this manner is called the "cathode ray," and it exhibits many interesting phenomena. (See **VACUUM**.) In a general way, it may be said to deport itself as though it were composed of a storm of tiny electrified projectiles, which are negatively charged by contact with the cathode, and are then violently repelled from the cathode in a direction perpendicular to its surface. Many experimenters have devoted their attention to the cathode ray, in the endeavor to discover its true nature; and among these experimenters was Lenard, a young German physicist, who was assistant to Dr. Heinrich Hertz, at Bonn, at the time of the latter's death in 1894. Lenard appears to have been impressed with the idea that it is possible to make the cathode ray emerge from the vacuum tube, into the air. It would seem that the projectile explanation offered above precludes any such possibility; but Lenard found that if the vacuum tube is provided with a very thin pane of aluminum foil at the place where the cathode ray strikes it, this ray can apparently pass through the aluminum so as to emerge into the air outside of the tube. In Lenard's apparatus the vacuum tube is entirely enclosed by opaque material, so that the light from the interior of the tube may not affect the eye; the thin pane of aluminum being placed, as indicated above, at the place where the cathode ray within the tube strikes the wall of the tube. When the proper precautions are taken against the escape of any ordinary light from the interior of the tube, the cathode ray, in a darkened room, can be seen to emerge from the tube through the

X-RAYS

aluminum, taking the form of a divergent and diffuse luminous brush, which, as Lenard showed, can be deflected by a magnet. Lenard also found that the emerging brush affects a photographic plate, and he investigated the relative transparencies (or opacities) of various substances for it. Röntgen repeated certain of the experiments of Crookes, Hittorff, Lenard, and others, and made the further discovery that vacuum tubes also generate another kind of radiant energy, which he called "X-rays," and which resemble the cathode ray in some respects, but differ from it in not being deflected by a magnet, and in not being distinctly visible to the eye. The X-rays and the cathode ray are both capable of exciting strong fluorescence in certain crystalline substances which are subjected to their influence; and in working with the X-rays it is customary to make use of fluorescent screens, which are coated with barium platinocyanide, or with calcium tungstate, or with some other substance in which the fluorescent effects of the X-rays are very pronounced. A screen of this kind, when exposed to the action of the X-rays, becomes luminous, and the intensity of the luminosity is proportional to the intensity of the radiation striking the screen. Thus when a screen of this kind is glowing with uniform brilliance, and an object (such as a piece of lead or glass) which is more or less opaque to the rays is interposed between the screen and the tube from which the X-rays proceed, the object so interposed shields the screen, over a certain area, from the exciting X-rays, so that a comparatively dark region is produced, as though the opaque object were casting a shadow. The relative opacities of various substances can be studied in this manner, by merely interposing the objects whose opacities are to be tested, and noting the depths of the apparent shadows that are produced. Glass is found to be much less transparent to the X-rays than an equal thickness of aluminum or of wood, and, in general, it may be said that the opacity of any substance is approximately proportional to the density of the substance. When a portion of the human body is interposed between the tube and the fluorescent screen, the bones, having a greater density than the flesh that surrounds them, cast shadows upon the screen, so that their images can be seen, dark, against a much lighter background. In comparatively thin parts of the anatomy, such as the hand, very good shadowgraphs can thus be had of the bones; but when the X-rays have to traverse thicker parts of the body, such as the chest, the shadowgraphs are far less distinct. The ribs can be seen through the entire body, though somewhat imperfectly, and the liver and heart can also be indistinctly perceived. Tumors and other morbid growths can likewise be traced to some extent, as well as tubercular areas in the lungs, and certain other pathological conditions. (The haziness of the images that are obtained when the X-rays traverse thick tissues is due, no doubt, to "secondary radiation," as explained below.) Owing to the great density of lead, bullets that are embedded in the flesh can frequently be located with considerable accuracy, and in the surgical treatment of bullet wounds the X-rays are therefore often highly useful.

Permanent images of the shadowgraphs that are produced by the X-rays can easily be had by substituting a sensitive photographic plate for

the fluorescent screen referred to above; the image being allowed to fall upon the photographic plate, which is afterwards developed in the usual manner.

There has been some controversy about the origin of the X-rays;—that is, about the part of the tube from which they emanate. Röntgen believed that they originate in the region where the cathode ray is stopped by the wall of the tube, or by some other obstacle; and although this view has been disputed by other experimenters, it is now believed to be correct. That is, when the cathode ray strikes against the glass wall of the containing tube, the X-rays appear to originate at this point on the wall; and when the tube is so constructed that the cathode ray strikes directly against the anode, then the X-rays proceed from the anode. It has been found, indeed, that the radiation is much more intense when the design of the tube is such as to cause the cathode ray to impinge directly upon the anode, and in most of the modern tubes for the production of X-rays this construction is adopted. It is observed that when an X-ray tube has been operated for a considerable time, the vacuum within it becomes more and more perfect, so that it is eventually difficult to force through the tube a discharge sufficient to generate the rays with the desired intensity. Moreover, the penetrative character of the X-rays given off by a tube appears to depend to a considerable extent upon the degree of perfection of the vacuum, as was observed by Röntgen himself. For these reasons, most of the X-ray tubes are made, at the present time, with regulable vacuums, the main tube being provided with a side bulb, with which it communicates by means of a tube. The glass walls of the auxiliary bulb become covered with a thin layer of condensed air (see ADSORPTION); and when, through the operation of the apparatus, the vacuum in the main tube has become so highly perfected that the discharge passes with difficulty, the walls of the auxiliary bulb are warmed by a gas flame or otherwise, so that a portion of the air that is held condensed upon them is driven off into the interior of the bulb, and thence into the main tube, until the vacuum becomes reduced sufficiently to permit of the satisfactory passage of the discharge.

The experimental investigation of the X-rays is beset with serious difficulties, because these rays possess properties so different from those of ordinary light that few of the methods that are employed for the study of light can be applied to them. For example, the X-rays cannot be refracted, and they are apparently not capable of regular reflection. Hence they cannot be focused in any way. Furthermore, they cannot be made to exhibit diffraction, interference, or polarization. Many of the methods employed in the study of light are based upon one or more of these phenomena; and hence, the phenomena themselves being absent in the case of the X-rays, little or no help in the investigation of this form of radiation can be had from our previous experience with light.

When the X-rays traverse a solid which is more or less transparent to them, the distinctness of the shadow-like images that are seen upon the fluorescent screen, or which are recorded upon the photographic plate, diminishes with the thickness of the object through which the rays pass. The images become diffuse with

X-RAYS

increasing thickness in such a way as to suggest that the X-rays do not really travel in straight lines, but that they are capable of bending about an obstacle so as to influence the screen, or the sensitive plate, behind the obstacle. A more careful study of the phenomenon indicates, however, that the diffuseness of the image under these circumstances is due to the fact that each particle in the course of the X-rays acts as a centre of "secondary radiation," from which X-rays again emanate, though with reduced intensity, in all directions. The passage of X-rays through a body may therefore be compared with the passage of ordinary light through a light mist, each particle of the mist acting, in a similar manner, partly as a mere obstacle, and partly as a new centre of radiation, so that the shadows that are observed in such a case are diffuse and indefinite.

The discovery of the X-rays led to much speculation among physicists as to their ultimate physical nature. In the theory of light it was long ago pointed out that the disturbance which takes place in the ether when a light-wave travels through that medium must be such that the displacements that occur, whatever their nature may be, occur only in directions that are perpendicular to the direction in which the ray itself progresses. (See ETHER; UNDULATORY THEORY.) There appeared to be no phenomenon whose existence corresponded to the existence of a wave of compression and rarefaction in the ether, such as occurs in air when a sound-wave passes; and in order to explain the absence of this longitudinal wave of rarefaction and compression it was necessary, in the elastic-solid theory of light, to assume that the ether is absolutely incompressible, or to make certain other special assumptions with respect to its nature. Upon the discovery of the X-rays, it was therefore natural to inquire if they do not constitute the missing phenomenon corresponding to a compressive disturbance in the ether. This idea, although it was an attractive one, and agreed well with the absence of polarization in the X-rays, gradually fell out of favor, giving way temporarily to the hypothesis that the X-rays are similar in nature to ordinary light, but that they are of exceedingly short wave-length—much shorter, in fact, than any form of radiation previously known. There was much to be said in favor of this latter hypothesis, for it was known that the phenomena that would be manifested by light of wave-lengths exceedingly short in comparison with the average distances between the molecules of transparent bodies would be very different from those that are observed in connection with light of longer wave-lengths. Even if the wave-length of the X-rays were very short, however, it would be natural to expect that interference phenomena of some sort might still be observable; and yet no such phenomena could be detected. What is probably the true explanation of the nature of the X-rays was given almost simultaneously by Stokes, Lehmann, and J. J. Thomson. The "pulsation theory" advanced by these physicists assumes that the X-rays do not, like light, consist of *trains of waves*, in which a series of similar waves follow one another in rapid succession and at regular intervals, but that they consist, instead, of a series of electrical pulsations through the ether, following one another without any regularity. A mathematical analysis of the conse-

quences of this theory indicates that it is in entire harmony with the observed absence of refraction, reflection, polarization, interference, and diffraction. The cathode ray within the vacuum tube is believed to consist of a storm of tiny molecular fragments, or electrons (q.v.), the velocities of which may be as great as 40,000 miles per second. When one of these charged particles comes in contact with a solid wall or other obstacle, the abrupt change that is produced in its motion causes a violent alteration in the electrical stress that exists in the ether immediately about the point of collision, and the result is, that this point of collision serves as a centre from which a pulsation of electrical disturbance radiates outward. A fresh pulsation will therefore be produced every time a charged electron collides with the solid obstacle, and hence, since there is no regularity in the collisions, there will also be no regularity in the resulting ethereal pulsations. This view of the nature of the X-rays accords with all the known phenomena, even with the demonstrated absence of the X-rays from ordinary sunlight. This last fact was tested and verified by experiments upon Pike's Peak where a sensitive photographic plate was exposed for several months to the action of the sunlight, protected by wrappings that were impervious to light, but which would transmit, freely, any X-rays that might happen to be present. The elevated position was selected in order that any absorptive action that the earth's atmosphere might exert upon the rays should be reduced to the smallest practicable amount. Subsequent development of the exposed plate showed no evidence of the action of X-rays upon it.

In the course of experiments with the X-rays, it was soon found that they are capable of producing more or less marked physiological effects. The most noticeable of these consists in the "burning" of the skin, the cuticle becoming reddened and inflamed under protracted exposure to these rays, much as it does upon exposure to strong sunlight. It was also found that the human eye can perceive the X-rays faintly, though it is believed that the retina is not directly affected by them; the sensation of a faint, indefinite light to which they give rise being probably due to the fluorescing of some of the inner parts of the eye under their influence. The known fact that the artificial culture of tuberculosis germs must be conducted in the dark, and that strong sunlight will check the development of such germs, or destroy them altogether, led to the hope that the X-rays might have similar properties, and that on account of their marked power of penetrating the human flesh, they might be useful in the treatment of tuberculous disease. These hopes were not very fully rewarded, but the X-rays have nevertheless proved valuable in the treatment of superficial tuberculosis (lupus) and cancer. Some authorities still hold that the cases of apparent cancer which have been successfully treated by the X-rays have not been correctly diagnosed, and that true carcinoma does not yield permanently to the action of this agency. See ETHER; ELECTRON; LIGHT; RADIOACTIVITY; VACUUM. Consult, also, Barker, 'Röntgen Rays,' in the 'Scientific Memoir Series,' where several of the most important of the papers that have appeared are collected.

X. Y. Z. CORRESPONDENCE — XANTHOXYLUM

X. Y. Z. Correspondence, in United States history, the name given to the despatches of the three commissioners to France in 1797-8, Marshall, Pinckney, and Gerry. These commissioners reached Paris in October 1797, but were refused recognition by the Directory. They were, however, notified by the secretary of the Marquis de Talleyrand, minister for foreign affairs, that agents would be sent to conclude negotiations. The first of these, Hottinguer, stated that a "loan" of \$1,200,000 would be the necessary means of placating the Directory: the other two, Bellamy and Hauteval, urged that in case the American government would buy at par stock amounting to 32,000,000 livres, but whose market-value was really about one half that amount, the transaction would be viewed as a loan. The intimation was that in default of money war would ensue. These terms were promptly rejected. The despatches sent by the commissioners were submitted in copy to Congress, X., Y., and Z., having been substituted for the respective names of the French agents. A great stir was caused at the time. Preparations for hostilities were made, and war on the sea actually broke out. Consult for the text of the correspondence 'American State Papers, Foreign Relations,' Vol. II. (1832).

Xanthian (zăn'thî-an) **Marbles**, a large collection of marbles of various ages (from 545 B.C. onward) discovered near Xanthus, in 1838.

Xanthine, an organic base, $C_8H_8N_4O_2$, occurring in small amounts in many animal secretions, in the blood, urine, liver, in some urinary calculi, and in tea extract. It may be readily made by the action of nitrous acid on guanine. A white amorphous powder slightly soluble in water, and forming crystalline compounds with both acids and bases. It is closely related to theobromine and caffeine, the alkaloids found in cocoa and coffee respectively. Caffeine may be considered as xanthine in which three hydrogen atoms have been replaced by three methyl (CH_3) groups.

Xanthippe, zăn-thîp'ê, the wife of Socrates, the Greek philosopher. Her shrewish temper has become proverbial, but many of the stories about her are probably false, for in ancient Athens gossip was cultivated to the perfection of a fine art, the point and not the truth of the story being the chief consideration. Xanthippe's natural inequalities of temper were heightened by the peculiarities of her spouse, especially his indifference to the commonplace duty laid on the head of the house to make both ends meet. The philosopher received her reproaches with such good-humored indifference that it is not surprising she sometimes resorted to other weapons beside her tongue; as on the occasion when she is said to have finished up a tirade by sousing the philosopher, though his remark, as he moved dripping from the scene, that when Xanthippe thundered she watered, must have shown her that here, too, she was powerless.

Xanthippus, zăn-thîp'ûs, Spartan general. He assisted the Carthaginians in the first Punic war and defeated the Romans under Regulus at Tunes (now Tunis) 255 B.C.

Xanthos, zăn'thòs, the mythical horse of the mythical hero, Achilles. It is related in the 'Iliad' that being chided by his master for

leaving Patrocles on the field of battle, the horse turned his head reproachfully, and told Achilles that he also would soon be numbered with the dead, not from any fault of his horse, but by the decree of inexorable destiny.

Xanthos of Lydia, Greek historian. He flourished about the 6th century B.C., and was contemporary with Herodotus. He wrote a work called 'Lydiaca,' a history of Lydia onward from heroic times, giving also a geographical description of the country. Only fragments of it have been preserved.

Xanthoxylum, a genus of the *Rutaceæ*, composed of erect or climbing shrubs, or trees, often with prickly branches. The leaves are compound, pinnate, sometimes reduced to three, or rarely, to one, leaflet, usually pellucid dotted. The flowers are small, in axillary or terminal panicles, and are from 3- to 5-merous. The fruits split in two, with one or two shining black seeds. *Xanthoxylum* is a large genus, found both in the Eastern and Western hemispheres, especially in their warmer parts. The species are so aromatic and pungent that in the countries where they exist they are popularly called peppers, specially *X. piperitum*, called Japan pepper, which is regarded as an antidote for poison. *X. rhetsa*, an Indian species, has small yellow flowers and small round berries, which, when unripe, taste like the skin of a fresh orange. Its fruit, and the seeds and bark of *X. alatum*, which grows near the base of the Himalayas, and those of *X. budrunga*, also Indian, are given as aromatic tonics in fever, diarrhoea, dysentery, and cholera. They are used as a condiment in India and as a fish-poison. The small branches are employed to make walking-sticks, and the twigs as tooth-brushes. The seeds of the latter are as fragrant as lemon peel; *X. clava* and *X. fraxincum* applied externally to the gums or taken internally, are powerful sudorifics and diaphoretics used in toothache, paralysis of the muscles of the mouth, and rheumatism. The root of *X. nitidum* is sudorific, emmenagogue, etc. The powdered bark of *X. hiemale* is given in Brazil in earache; and the capsules and seeds of *X. hastile* are employed in northern India to intoxicate fish. The West Indian species of *Xanthoxylum* are called yellow-wood, *X. caribaum* being differentiated as the prickly yellow-wood. It is a tree, 20 to 50 feet high, whose prickly young stems are made into walking-sticks. The wood is used for inlaying and for furniture. *X. cribsosum* is the satin-wood of Florida and the West Indies, which when first cut has the odor of the veritable satin-wood *X. fagara* (*Pterota*) is a small tree common in the same region, and tropical America, producing a hard, heavy, reddish-brown wood known as savin or iron-wood in the West Indies, or as the wild-lime. Still another species is *X. emarginatum*, a shrub with coriaceous foliage, exported under the name of rose-wood, but is called licca-tree or lignum-vorum at home. The commonest species of the northern United States, and the hardiest, is the *X. Americanum*, a shrub or small tree, with odd-pinnate leaves, and twigs which are generally prickly. The cymose flowers are axillary and sessile, without calyx, and they are greenish-white. The capsules are black and ellipsoidal. It is called prickly-ash or toothache-tree, because both Indians and country people used the

XANTHUS — XENOPHANES

hot, acrid bark of both this species and *X. clava-herculus*, which when chewed produces a stinging sensation, for aching teeth. The bark of both these species, and the capsules of the latter, are a powerful stimulant and tonic drug. The southern prickly ash is *X. clava-herculus*, the sea-ash, or pepper-wood, has its flowers in large terminal compound cymes, and its prickles are supported on corky cushions.

Xanthus, zăn'thūs, Asia Minor, (1) an ancient city, the capital of Lycia, on the Xanthus River; about eight miles above its mouth. Its ruins near modern Gunik were discovered in 1838, and have yielded a large collection of marbles, now in the British Museum. (2) The river now known as the Kedja Ak rises in Mount Taurus, and falls into the Mediterranean a little to the west of Patara.

Xaverian Brothers. See ORDERS, RELIGIOUS.

Xavier, zăv'î-ér, Sp. hă-vê-ăr', **Saint Francis.** See FRANCIS XAVIER, SAINT.

Xavier, Henry, American horticulturist: b. Lyons, France, 26 March 1826; d. Mount Vernon, N. Y., 19 June 1901. When quite young he came to this country and in 1853 settled at Mount Vernon. He imported into the United States nearly every known species of wine-producing grape vines, making many trips to Europe for this purpose, and bringing the vines from France, Spain, Italy, Germany, and Hungary.

Xavier, Jerome, Spanish Jesuit missionary: b. Navarre; d. Goa, India, 1617. He wrote both in Latin and in Persian, and among his principal works are: 'Treatise on the Mysteries of Christianity' (1600); 'Life of the Apostles'; 'History of Jesus Christ'; 'Directory of Kings for the Government of their Subjects.'

Xebec, zê'bêk, a small three-masted vessel, employed in the Mediterranean, distinguished from other European vessels by the great projection of the prow and stern beyond the cut-water and stern-post. In this respect it resembles the felucca, from which it differs only in having the fore-mast square-rigged. The xebec is constructed with a narrow floor for the sake of speed, and of a great breadth, so as to be able to carry a considerable force of sail without danger of overturning.

Xenia, zê'nî-a, Ohio, city, county-seat of Greene County; on the Shawnee Creek, and on the Pennsylvania, the St. Louis, the Cincinnati, Hamilton & Dayton, and the Pittsburg, Cincinnati, Hamilton & Dayton R.R.'s; 55 miles southwest of Columbus. It is in the Little Miami Valley, in the midst of a productive farming region. It is well laid out and has good macadamized streets and enough of slope to have surface drainage. The chief manufacturing establishments are two shoe factories, one powder works, one ice factory, flour mill, four twine factories, cigar factory, two machine shops, one automobile factory, brewery, one daily paper house. In 1900 (government census) Xenia had 106 manufacturing establishments, capitalized for \$1,819,614 and employing 1,105 wage-earners to whom were paid annually \$394,386. The total cost, annually, for raw material, rent, fuel, etc., was \$2,171,360; and the value of the finished products was \$3,122,797. The county court-house is in a park in the centre of the

city. Other prominent buildings are the municipal building, the Ohio Soldiers' and Sailors' Orphans Home, and several business blocks. Outside the city limits are the county infirmary and children's home.

The educational institutions are Xenia Theological Seminary (United Presbyterian), opened in 1794, three high schools; Central, established in 1856, East Main Street, for colored pupils, and the Ohio Soldiers' and Sailors' Home High School; public and parish schools, a public library (building presented by Andrew Carnegie), and school libraries. Wilberforce University, in Wilberforce suburb, is for colored pupils. It has departments of law, theology, science, and literature, and a training school for nurses. There are 16 churches: Five Baptist, three Methodist, three Presbyterian, and one each of Roman Catholic, Disciples of Christ, Protestant Episcopal, Lutheran, and Reformed. The two banks have a combined capital of \$200,000, and total resources about \$1,300,000. The government is vested in a mayor, boards of public service and safety, and a council of seven members, elected biennially.

Xenia was settled in April 1803 by John Marshall. In 1808 it was incorporated. Pop. (1890) 7,301; (1900) 8,696; (1904 est.) 11,000.

J. P. CHEW,
Editor 'Xenia Gazette.'

Xenocles, zên'ô-klêz, Greek tragic poet: b. Athens 4th century B.C., in the time of Philip of Macedon. He obtained a prize for four plays, 'Œdipus,' 'Lycæon,' the 'Bacchantes,' and 'Athamas.'

Xenocrates, zê-nôk'ra-têz, Greek philosopher: b. Chalcedon 396 B.C.; d. 314 B.C. He was a pupil and friend of Plato, whose friendship he gained, and though of a dull and sluggish disposition, supplied the defects of nature by unwearied attention and industry. He succeeded Speusippus in the school of Plato about 339 B.C., presiding over the academy till his own death 25 years later. He was famed for his integrity and it is said that when he appeared in the court as a witness the judges dispensed with his oath. He was the author of numerous works, none of which, however, are extant.

Xenon, a gaseous chemical element discovered by Ramsey and Travers (1898) in the residue left after the evaporation of a large quantity of liquid air. Symbol X; atomic weight 128. It is an inert chemical element having a spectrum somewhat resembling argon.

Xenophanes, zê-nôf'a-nêz, Greek philosopher and poet; founder of the Eleatic school of philosophy: b. Colophon, Asia Minor, about 570 B.C.; d. about 480 B.C. He was a contemporary of Pythagoras and Anaximander, and having been banished from his native city went to Sicily, and thence to Magna Græcia. He settled, about 536 B.C., at Elcea (Velia), whence his system, and the school which he founded, derive their name. Of his poems, in which he treated of philosophical and other subjects, only fragments are preserved in the works of Athenæus, Plutarch, and others. The portions of his didactic poem, 'Peri physeos' (On Nature) have been collected by Brandis in his 'Commentationes Eleaticæ' (1813), and by Karsten in his 'Philosophorum Græcorum veterum reliquiæ' (Vol. I., 1830). He was an ardent monotheist and declared that Homer and Hesiod attributed

XENOPHON — XERES

actions to the gods that were disgraceful for men. Consult: Ueberweg, 'History of Philosophy,' English trans. (1872); Zeller, 'Philosophie der Griechen,' 4th ed. (1900). See ELEATICS.

Xenophon, zén'ō-fón, ancient Greek historian and general: b. Athens about 434 B.C.; d. Corinth about 355 B.C. He lived during a period in which the greatest political and intellectual excitement existed at Athens, and in which the most distinguished men, of whom he was one, appeared on the stage. Xenophon was a disciple of Socrates. He was said to have fought with his teacher in the Peloponnesian war, and to have had his life saved by Socrates in the battle of Delium (424 B.C.), but this is not now accepted. When the Persian prince, Cyrus the Younger, contended with his elder brother Artaxerxes Memnon for the throne, the Lacedæmonians sent him auxiliaries, among whom Xenophon served as a volunteer. Cyrus was defeated and lost his life on the field of Cunaxa (401 B.C.). The principal officers of the auxiliary army having been likewise killed in battle, or taken prisoners by artifice, and then put to death, Xenophon was apparently selected to command the Greek forces, 10,000 men strong. They were in a most critical situation, in the midst of a hostile country, without cavalry, surrounded by enemies and innumerable difficulties; but Xenophon was able to inspire them with confidence, to repress insubordination, and to lead them in their return march of 1,500 miles to the Black Sea. Xenophon himself has described this retreat, and at the same time the whole expedition of the younger Cyrus, in his 'Anabasis,' the most famous of military narratives. There is no means of verifying the statements of this work. On their arrival at Chrysopolis (opposite Byzantium) a number of the troops, with Xenophon at their head, entered the service of Scuthes, king of Thrace. Later, Xenophon joined the Spartan general Thimbron or Thibron, who was then conducting the war against the Persian satraps Pharnabazus and Tissaphernes. There is no reason to believe that Xenophon left Asia Minor before 394, when he returned to Greece with Agesilaus, king of Sparta, after his expedition against the Persians. In that year he fought on the side of the Spartans against the Athenians at Coroneia. As a consequence he was found guilty of high treason, and exiled. After that he settled at Scillus, a small town in the neighborhood of Olympia, in Elis. In this solitary retreat he dedicated his time to literary pursuits; and as he had acquired riches in his Asiatic expeditions, he began to adorn the country which surrounded Scillus. He built a magnificent temple to Artemis in imitation of that of Ephesus, and spent part of his time in rural employments, or in hunting in the woods and mountains. He does not appear ever to have returned to Athens, although the sentence of banishment passed on him was afterward repealed. He remained for about 20 years at Scillus, but was ultimately expelled from it (371 B.C.) by the Eleans. Thereupon he retired to Corinth, where he died. Besides the 'Anabasis,' Xenophon wrote the 'Apomnemonemata,' more commonly known as the 'Memorabilia Socratis,' in which there is no doubt that we have a faithful representation of one side of the Socratic teaching; the 'Cyropædia,' in which, under the guise of a life

of Cyrus the Elder, there is an exhibition of Xenophon's views respecting the best form and methods of government; the 'Symposium' (Banquet), in which Socrates is brought before us under his social aspect; and of several minor works on hunting, agriculture, politics, and the science of war. The style of Xenophon is in general a model of simplicity. The Greeks esteemed his merit as a writer so high that they called him the 'Attic bee' and the 'Attic muse.' Later criticism has found that in both vocabulary and syntax he frequently deviates from the best Attic usage. His works have been often published separately and together. Among the best editions of the complete works of Xenophon are those by Schneider and others (1791-1849), Sauppe (1865), and Dindorf (1875). There is a complete English translation by H. G. Dakyns, with introductions and notes (1890-3). Consult also the studies by Croiset (1873) and Roquette (1884).

Xenophon of Ephesus ("XENOPHON THE YOUNGER"), Greek writer who flourished in the 2d century A.D. One work of his has been preserved, a story in five books, called 'Ephesiaca; or The Loves of Abrocomas and Anthia.'

Xenos, zé'nós, **Stefanos Theodoros**, Greek author. From 1855 he was a merchant and general broker in London, and in 1858 was naturalized as a British citizen. He published: 'The Devil in Turkey' (1850), a three-volume English translation from the author's unpublished Greek manuscript; in Greek, 'The Heroine of the Greek Revolution' (1861), translated as 'Andronike' (1807); 'East and West: A Diplomatic History of the Annexation of the Ionian Islands to the Kingdom of Greece' (1865); and 'Depredations; or Overend, Gurney and Co. and the Greek and Oriental Steam Navigation Company' (1869).

Xenotime, a mineral occurring in crystals of the same forms as zircon. It is essentially an yttrium phosphate, YPO_4 , but much erbium is frequently present, and also sometimes the cerium metals, and small quantities of thorium and silicon. It is usually found in minute crystals of resinous or vitreous lustre, yellow or brown color, and having a hardness of 4 to 5 and specific gravity of about 4.5. It occurs as an accessory constituent in many granites (see Derby in Am. J. Sc. 41, 308, 1891), in large crystals in the granitic rocks of Norway, in the auriferous gravels of North Carolina and Georgia, and in choice crystals in the gneiss of New York city. When obtainable in sufficient quantities it will be an important ore of yttria and erbia.

Xeres, há'rās, **Francisco**, Spanish historian: b. Seville about 1500; date of death unknown. He accompanied Pizarro, as his secretary, to Peru, about 1530, and of that expedition wrote a detailed history, entitled 'A True Account of the Conquest of Peru' (1547). The work was translated into Italian by Ramusio, and into French by Ternaux-Compans and is still valued as a source of information.

Xeres, or **Jerez**, **de la Frontera**, Spain, a town in the province of Cadiz, on the Guadalete, 15 miles north-northeast of Cadiz, in a beautiful and fertile plain. Its manufactures are unimportant; but the trade, of which the staples are corn and wine, is very important. The wine is widely known as the popular sherry, and is

XEROPHYTES — XIMENES

largely exported. Near this town a battle was fought between the Moors and Goths in 711, in which Roderick, the last king of the Goths in Spain, lost his life. Pop. (1901) 60,846.

Xerophytes, zēr'ō-fits, plants which have guarded themselves by structural means against excessive transpiration. The term was originally applied to plants living in dry and sandy soil, or on rocks, and to those inhabiting deserts; but it is now extended to plants existing in localities where, for one reason or another, they can not readily obtain water, as in the case of beach plants and epiphytes, and have consequently adapted themselves to prevent the waste of the moisture which they have. This result is obtained in various ways. In some, the transpiring surface is greatly reduced, and the foliage is nearly or wholly dispensed with, the stems themselves taking its place, as in switch plants and cacti; and this habit is frequently combined with the storage of water in succulent tissues. Other plants, like the eucalyptus trees predominating in the dry forests of Australia, by a vertical arrangement of their foliage, or a similar disposition of the branches themselves, when foliage is wanting, as it is in the casuarinas, avoid presenting broad surfaces to the sun and hot winds. Some erophytic plants close their leaves just before the dry season; the whole existence of others begins and ends during the continuance of a rainy season; and in the bulbous and tuberous plants we see still another common arrangement for passing the dreaded dry months, the plants growing vigorously and completing their above-ground existence, while the weather is still favorable, and storing up food in their roots or rootstocks, so that they may rest uninjured in the ground during the heated term, and be ready to spring into activity as soon as the rains begin. An extensive development of ligneous tissue is characteristic of xerophytes, and so also are such modifications of tissue as the matted hairs, mineral, waxy and varnish-like encrustations on the epidermis, the closing or concealing of stomata, etc.

Xerxes I., zérk'sēz, king of Persia: b. about 519 B.C.; d. 465 B.C. He was the second son of Darius, the son of Hystaspes, and began to reign in 485. He was preferred to his brother Artabazanes, born before his father was raised to the throne; while Xerxes was born after that event, and was the son of Atossa, daughter of Cyrus, but this preference caused no struggle between the brothers. After having suppressed a revolt in Egypt in a single campaign, he thought himself able to execute the plan of conquering Greece, already conceived by his father, and collected for this purpose an immense army, estimated by the historians as containing 1,000,000 men. In all probability the Greeks greatly exaggerated the number of their enemies; and the train of women and slaves who followed the army made at least half of its numerical amount; still the numbers of the Persians were beyond all comparison superior to those of the Greeks. By means of a bridge of boats Xerxes crossed the Hellespont (480) while the Greeks awaited him on the frontier of their country, in the pass of Thermopylæ. After the heroic Leonidas had fallen with his Spartans (see LEONIDAS), Xerxes burned Athens, which had been forsaken by

its inhabitants. The first naval battle between the two powers at Artemisium had been indecisive; but it inspired the Greeks with new confidence; and the second naval action at Salamis, in which, if we believe the Greek historians, 2,000 Persian vessels were engaged against 380 Greek, terminated in the defeat of the Persians (Sept. 480). Xerxes now quitted Greece, leaving behind him his best general, Mardonius, who, not long after, was routed at Platæa. Xerxes now gave himself up to debauchery; his conduct offended his subjects and Artabanus, the captain of his guards, conspired against him, and murdered him in his bed. The personal accomplishments of Xerxes have been commended by ancient authors; and Herodotus observes that there was not one man among the millions of his army that was equal to the monarch in comeliness or stature, or as worthy to preside over a great and extensive empire.

Ximena, hē-mā'nā, in Spanish legendary history, the wife of the Cid (q.v.).

Ximena, or the Heroic Daughter, an English adaptation of Corneille's 'Cid,' by Colley Cibber, first played in London in 1712, and printed in 1718.

Ximenes, zī-mé'nēz, Sp. hē-mā'nās, **Francisco**, Spanish ecclesiastic and prime minister: b. Torrelaguna, Castile, 1436; d. Roa, near Valladolid, 8 Nov. 1517. He was graduated in civil and canon law at Salamanca in 1456, became a priest and going to Rome practised in the courts of the consistory 1459-65. He obtained a papal bull, which secured to him the first vacant benefice in Spain, but the archbishop of Toledo refused to give him any place, and, Ximenes having taken possession of a vacant benefice the archbishop caused him to be imprisoned. Ximenes, nevertheless, recovered his freedom, and the Cardinal Gonzalez Mendoza, bishop of Sigüenza, appointed him his grandvicar. He entered the Franciscan order in 1482, and for several years practised the most rigid asceticism. In 1492 he became confessor to Queen Isabella of Castile, to whose notice he had been recommended by Cardinal Mendoza, and in 1495 was made archbishop of Toledo. He did not accept this dignity till after many refusals, and an express command from the pope. As an archbishop he was very zealous, behaving as a father toward the poor, abolishing a multitude of abuses, and adhering steadfastly to his resolution that public offices should be filled with honorable and well-qualified men. In spite of all opposition he effected a reform in the mendicant orders of Spain, founded in 1499 a university at Alcalá de Henares, and undertook in 1502 the Complutensian Polyglot Bible. His activity was also displayed in other ways. Dissensions prevailed in the royal family. Philip of Austria, son of the Emperor Maximilian I., had married Joanna, the only daughter of Ferdinand and Isabella, and on the death of the latter Philip received Castile, in right of his wife, the sole heiress of her mother. This gave rise to disputes between him and his father-in-law, which were composed by Ximenez. After Philip's death (1506) Ferdinand became regent of Castile for his grandson, afterward the Emperor Charles V., who was a minor. On this occasion he had been much assisted by Ximenez, who in 1507 was made cardinal and grand-inquisitor of Spain. The conversion of the Moors

XIMENES DE QUESADA — XUARES

now particularly occupied his attention. With this view he formed the project of passing over to Africa, in order to take the fortress of Oran, and in May 1508, landed on the coast of Africa. A battle soon followed in the neighborhood of Oran, in which the Moors were defeated. The fortress was immediately taken and the garrison put to the sword. Ximenes caused Oran to be fortified anew, changed the mosques into churches, and returned as a conqueror to Spain. When Ferdinand died in 1516, his grandson Charles being still a minor, Ximenes became regent of Spain, during his regency of two years, brought the finances into order, paid the crown debts, and restored the domains which had been alienated, caused the laws to be observed, and placed the Spanish military force upon a respectable footing. Consult: Flécher, 'Histoire du Cardinal Ximenes' (1693); Hefele, 'Der Kardinal Ximenes' (1844, English trans. 1860); Barrett, 'Life of Cardinal Ximenes' (1813); Prescott, 'Ferdinand and Isabella' (1838); 'Life,' by Ulrich (1883).

Ximenes de Quesada, dā kā sā thā, Gonzalo, Spanish explorer and conqueror: b. Granada about 1498; d. Mariquita, New Granada, 16 Feb. 1579. He came to America in 1535 as a judicial functionary in the suite of Pedro Fernandez de Lugo, governor of the province of Santa Marta, who chose him to head an expedition against the Chibchas, supposed to number more than 2,000,000 souls, on the great plains of Tunja and Bogota, and the neighboring regions about the head-waters of the river Magdalena. He set out 6 April 1536 from Santa Marta, but at the end of eight months had made no more than 450 miles. After great hardships the expedition reached the mountains and in the following March progress was resumed.

The first Indians he met were so terrified by the sight of his horses that they instantly submitted. Approaching at Tunja the court of one of the great chiefs of the Chibchas, he was allowed to enter the palace, but was treacherously attacked as he was about to embrace the chief. The chief was taken, after much slaughter, and Ximenes became possessed of vast riches. From Tunja he marched upon Iraca, the sacred city of the nation. Here two Spanish soldiers, in pursuit of plunder, accidentally set fire to the great temple of the sun, which had been captured by Ximenes, and it perished with the city after burning several days. Returning toward Tunja, he fought a desperate battle at Borja against 12,000 natives, whom he defeated, after which he made treaties with several caciques, who voluntarily submitted. A usurping chief was then proclaimed king of Spain, but was required to deliver the treasures of his predecessor to the Spaniards. After a short imprisonment he promised within forty days to fill a room with gold and emeralds, but not keeping his promise, was put to death with cruel tortures. On 6 Aug. 1538 Ximenes founded the city of Santa Fé de Bogota.

He was presently joined by Benalcazar, the lieutenant of Pizarro, and Frederman, who presently conspired against Ximenes, but without much success. The three then returned to Europe to lay their claims before Charles V., but while Benalcazar was made governor of Popayan, Frederman and Ximenes gained nothing. Later, however, Ximenes was made marshal of New

Granada, and returning to Bogota in 1551, seems to have protected the people against the rapacity of Spanish officials. About 1561 he was named by the Spanish government *adelantado*, or governor-in-chief of the kingdom of New Granada, and induced to fit out an expedition in search of El Dorado, beyond the territories of Pauto and Papamene. To this enterprise he devoted three years, spending immense sums in fitting it out, but returning with only a handful of followers. In 1572 he founded the city of Santa Agueda, 21 miles from Mariquita. He died of leprosy, and by his will declared himself poor and forbade the erection of any but the simplest monument over his grave. His remains were removed to Bogota in 1597. He left a manuscript work entitled 'Sermones' and a 'Compendio historial,' both of which are lost. Consult J. Acosta, 'Historia del descubrimiento y colonizacion de la Nueva Granada' (1849); Antonio de Plaza, 'Memorias para la historia de la Nueva Granada' (Bogota 1850).

Ximénia, a genus of *Olacaceæ*, represented by large shrubs or small trees, often spinous. Leaves entire, leathery; calyx very small, petals four, hairy inside; stamens eight, ovary with four one-seeded cells. *X. americana*, the false sandalwood, is a straggling Indian shrub, or low spreading tree; producing dull-white fragrant flowers, smelling like cloves, succeeded by small, oval, red or yellow pulpy fruits, an inch long, aromatic, but somewhat astringent. They contain a white globose nut with a kernel which tastes like a filbert. Its wood is very tough and heavy. This shrub is known in Florida as the hog-plum or wild lime, and in the West Indies as mountain or seaside plum.

Xingú, shēn-goo', a river of Brazil, one of the chief tributaries of the Amazon. It is formed by the junction of several head-streams which rise near lat. 15° S., lon. 55° W. Chief of these is the Tamitatoaba, which flows from a small lake about 75 miles in circumference. After flowing north for 1,200 miles through a densely forested and little explored region, the Xingu forms a large lake which is connected with the Amazon estuary by a number of deltaic channels 240 miles west of Pará. Steamers ascend the river to the Cataract and Fall of Itamaracá. The river was unexplored until 1884-7, when it was descended from Cuyabá by Von den Steinen.

Xiphodontidæ, zī-ō-dōn'tī-dē, a family of primitive forerunners of the ruminants, whose remains occur in the Upper Eocene rocks of western Europe. Some of them are the largest and most slender artiodactyls of their age, and the only feet hitherto discovered are two-toed, with mere rudiments of the lateral digits. Compare OREODON.

Xiphosura. See HORSE-FOOT CRAB; ME-ROSTOMATA.

Xuares, hoo-ā-rās, Gaspar, Paraguayan botanist, historian, and biographer: b. Santiago del Estero, Paraguay, 17—; d. Rome, Italy, 1804. Entering the order of Jesuits, he devoted himself to teaching philosophy and theology; and after the suppression of his order he removed to Italy, where he occupied himself with botanical researches. He wrote: 'History of Buenos Ayres,' and 'Dissertations,' which remain in MS.; 'Life of St. Francis Xavier'; etc.

XULLA — XYLOPIA

Xulla, shoof'lā, or **Zorella, Islands**, East Indies, a group in the Molucca Sea, south of the Molucca Passage, and east of Celebes. The largest islands of the group are Taliabo, Mangola, and Xulla Besi. The first is about 40 miles long.

Xurel. See HORSE-MACKEREL; JUREL.

Xylander, ksi-län'dër, **Guilielmus**, German scholar: b. Augsburg 20 Aug. 1532; d. Heidelberg 10 Feb. 1576. His real name was Holzmänn. He was educated at Tübingen and Basel and in 1558 was appointed professor of Greek at Heidelberg. His numerous Latin translations from the Greek have been of much service to later students.

Xylene, in chemistry. Three isomeric hydrocarbons are known by this general name, orthoxylene, metaxylene, and paraxylene. They all have the composition $C_6H_4(CH_3)_2$ and are dimethyl derivatives of benzene. Commercial xylene or zylol, found in coal tar, is a mixture of the above three. It is a colorless, oily liquid, boiling above $140^\circ C.$, not soluble in water, and used as a solvent in various chemical operations.

Xylography. See WOOD ENGRAVING.

Xyloidin, in chemistry, an explosive probably of the composition $C_6H_5NO_2O_8$, known also as pyroxylam and nitrostarch. Discovered by Braconnet in 1833 and prepared by dissolving one part of potato starch in eight parts of fuming nitric acid and then pouring this solution, well cooled, into sixteen parts of concentrated sulphuric acid. It is a white hygroscopic powder, insoluble in water and alcohol, but

soluble in ether. It is not used to any considerable extent.

Xy'lophone, a musical instrument consisting of bars of wood or glass graduated in length and resting on belts. The notes are produced by striking on the bars with small hammers.

Xylo'pia, a genus of anonaceous trees or shrubs, natives of tropical regions, with coriaceous leaves, commonly two-ranked, and flowers in axillary clusters or solitary. The corollas have six petals, the outer three elongated, boat-shaped, curving over and partially enclosing the other three. The receptacle is conical, with the stamens outside and the carpels in its excavated interior. The fruits are elongated berries. *X. sericca*, the pindaiba of Rio Janeiro, bears a highly aromatic fruit, which may be used as pepper, with which it agrees in its flavor. Good cordage is made from the fibres of its bark. The wood, bark, and berries of *X. glabra*, the bitter wood of the West Indies, taste like orange seeds, and impart a similar flavor to the wild pigeons which feed on them. It is said to be useful in colic and for creating an appetite. Martius believes the fruit of *X. grandiflora* to constitute a valuable febrifuge used by the South American Indians. The dry, black, and quill-like fruits of *X. aromatica* form the *Piper athiopicum* of commerce, used as pepper by the West African negroes, as they are aromatic. They are sold in the native markets as a stimulant and condiment. *X. polycarpa* is the yellow dye-tree of tropical Africa, with a bitter bark, that contains berberine, and which yields a yellow dye, of extensive use; it is also employed for the treatment of bad ulcers.

Y

Y the twenty-fifth letter of the English alphabet, derived from the Greek through the Latin, is both vowel and consonant. It came into Latin in Cicero's time in spelling words borrowed from the Greek; for the

Latin language has no sound like that of the Greek **Υ** (upsilon); the *y* found in some Latin words, as *lacryma*, *satyra*, *sylva*, is due to an error of modern editors; those words were in ancient Latin always written *lacrima*, *satira*, *silva*. The modern Italian alphabet has no *y*, and the *y* of Greek words adapted into Italian is changed to *i*: *sinfonia*, *symphony*, *sindico*, *syndic*. In Dutch, *y* stands for *ij*, and represents the diphthongal long *i* of English as in *time*. In English, *y* is a superfluous letter, so far as it stands for a vowel sound; as such, it can always be represented by the vowel *i*. The sound of **Υ**, **υ**, in Greek, was that of French *u* and German *ü*. This sound does not exist in English: it is heard when, with lips and tongue in the positions for pronouncing the vowel sound *oo*, one tries to give the English vowel sound of *e* in *he*. In early English or Anglo-Saxon, *y* represented this peculiar vowel sound; but it has so far dropped out of English speech that a person whose only speech is English cannot pronounce it untaught. At the time of the Norman Conquest *i* had taken the place of this *y*, and soon both the sound and the letter went out of English use. But when Norman words came to be used by the English the French *u* sound was retained in many words, as *muse*, *lute*, *duke*, and they were pronounced with the French *u*; this sound gradually developed into *iu*, but the spelling remained unchanged: this *iu* represents the sound of *u* in *musc*, *duke* as now pronounced. In the beginning of syllables and when followed by a vowel, *y* is a palatal consonant, formed by bringing the middle of the tongue in contact with the palate, nearly in the position for *g* hard; hence Old-English *g* hard has often been softened into *y*, as in *day* from Old-English *dag*. Till comparatively recent times it was customary to write *the*, *y^e* and *that*, *y^t*, and those forms were repeated in typography. In those cases the character resembling *y* or identical with it, stood, not for **Υ** but for the Old-English letter **ƿ**: it is a mere ignorantism to read "y^e year," *ye year* as though *y* here stood for the consonant **Υ**, and not for the digraph *th*.

Yachts and Yachting. The term yacht is not easily defined, for it is now applied to vessels of widely different size and build, propelled either by means of sails or by steam, electricity, or other similar power, and used for many different purposes, such as racing, cruising, exploration, state ceremonial, etc. Sailing yachts

may be of any rig suited to their size, chiefly cutters, schooners, ketches, yawls, and luggers.

History.—The word *yacht* is of Dutch origin, being from the Dutch *jagt*, a swift vessel, from *jagen*, to chase, to hunt. It seems to have been introduced into England in 1660 when the Dutch presented Charles II. with a yacht. The first recorded yacht race was that between Charles II. and his brother, the Duke of York, which took place on the Thames in 1661, but from that date none is on record till 1796, when ten boats started on a 50-mile race in the Bristol Channel under the auspices of the Bristol Sailing Society. Yacht-racing is a characteristic development of the 19th century, especially of its latter half. For a long period, extending well into the 19th century, yachting was closely connected with naval defense, and private yachts were generally constructed to carry guns and be used in case of need for naval purposes. Private individuals of means were thus able to contribute to national defense not only directly by forming a kind of minor volunteer fleet, but also indirectly by leading the way in the development of naval architecture. In 1832 the *Emerald*, the fastest cutter in the Royal navy, was defeated in a racing and sailing contest with the *Paddy* from Cork, a yacht belonging to a member of the famous Water Club of Cork, and in consequence the head of the government school of naval architecture in Portsmouth was deputed to measure several private yachts with a view to improving the construction of vessels for the navy. In the following year the *Water Witch*, a vessel similar to the 10-gun brigs of the navy, built for Lord Belfast, proved herself faster than any vessel in the Royal navy, and better than any of her kind for purposes of warfare. Of the many yacht clubs now in existence only the Royal Cork Yacht Club and the Royal Thames Yacht Club can trace their history back to a period before the last century. The premier yacht club of Great Britain, the Royal Yacht Squadron, with headquarters at Cowes, dates back to 1815 in its formal capacity. In 1820 it became the Royal Yacht Club, and in 1833 its name was changed by royal order to Royal Yacht Squadron. The Royal Northern Yacht Club, with headquarters at Rothesay, was founded in 1824. The remaining clubs in Great Britain number altogether about 120, of which about one third are Royal.

American Clubs.—In the United States there are more than 200 yacht clubs scattered throughout the country, having about 4,000 yachts. But of these vessels only about 700 are above 40 feet in length, and only a little over half of these are propelled by steam. The New York Yacht Club, the oldest in the United States, having been organized in 1844, has a membership of over 1,000, but there are only about 140

YACHTS AND YACHTING

steam yachts and launches on its list. Thus the sailing yacht is the normal type of American pleasure craft. There are two distinct kinds of yacht, whether propelled by sail or steam—the racing yacht, in which comfort is sacrificed for speed, and the commodious, well-proportioned cruiser yacht; but even in the latter every modern discovery tending to increased speed is incorporated. Popular interest in yachts may be dated from the victory of the yacht *America* in the international contest around the Isle of Wight in 1851. She represented certain American ideas in the shape of her hull and the fit of her sail, which were immediately copied in England. From that day the history of sailing yachts has been a steady improvement in speed through the efforts of such yachtsmen as James Gordon Bennett, General Charles T. Paine, C. O. Iselin, J. Pierpont Morgan, and William K. Vanderbilt, and such designers as the late Edward Burgess, A. Cary Smith, J. Beaver Webb, and Nat G. Herreshoff. The last named was the author of both the latest international cup-racers, *Vigilant* and *Defender*. The same designers have won golden opinions for their work in the field of steam-yachting, as have also Gustav Hillmann, Lewis Nixon, C. D. Mosher, and Charles M. Seabury; and American yards can now turn out steel steam-yachts equal to the best made in England.

Racing Yachts.—The designing and construction of a racing yacht require no small amount of scientific and technical knowledge besides large experience, and consequently the yachts entered for the leading races, at least in the higher classes, are the work of a very few designers and builders. In a yacht intended for racing, speed is the primary essential, and to it accommodation and convenience are in large measure sacrificed. Moreover, a designer has to take into account the circumstances under which his vessel is to be run, or the competitors which she has to meet, because a yacht that does well in fine weather and a smooth sea will usually be of little account in boisterous weather and a rough sea. The rating rules of the Yacht Racing Association (formed in 1875) also condition the designer's work, and it will be necessary, therefore, to give some account of them here. The object of rating regulations is to secure that all competitors shall start on practically even terms in any given race, and this is achieved by the classification of yachts in well-defined groups according to certain measurements, and also, especially among large yachts, by means of time allowances corresponding to differences in these measurements. In the early days of racing, yachts were grouped according to tonnage, the tonnage being determined, as for other vessels at that time, by multiplying the length by the breadth and the depth and dividing by 96 (afterward 94). This was replaced by what is called builder's measurement or old measurement, which is still in use for some purposes connected with yachts. The formula for tonnage

$$(L - \frac{1}{8}B) \times B \times \frac{1}{4}B$$

according to this system is —

94

where *L* and *B* denote length and breadth respectively. The Thames measurement rule, introduced in 1854, made tonnage equal to $(L - B) \times B \times \frac{1}{4}B$

—; but in 1881 the Yacht

Racing Association introduced the 1730 rule, according to which the tonnage was equal to $(L \times B)^2 \times B$

— . These rules were found to

1730

have the effect of encouraging the construction of yachts of very narrow beam, especially after about 1871, when designers learned the use of outside ballast on the keel. A great change was effected in 1886, when the length-and-sail-area rule came into force, and yachts were classified according to rating determined by the formula

Length \times Sail Area in sq. ft.

6000

The present linear rating rule was adopted in 1896, but it cannot be said that finality has yet been reached. Linear rating is expressed in feet, and is determined by the formula

$$\text{Length} \times .75 \text{ Girth} \times .5\sqrt{\text{Sail Area}}$$

2

The relation of the classes under the 1881, 1886, and 1896 rules may be shown as follows: 18 feet linear rating = $\frac{1}{2}$ rating (length and sail area); 24 feet = 1 rating; 30 feet = $2\frac{1}{2}$ rating; 36 feet = 5 rating = 3 tons; 42 feet = 10 rating = 5 tons; 52 feet = 20 rating = 10 tons; 65 feet = 40 rating = 20 tons.

For the smaller vessels wood is the cheapest and lightest material, but larger ones are made of steel, or of steel frames with a wooden skin, the latter class being called composite. Other metals, notably aluminum, have also been used for the construction of yachts. Practically all large composite vessels, and also many small ones, have a copper sheathing to protect the submerged parts of the wood from the action of the water. The sails of racing yachts are generally made of cotton, mostly of the finest Egyptian variety; but ramie fibre is coming into use for this purpose, and a mixed cotton and ramie material is also in use. Up till a comparatively recent date flax was generally used for the sails of racing yachts, though it does not produce a sufficiently smooth and close-textured cloth.

Speed.—The speed of a racing yacht of given size may be regarded as the result of a compromise between stability, which determines sail-carrying power, and resistance. The stability depends upon well-known hydrodynamic principles, and may be roughly said to be determined by breadth of beam, the lowness of the centre of gravity of the vessel, and the quantity and position of the ballast. Resistance at low speeds is due chiefly to surface or skin friction, but at higher speeds it is principally caused by wave-making, a phenomenon too intricate to be discussed here. An increase in beam increases stability, but at the same time increases skin friction. Wave resistance is less in vessels whose displacement is obtained mainly by breadth than in those where displacement is principally determined by depth. Various means of lowering the centre of gravity have been adopted with advantage, such as the use of hollow masts and booms, the use of aluminum for the upper part of the vessel's sides, etc. Stone ballast was used in the early days of yachting, but it was superseded by iron, and that in turn by lead. The lead ballast was afterward carried on the keel, and, later, the keel consisted of a plate of

YACHTS AND YACHTING

lead projecting far below the hull. At present the deep fin-keel is of some other metal than lead, and carries the lead at its base in a cigar-shaped bulb. Surface friction is lessened by making the submerged surface smooth, either by coating it with varnish, or by covering it with polished metal, or in some similar way. The chief names in the evolution of the present shape or lines of yachts from the old "cod's head and mackerel's tail" varieties are those of Scott Russell and John Hyslop, the latter an American. The curve of cross sections for the fore part should be nearly a curve of versed sines, and that for the hinder part a trochoid; but various considerations may modify these theoretical forms. If two vessels differ in nothing but length, the longer will be the faster. The centre-board keel, consisting of a plate of iron which can be raised or lowered according to circumstances, was of British invention, but is now most characteristic of American racing yachts.

Racing Rules.—The ordinary rules of the road at sea apply in the main to yacht-racing. Yachts sailing with the wind free must clear those sailing close-hauled. Yachts on the port tack must give way to those on the starboard tack, and an overtaking yacht must clear the overtaken vessel. The start in a yacht race is now always a flying one, but prior to about 1860 yachts started from anchor. Frequently much depends upon the start, and accordingly maneuvering for initial position is of considerable importance. At the start, as throughout the race, the skipper counts for a good deal. The course to be traversed is marked out by buoys, light-ships, or flag-boats. The time allowances corresponding to differences in rating are determined in accordance with a scale prepared by the Yacht Racing Association. Vessels always start together, the time allowance being made at the end of the race. Handicapping is also practised to some extent in yacht-racing.

British Yachts and Races.—Among pioneer British yachts of the first half of the 19th century the most notable were the *Menai*, in which the hollow bow was first introduced; the *Mosquito* (1848), an iron vessel built on the Thames in accordance with Scott Russell's theories; and the *Tiara*, built at Renfrew in 1850. The visit of the *America* from the United States in 1851 marked an epoch in British yachting. She was a schooner of 208 tons, and entered along with 14 other vessels for a race round the Isle of Wight. Five of the vessels were schooners, nine were cutters, the remaining one being a bark (*Brilliant*), and though they varied in tonnage from 47 (*Aurora*) to 393 (*Brilliant*) no time allowance was given. The *America* won the race and the cup presented by the Royal Yacht Squadron, the *Aurora* coming second, 18 minutes behind. In 1857 the cup was set aside by the owners of the *America* as a perpetual international challenge trophy. This was the origin of the contests for the so-called America Cup, for which see the next section. The victory of the new-comer secured the triumph of the views represented in the *Mosquito* and the *Tiara*, and revolutionized the practice of British yachtsmen. For about a quarter of a century the schooner was the popular form of racing yacht, among the most notable being *Cambria* and *Miranda*. Gradually, however, the schooners were displaced by cutters and yawls.

The more famous of the early racing cutters were *Kriemhilda*, *Oimara*, *Cythera*, *Vol-au-Vent* (1875), and *Neva* (1876); and the leading yawls of that period were *Florinda* (1873) and *Julanar* (1877). *Formosa*, a big cutter built in 1878, was supreme in her class till 1880, when G. L. Watson's first large yacht, the *Vanduaara*, came on the scene. Another famous designer, Mr. Fife, scored a great success with the 40-ton yacht *Annasona*, which began to compete in 1881. Marjorie, from Watson's lines, a vessel of 68 tons, was the chief new cutter of 1883; and to the following year belong *Irex*, designed by Mr. Richardson, and *Genesta*, an America Cup competitor designed by Beaver Webb. The *Galatea*, another cup challenger, was a complete failure in home waters in 1885; but the challenger of 1887, *Thistle*, from Watson's design, met with great success before crossing the Atlantic. *Thistle* was the first large yacht constructed under the length-and-sail-area rule. *Yarana*, another Watson boat, was the chief novelty of 1888, and in 1889 the same designer produced *Valkyrie I.* for Lord Dunraven. The old *Irex* continued racing with considerable success down to 1889, and was succeeded in 1890 by *Iverna*, by the same designer. In the latter year *Thistle* reappeared, and thus the leading yachts of that season were *Yarana*, *Valkyrie I.*, *Thistle*, and *Iverna*. These were rated at 60, 77, 121, and 118 respectively. The *Valkyrie I.* was ultimately sold to an Austrian archduke, and the *Thistle* to the German emperor, who renamed it *Meteor*. The years 1891 and 1892 were chiefly remarkable for smaller vessels, such as Watson's *Queen Mab* and *Varuna* and Fife's *Thalia* and *Lais*; but 1893 was rendered memorable in the annals of yachting by fine contests between *Valkyrie II.*, designed by Mr. Watson for Lord Dunraven; *Britannia*, designed by Watson for the Prince of Wales; *Satanita*, *Calluna*, and *Navahoe*, an American yacht, designed by Mr. Herreshoff. *Valkyrie II.* proved to be the best of these cutters, but *Britannia* was a good second. In 1894 these yachts competed with *Vigilant*, a Herreshoff vessel which had defeated *Valkyrie II.* in the contest for the America Cup. *Valkyrie II.* was sunk by *Satanita* in the Clyde while maneuvering for a start, but *Britannia* repeatedly beat the *Vigilant*. The *Ailsa*, from lines by Mr. Fife, Jr., and the *Valkyrie III.*, designed by Mr. Watson for Lord Dunraven, appeared in 1895. The third *Valkyrie* went to America to contest the cup, and the honors at home fell to *Britannia* and *Ailsa*, especially the former. Mr. Fife, however, scored in the 40-raters with *Isolde*, which was distinctly better than Mr. Watson's *Caress*. A new *Meteor*, designed by Mr. Watson for the German emperor, competed in 1896 against *Britannia* and *Ailsa*, the result for the season being: *Ailsa* (60 starts, 21 firsts), *Britannia* (58 starts, 14 firsts), *Meteor* (22 starts, 13 firsts). The principal first-class cutters since that date are: *Bona*, by Watson (1897), for the Duke d'Abruzzi; *Shamrock I.*, built for Sir Thomas Lipton to contest the America Cup in 1899; and *Shamrock II.*, built for Sir Thomas Lipton to contest the America Cup in 1901.

American and International Yachting.—The *Jefferson*, built in 1801, is regarded as the first yacht built in America; but the first American yachts of importance were those designed by George Steers, notably the *America*. In 1866

YADKIN RIVER—YAKIMA

three American yachts, *Henrietta*, *Fleetwing*, and *Vesta*, raced across the Atlantic, the first-named winning the race with a time of 13 days, 21 hours, 55 minutes. In 1870 the English yacht *Cambria*, which had challenged for the America Cup, beat the American *Dauntless* in a transatlantic race, but she was beaten by the *Magic* and several other boats in the race for the cup. In 1873 Mr. Ashbury, who owned the *Cambria*, again challenged for the cup, but his yacht *Livonia* was defeated by the New York Club's vessels *Columbia* and *Sappho*. Major Charles Gifford, a Canadian, challenged for the America Cup in 1876 with the *Countess of Dufferin*, but his yacht was beaten by the defender, *Madeline*. Another Canadian vessel, the *Atlanta*, contested the cup in 1881, her opponent being the *Mischief*, but the result was the same as before. Sir Richard Sutton sent the next challenge in 1885, and his yacht *Genesta* was pitted against the *Puritan*, but without success. The *Puritan* was designed by Edward Burgess, as was also the *Mayflower*, which successfully defended the cup against the English *Galatea* in 1886. The *Thistle* met another Burgess boat, the *Volunteer*, in the same contest the following year, but, like all preceding challengers, she failed to gain the cup. Mr. Herreshoff scored his first great success as a designer with *Gloriana* in 1891, and soon afterward he produced the *Vigilant*, which defeated *Valkyrie II.* in the America Cup contest of 1893. The cup contest of 1895 between Lord Dunraven's *Valkyrie III.* and the American *Defender* had an unsatisfactory result. Two races were awarded to the latter on purely technical grounds, and in consequence Lord Dunraven withdrew from the competition. In the same year a Canadian yacht named *Canada* defeated the United States yacht *Vancedor* in a competition for an international cup. The next challenges for the America Cup came from Sir Thomas Lipton, whose yachts *Shamrock I.* and *Shamrock II.* were beaten by the American *Columbia* in 1899 and 1901 respectively. Sir Thomas again challenged for the cup in 1902 and 1903, and lost to the Americans.

Steam Yachts.—The use of steam has been a great factor in the increase of interest in private yachts. The cost of steam yachts varies widely even without taking into account the expenditures for furnishings. A yacht 160 feet in length may be built for \$60,000, while one of the 300-foot boats, the largest type, will cost from \$400,000 to \$500,000. One of the most superbly fitted private yachts, though not of the largest class, is the *Niagara*, owned by Howard Gould. It cost \$500,000, and requires \$10,000 a month to keep it in commission. The *Margarita II.*, built for Anthony J. Drexel, the Philadelphia banker, was very large and finely equipped. William K. Vanderbilt owns the *Valiant*, 332 feet long, and probably the largest American private yacht afloat. The *Mayflower* and *Nahma*, owned by the Goellets, were built on the Clyde. The most magnificent private yachts owned in Europe are the Hohenzollern, belonging to the Emperor of Germany, which visited New York in February-March 1902, and the *Atmah*, built for Baron Edmond de Rothschild.

Yad'kin River, North Carolina. See GREAT PEDEE.

Yad'rintsef, Nikolai Michailovitch, Russian author: b. Siberia 1842; d. Barnaul, Altai

Mountains, 19 June 1894. Accused in youth of conspiring for the independence of Siberia, he was exiled to Archangel, but later was permitted to return and was appointed on the staff of Gov.-Gen. Kaznakof. Between 1865 and 1875 he traveled extensively in Siberia, publishing the results of his explorations and in 1882 founded the 'Eastern Review,' a strong, popular weekly devoted to the interests of Asiatic Russia. In 1891-2 he made careful explorations in Mongolia, discovering the ruins of the ancient capital of the Tartar Khans, and forming archaeological collections of great value. In 1893 he visited the United States. He was the founder of the Siberian University, and a promoter of universal education. Among his works are: 'The Russian Commune in Prison and in Exile'; 'Siberia as a Colony'; 'The Culture and Industrial State of Siberia'; etc.

Yaguarondi, yä-gwä-rün'de. See JAGUARONDI.

Yahoo, yä-hoo', a name given by Swift in his 'Gulliver's Travels' to a race of brutes, described as having human forms and degraded propensities. They were subject to the Houyhnhnms, or horses endowed with human reason. Hence, the term is applied to a rough, low, boorish, or uneducated person.

Yajur Veda, yä'joor vä'da. See VEDA.

Yak, the native name for the wild ox (*Bos grunniens*) of the mountainous regions of Tibet. There are two races: the wild yak, generally black, which is found near the snow line, descending into the valleys in winter, and a domesticated race of various colors, black and white being most common. The yak is about the size of the common ox, to which it has a general resemblance, but it is covered with a thick coat of long, silky hair, hanging down like the fleece of a sheep, completely investing the tail, and forming a lengthy fringe along the shoulders, flanks, and thighs. This fringe, which exists in both races, was apparently developed as a protection to the animal in its alpine haunts, as the long hair forms a sort of mat which defends the body from the effects of the cold when the animal is reposing in the snow.

The domesticated race is of great importance to the natives of Tibet. The yak is employed as a beast of burden, but never for tillage or draught; the milk is very rich, and yields excellent butter; the flesh is of the finest quality, and that of the calves far superior to ordinary veal. The hair is spun into ropes, and made into coverings for tents, and the soft fur of the hump and withers is woven into a fine strong cloth. The tails, often dyed red, are made into the chowries or fly-flappers, used in India. Yaks are often seen in zoological gardens and menageries, and have repeatedly been bred in Europe; and it is probable that they might be advantageously introduced into the northern parts of the continents of America and Europe.

Yakima, yäk'ī-mä. See SHAHAPTIAN INDIANS.

Yakima, a river of the State of Washington, rising in the Cascade Mountains, and after a southeastward course of about 175 miles, flowing into the Columbia about six miles north of Pasco and Kennewick, and 10 miles above the confluence of the Snake River. It flows through an important coal-mining region, and its valley and those of its numerous short tributaries are

YAKIMA PASS—YALE

among the most fertile in the State. The Northern Pacific Railway traverses the whole length of the valley of the Yakima, almost to its source.

Yakima, or **Stampede Pass**, a defile over the Cascade Mountains, in the State of Washington, near the source of the Yakima River (q.v.). Its highest point is 3,600 feet. It is crossed by the Northern Pacific Railway, which at an elevation of 2,800 feet, between Martin and Stampede, passes through the Stampede Tunnel, 9,850 feet long.

Yakoba, *yä-kô'bä*, or **Yakubu**, West Africa, a town in northern Nigeria, finely situated on a plateau partly surrounded by mountains, 140 miles southeast of Kano. It is walled, and the interior is finely diversified with gardens and ponds. The climate is healthful. Pop. 50,000.

Yakonan (from *yakwina*, "spirit"). A linguistic stock of North American Indians, consisting of the Alsea, Yakwina, Kuich, and Siuslaw divisions. The home of the Yakwina was along Yaquina River, Oregon, from the site of Elk City to the sea; they were formerly numerous, occupying 56 villages in early days, but the tribal distinction of the Yakwina, as well as of the other Yakonan divisions, was gradually broken down through extensive intermarriage; there are only a few Yakwina left and these reside on Siletz reservation, but their number is unknown. The Alsea formerly dwelt in villages along both sides of Alsea River, Oregon, and on the adjacent coast; they are now on Siletz reservation, and perhaps a few are on Grande Ronde reservation. The Siuslaw were also village dwellers, inhabiting Siuslaw River as late as 1857; they are probably extinct. The Kuich, or Lower Umpqua, villages were on both sides of Umpqua River from its mouth upward for 30 miles; a few survivors still reside on Siletz reservation. The entire population of the Yakonan Indians probably does not exceed 400.

Yakub Beg, *yä-koob' bög*, surnamed **ATTALIK GHAZI** ("leader of the champions of the faith"), amir of Kashgar: b. Russian Turkestan early in the 19th century; d. 31 May 1877. He distinguished himself in the defense of Khokan against the Russians. But he first rose to great eminence after the recovery of Kashgar from the Chinese in 1864, when he acted as lieutenant to Buzurg Khan, whom he soon supplanted. For 12 years this remarkable man conferred on a large part of Central Asia the benefits of a settled though rigorous government. He drilled and disciplined a large civil staff, while his army contained the best native soldiers in Central Asia. In his foreign policy he was strongly anti-Russian, and ultimately friendly to Great Britain. China, however, set out to recover its lost Mohammedan provinces, and had gained some victories when Yakub died—by assassination, some said. His realm at once fell in pieces. The Chinese armies overran the country (1878), and Kashgar again came under Chinese rule.

Yakub Khan, *khän*, amir of Afghanistan: b. 1849. Appointed governor of Herat, he became extremely popular, but in 1870 broke into open revolt, and in 1874 was imprisoned at Kabul. On the death of Shere Ali he was proclaimed amir (1879) and concluded a treaty of peace with the British at Gandamak. By the

terms of this treaty he was to receive a British resident, and on his side to obtain from the British government a subsidy and aid in case of foreign attack. The murder of Sir Louis Cavagnari, the resident, with staff and suite, occurred in the following September. Yakub was suspected of complicity. Lord Roberts (then Sir Frederick) defeated the Afghan force 6 October and seized Kabul on the 12th. Yakub abdicated and fled to the British camp. In December he was sent to India as a deposed ruler.

Yakutsk, *yä kootsk'*, Asiatic Russia (1) A town of Eastern Siberia, capital of the government of the same name, on a plain surrounded by lofty heights, on the left bank of the Lena. The streets present a singular aspect, being composed of about 400 houses of European structure, standing apart, while the intervening spaces are occupied by winter *yurts* or huts of the northern nomads, with walls of cow-dung, earthen roofs, and doors covered with hairy hides. The principal buildings of the town are a large stone cathedral, other churches, a synagogue, a market-house, and several educational institutions. The trade is important, Yakutsk being the chief commercial emporium for the whole of Eastern Siberia. The principal articles of native produce are furs and fossil ivory, which are exchanged for European produce. Important fairs are held. Pop. (1897) 6,534. (2) The government of Yakutsk has an area of 1,517,696 square miles, or about two fifths of that of Europe. The surface is generally low in the north, but rises toward the interior, and in the south and east is covered by the Yablonoi or Stanovoi Mountains and their offshoots. A noteworthy feature of the country is the *tundras*, immense boggy plains, which stretch along the north. Farther south there are good pastures, and wheat and rye are successfully cultivated, even where the ground is frozen to a depth of 600 feet, the summer heat being strong enough to thaw it sufficiently deep for cultivation. There are a number of large rivers teeming with fish, the principal being the Lena. There are valuable forests in the south, frequented by numerous fur-bearing and other animals. Caravans with Chinese and European goods collect the produce of the whole line of coast on the Polar Sea between the parallels of 70° and 74°, from the mouth of the river Lena to the farthest point inhabited by the Tchukchis. The towns are chiefly inhabited by Turks and Cossacks, but the great body of the people are nomads, consisting of Yakuts, Tunguses, etc. Pop. (1897) 261,731.

Yale, **Elihu**, English philanthropist: b. in or near Boston, Mass., 5 April 1648; d. London, England, 8 July 1721. His father was Thomas Yale, one of the original settlers in New Haven, Conn., in 1638, but who removed to Boston soon after and to England in 1651, followed by his family the next year. The son was educated in England, engaged in trade in India in 1672, and in 1687–92 was governor of the East India Company's fort at Madras. He returned to England in 1692 and although he never revisited New England he displayed his interest in the Collegiate School founded at Saybrook in 1700 by sending gifts of money and books to the amount of some £600 in 1715, 1718, and 1721. The largest gift, that in 1718, followed a suggestion from the college authorities that the college

building then being erected in New Haven might be named for him. In 1745 the whole institution received the name of Yale College in his honor. Yale's latest years were passed at Wrexham, Denbighshire, North Wales, and his body is buried in the magnificent parish church there.

Yale, Linus, American inventor: b. Salisbury, N. Y., 4 April 1821; d. New York 24 Dec. 1868. In 1851 he patented a safety lock, and for the rest of his life was a recognized authority on all matters pertaining to locks and safes. Becoming convinced of the necessity of abandoning the use of a keyhole as affording an easy means of introduction to the lock mechanism, he was led to the adoption of the permanent dial and shaft as used in the combination locks, and subsequently to the perfection of what is known as the "clock" lock. His most notable invention was the double lock, which comprised two locks within a single case, and was operated by the same or different combinations. He received gold, silver, and bronze medals as first awards at various expositions.

Yale University, located at New Haven, Conn. From the time of the first settlement of the New Haven Colony in 1638, the establishment of a college there was contemplated. It was not until 1700, however, that definite action was taken by 10 ministers of Connecticut, and a charter was obtained in 1701 for the establishment of the Collegiate School of Connecticut. This school was first located at Saybrook, but until 1707 the classes were taught at Kellingworth, a neighboring town, where the pastor, Abraham Pierson, was the first rector of the school. In 1716 the school was removed to New Haven, and in 1718, the name was changed to Yale College, in honor of Elihu Yale (q.v.), who had given largely to the Collegiate School. The first building was also completed in 1718. In 1745 a new charter was granted by which the full name of the corporation was The President and Fellows of Yale College. Until after the Revolution the college received occasional grants of money from the colonial government; in 1792 the State made a grant of about \$30,000, and the governor lieutenant and governor and six senators were made members *ex-officio* of the corporation. In 1795 Timothy Dwight (q.v.) became president, and during his administration the college attained a higher degree of prosperity than ever before; the college grounds were extended; permanent professorships were established, and the establishment of separate professional schools planned. The Medical School, however, was the only one established (1813) during President Dwight's lifetime. The Divinity School was organized in 1822, and the Law School in 1824, though instruction in theology had been given since the beginning of the college, and instruction in law for some years prior to 1824. The Sheffield Scientific School was established in 1847, and the School of Fine Arts in 1866. The elective system was adopted during the administration of Noah Porter, and from 1886-99 the college still further extended its course and doubled its number of students; the name was changed to Yale University in 1887. In 1872 provision was made by the State legislature for the substitution of graduates in the place of the six State senators in the corporation, so that the corporation now consists of 10 Congregational ministers, the successors of

the founders, six representatives of the alumni, the governor and the lieutenant-governor of Connecticut. In October 1901 the bicentennial anniversary was celebrated with appropriate ceremonies on the university grounds. There were 4,691 Yale graduates present at the anniversary ceremonies, and in addition, 311 former students, not graduates, and 147 holders of higher degrees from Yale. The President of the United States, and representatives from every leading American university and college, and from many foreign universities, were also present. The exercises included addresses by alumni and distinguished guests, a procession in which graduates and undergraduates took part, the "Dramatics," scenes in the history of the university given by the students' Dramatic Society, and the dedication of Woodbridge Hall, the administration building.

The university includes four departments — the Department of Philosophy and Arts, the Department of Theology, the Department of Medicine, and the Department of Law. In the Department of Philosophy and Arts are included the Academical Department of the college, the Sheffield Scientific School, the Graduate School, the School of Fine Arts, the Department of Music, and the Forest School. The University Library, the Peabody Museum of Natural History, the Observatory, and several other adjuncts to the university are organized independently of the separate departments. The undergraduate course in the college covers four years, and leads to the degree of A.B. To receive this degree the student must successfully complete courses aggregating 60 hours per week through a year; three courses which shall be a continuation of subjects offered for admission, are required in the Freshman year. Otherwise the work is elective. The courses are arranged in three groups:

1. Language and Literature.
2. Mathematics and the Sciences.
3. Philosophy, History, and the Social Sciences.

Each student is required to complete two majors and three minors so arranged that not more than two of the five units shall be chosen from any one group. A major consists of connected courses of grades A, B and C, aggregating at least seven hours a week; a minor, of connected courses of grades A and B, aggregating at least five hours a week. The rest of the required number of hours are free electives. Sanskrit, Norwegian, Danish, and Swedish, and pedagogy are included in the curriculum. The Sheffield Scientific School was first organized in 1847, and received its present name in 1860; from 1863-92 it was the State College of Agriculture and Mechanic Arts, and received the national grants for such institutions. It offers undergraduate courses of three years; French and German, English, and general science are included in all courses, and the work of the Freshman year is much the same for all.

In the last two years the courses most distinctly marked out are in civil, mechanical, electrical, municipal, and sanitary engineering, in engineering preparatory to mining, in chemistry, in chemistry preparatory to metallurgy, in natural history, in mineralogy and other studies preparatory to geology, in biology preparatory to medicine, in studies preparatory to a forestry course, and in select studies preparatory to other

YALU

higher studies. The School of Fine Arts offers both technical courses and courses in art history and criticism; the regular course is three years in length for the completion of which a diploma is conferred. The degree of Bachelor of Fine Arts is conferred on the completion of certain advanced studies and the presentation of a thesis. The Department of Music offers both theoretical and practical courses. The degree of Bachelor of Music is conferred for the completion of advanced courses. The Yale Forest School was established in 1900; it offers a two years' course, the work of the second year being largely field work. The degree of Master of Forestry is conferred on those who have received a bachelor's degree or have had the equivalent of college training. A Summer School of Forestry is also maintained at Milford, Pa. The Graduate School was organized as a separate school in 1847, the professors of the other sections of the Department of Philosophy and the Arts constitute the faculty of the Graduate School. Graduate courses are offered in the Academic Department, the Scientific Department, the School of Fine Arts, and the Department of Music. The degrees conferred are A.M., M.S., Ph.D., C.E., and M.E. In addition to regular class and laboratory work of the school there are numerous voluntary associations of professors and students for the advancement of graduate work in the several departments of study. The Divinity School offers a regular course of three years leading to the degree of B.D. Seniors in the college may elect such courses in the Divinity School as to shorten the course to two years. A fourth year of graduate work is also provided. The work includes both prescribed and elective courses; elective courses in sociology, and in the study of missions, are included in the curriculum. The Medical School offers a four years' course leading to the degree of M.D. Ample provision for clinical work is made in the New Haven Hospital, the State Hospital for the Insane at Middletown, and the Springside Hospital. The Law School course covers three years. Previous to 1896 it was two years in length. The degrees of Bachelor of Laws and Bachelor of Civil Law are conferred, the same amount of work being required in each course. Students in the college may so arrange their course as to receive the degrees of arts and laws in six years. Graduate courses are provided, leading to degree of Master of Laws, and Doctor of Civil Law. The school was the first in America or England to establish a course leading to the latter degree.

Women are admitted to the School of Fine Arts, the Department of Music, and the Ph.D. courses of the Graduate School, and public school teachers are admitted to some of the regular courses. Numerous scholarships and fellowships are provided in the Academic Department, the Scientific School, the Divinity School, and the Graduate School. A "Bureau of Self Help" is maintained, through which students are aided in obtaining employment. The university maintains a public lecture course, and provides several series of lectures in the different departments; prominent among the latter are the Lyman Beecher lectures on preaching, the Silliman Memorial lectures, the Dodge lectures on the responsibility of citizenship, and the Bromley lectures on journalism, literature and public

affairs. The University Library in 1904 contained 290,000 volumes, exclusive of pamphlets. In addition there are several special libraries, including the Linonian and Brothers Library, the Dwight Hall Library, the Law Library, the Scientific School Library, the Trowbridge Reference Library of the Divinity School, the Lowell Mason Library of Church Music, the Library of Foreign Missions and several department and club libraries. The Peabody Museum was established in 1866 by a gift of George Peabody (q.v.) and contains excellent collections in mineralogy, geology and paleontology, and zoology.

Of the buildings of the university, Dwight Hall, Alumni Hall, Durfee Hall, Battell Chapel, Farnam Hall, Lawrence Hall, Phelps Hall, Welch Hall, Osborn Hall, Vanderbilt Hall, Art School, the Library, and South Middle College, are grouped about the college campus, which is rectangular in shape. In another group to the north are the bicentennial buildings, built largely by the alumni at the time of the anniversary; these are Woodbridge Hall, Woolsey Hall, Memorial Hall, and University Hall. The gymnasium is situated to the northwest of the college campus, near the Peabody Museum, Herrick Hall, White Hall, and Pierson Hall. The Scientific School occupies seven buildings, lying northeast of the bicentennial buildings. The Divinity School lies to the south of this group. Hendrie Hall (the Law School) lies east of the main campus, facing the Green. The Medical Hall and the Medical School Laboratory lie to the west of the campus; the University Clinic Building is opposite the New Haven Hospital; the Forest School occupies Marsh Hall, the house of the late Professor Marsh, in the Botanical Gardens. The athletic field of 30 acres is situated about a mile from the campus. The students maintain a Christian Association, an Athletic Association, numerous literary, dramatic, and technical societies, and social, and special literary and technical clubs. A chapter of Phi Beta Kappa is also located at Yale. Yale has long taken a prominent part in inter-collegiate athletics, and general physical training is given full attention. The students in 1903-4 numbered 3,142, of whom 1,250 were in the college, 837 in the Scientific School, 141 in the Medical School, and 259 in the Law School. The faculty numbered 384.

Yale ranks as one of the leading American universities, in number of students, standards of scholarship and in the influence exercised through her graduates on national life. Some of the most distinguished men in literary and political life have been graduates of Yale.

Yalu, yā'loo, Korea, a river forming the boundary with Manchuria. In its upper reaches it is known as the Am-nok or Ap-nok. Its source is in the Paik-tu-san, the highest peak (8,000 feet) of the Shan-a-lin Mountains of Manchuria. It flows into Korea Bay, near Wi-ju, after a southwesterly course of about 300 miles, and has numerous tributaries, chief of which is the Chang-jin River. It is navigable for sea-going vessels 30 miles from its mouth, and by smaller vessels 145 miles to Wi-wen. On 17 Sept. 1894 its mouth was the scene of the battle in which a Chinese fleet of 12 warships, some of them powerful ironclads, and 16 other vessels, was defeated, with the loss of four vessels, by a Japanese force of 11 war vessels and two

MARSHAL YAMAGATA.

others. During the Russo-Japanese war of 1904 its banks witnessed much skirmishing and fighting at various strategic points.

Yam, a popular name for various species of the genus *Dioscorea* of the order *Dioscoreaceae*, and loosely applied to certain varieties of the sweet potato. The true yams belong to a genus consisting of more than 150 species widely distributed throughout the tropics. They have herbaceous, twining or creeping stems; broad, alternate or opposite, usually simple leaves; and small dioecious flowers, followed by three-winged capsular fruits containing winged seeds. The fleshy roots of some species are widely eaten in the tropics. One of the best known species is *D. alata*, a native of India and the South Sea Islands, but distributed throughout the tropics. Its tubers usually attain a length of three feet and a weight of 30 pounds, but specimens three times as large are not uncommon. They are black or brownish externally and pink within, and are rich in starch. When boiled their acidity is dispelled and they become of pleasant flavor. It is claimed that this species is the parent of most of the edible so-called species such as *D. sativa*, *D. aculeata*, *D. rubella*, *D. globosa*, etc. The air-potato (*D. bulbifera*) is an Asiatic species cultivated to a small extent in the southern United States, and in conservatories, for its odd, angled tubers, which are borne in the axils of the leaves. They often exceed two pounds in weight and are sometimes eaten like potatoes. The Chinese yam, Chinese potato, or cinnamon vine (*D. divaricata*), is a native of the Philippine Islands, whence it has been introduced into the gardens of temperate as well as tropical climates for ornament. It bears cinnamon-scented white blossoms, aerial tubers which are used for propagation. As far north as New York the plants have proved hardy.

Yam-a-mai, an Oriental kind of silkworm which feeds on the oak, and produces a silk with peculiar, but useful qualities, extensively utilized in Japan and somewhat elsewhere. See SILKWORM.

Yama, yā-mā', a Hindu god, the judge of the dead, whose good and bad actions are read to him out of a record, and who according to their merits and demerits are sent to the celestial or to the infernal regions. Hindus offer to him daily oblations of water. See also LAMAISM.

Yamagata, yā-mā-gā'tā, **Aritomo**, MARQUIS, Japanese soldier and statesman: b. Chōshū (or Nagato) province 1838. He was active in the overthrow of the shōgunate, and was made second vice-minister of war under the new government. In 1869 he visited Russia and France for study of their military institutions. In 1876-7 he ably directed the Satsuma rebellion campaign, in 1878 was made commander of the imperial guard and chief of the general staff. He was prime-minister in 1889-91, in which post he greatly strengthened the army and navy; and minister of justice in 1891-3. He was appointed to command the first army corps in the war with China in 1894, and quickly expelled the Chinese from Korea. His policy was throughout one of study of Western methods. He was a skilful strategist, and was for his services made field-marshal.

Yamagata, Japan, a town in the island of Hondo, capital of a prefecture, 200 miles north of Tokyo. Pop. (1899) 35,300.

Yamaguchi, yā-mā-goo'chē, Japan, city, capital and chief city of the prefecture of Yamaguchi, in the southwestern part of the island of Hondo; 15 miles back from the coast. It was formerly the residence of the lords of Choshū, a Mori family, and became the seat of the local government in 1860. In 1550 a church was established here by Francis Xavier, but was finally destroyed. Pop. (1899) 42,780.

Yamaji, yā-mā-jē, **Motoharu**, VISCOUNT, Japanese soldier: b. Tosa province, island of Shikoku, about 1840. He won distinction in the campaign against the unsuccessful revolt in Satsuma province (island of Kiu-siu) in 1877; and was promoted lieutenant-general. In the Chinese-Japanese war of 1894-5 he had the immediate direction of the attack on Port Arthur, which was finally taken on 22 Nov. 1894. This won for him a great reputation in Japan, where, in allusion to his loss of an eye, he is known as the "One-Eyed Dragon."

Yamanou'chi Gun. See ORDNANCE.

Yamaska, yā-mās'ka, Quebec, Canada; (1) a village and railway junction of Yamaska County, on the Yamaska River, 31 miles north of Saint Hyacinthe. The river affords power for several mills. Pop. (1901) 762. (2) A county bordering on Lake Saint Peter; area, 183,705 acres. Capital, Saint François du Lac. It is drained by the Yamaska, Nicolet, and Saint Francis rivers. Pop. (1901) 16,204. (3) A river flowing from Brome Lake, Brome County, and after a course of about 100 miles through a fertile country, draining into the Saint Lawrence River at Lake Saint Peter.

Yambo, yām'bō, **Yambu**, yām'boo, or **Yembo-El-Bahr**, yēm'bō-ēl-bār, Arabia, a seaport town on the Red Sea, in the province of Hedjas, 131 miles east of Medina, of which it is the harbor. Marking the end of the third quarter of the caravan journey from Cairo to Mecca, the town bears the title "Gate of the Holy City." The town consists of a long row of white houses built of limestone and coral-line, standing on the edge of an arid plain. It has considerable imports and transit trade between Suez, Jidda, and Medina. Pop. est. 7,000.

Yana ("people"), a small tribe, forming the Yanan linguistic stock of North American Indians, whose former habitat was bounded on the east by a mountain range a little west of Lassen Butte, and terminating near Pit River, in northern California; on the north by a line running northeast to southwest, passing near the northern side of Round Mountain, three miles from Pit River; on the west by a line extending from Redding southward on an average 10 miles to the eastward from Sacramento River; north of Redding it approximates twice that distance. The tribe and stock were represented in 1884 by 35 individuals divided into two groups—one at Redding, the other in their original country at Round Mountain. They have a tradition to the effect that they came from the East, and it is said that in physical traits they differ markedly from all the northern California Indians.

Yana, yā'nā, or **Jana**, Eastern Siberia, a river which rises in the Verkhoyanskii Moun-

YANCEY

tains, and after a northerly course of about 750 miles enters the Arctic Ocean, near Ustjansk, by seven large and many small mouths.

Yancey, yān'sī, **William Lowndes**, American lawyer, orator, and statesman: b. Falls of Ogeechee, Hancock County, Ga., 10 Aug. 1814; d. near Montgomery, Ala., 27 July 1863. He was the son of Benjamin Cudworth Yancey of Charleston, S. C. His mother was a daughter of Col. William Bird, a descendant of the historic family of "Birdsville," Pennsylvania. The Yanceys were landed proprietors of Virginia in the time of Charles II., and the Cudworths were New England people, devoted patriots in the Revolution. Capt. Joseph Yancey fell at Eutaw Springs, and Maj. James Yancey of the Virginia Continental forces, having come to South Carolina with General Nathaniel Greene, settled there after the war, and became a lawyer and statesman. Benjamin Cudworth, the father of William, was the son of James. As midshipman he had fought the French under Truxton. Yancey's first recourse to attain influence in Federal affairs was in an election to the House of Representatives of Congress. He was successful under a most flattering vote of an Alabama district in 1844 at a special election to fill an unexpired term. The next year he was returned to office without opposition. Yancey resigned at the close of the Twenty-ninth Congress, in the summer of 1846, because he had discovered that any movement which might be necessary to save the South in possession of slavery must come from the people direct without the intervention of their representatives in Congress. He returned to his law office at Montgomery, persistently refused public office and eagerly entered upon the self-appointed tribuneship, the task of educating and animating the Southern masses in the principles of States' rights.

The candidature of General Zachary Taylor as the nominee of the Whigs for President of the United States, in 1848, proved a disturbing influence in the Democratic State of Alabama. The long-prostrate Whigs were quick to seize the occasion. In January 1848, they invited all persons favorable to General Taylor's election to assemble at Montgomery in convention. Democrats of high position in party politics answered to the summons. In the next month, the customary State Convention of the Democratic party met at the same place to appoint delegates to the approaching quadrennial National Democratic Convention to meet at Baltimore. In the action of this State Convention Yancey attained to national reputation that never waned. With tact and intellectual prowess he then and there laid the predicate of that agitation which accepted his personal leadership as long as he lived. In anticipation of this meeting, he prepared at his law desk the resolutions that he intended the Democrats of Alabama should present for ratification at the Baltimore Convention. The usual committee on resolutions brought into the State Convention its report. Yancey rose on the floor, drew from his pocket his own substitute, read what he had written, spoke 45 minutes to his own motion, and without a dissenting voice carried it. The substitute was adopted and remained before the country, the pivotal question of Federal politics, until the election of Abraham Lincoln

to the Presidency, in 1860, in token of the final adverse settlement of the proposition set forth by it. The few pages of manuscript that Yancey read of his own construction became the "Alabama Platform." It was not in the nature of suggestion, that the laws of Alabama should go to the common domain to protect the property of Alabama settlers there; but that the laws of Massachusetts should not be permitted to deny to Alabama settlers on the common domain their rights of property as secured by the Federal Constitution. Number 9 of the Yancey resolutions declared: "That the [pending] treaty [with Mexico] should contain a clause securing an entry into those [conquered] territories to all citizens of the United States, together with their property of every description, and that the same should remain protected by the United States while the territories shall continue under its authority."

Yancey was appointed by the Convention the leader of its delegation to Baltimore; the National Democratic Convention refused the principle of the Alabama Platform. Yancey withdrew from participation in its proceedings, returned to Alabama and took the field against General Cass, the Democratic nominee for President. Without advocating Taylor's election he proclaimed from a hundred "stumps" the peril of the cause of the South in support of Cass.

The people of Alabama declined Yancey's advice, in 1850, to secede from the Union. He bided his time, speaking and writing industriously his unflagging sentiments. In 1856 he succeeded in accomplishing the re-organization of the State Democratic party, opening its doors to all who would follow him. Under the spell of his eloquence, the Alabama Democratic Convention of that year re-adopted the Alabama Platform as prepared by him in 1848 and sent it with gratifying results to the quadrennial National Democratic Convention at Cincinnati. As the head of the electoral ticket he canvassed the State, for the first time, for Buchanan and Breckenridge and fixed upon immovable foundations his influence in the generation about him. When Yancey took his seat in the Charleston National Democratic Convention of 1860, he was the acknowledged leader of the South. He was selected by the 15 Southern States in a body to speak for them in argument with the Northern States. He spoke and the Convention was disrupted and the party virtually dissolved, but Yancey desired neither the disruption of the Convention nor the dissolution of the party. He did not expect the election of a Democrat of either faction, Northern or Southern, to the Presidency, even if the factions should unite. The 16 Northern States, that already had Republican State governments and that controlled the election, were not likely to choose Democratic Presidential electors. Yancey looking forward at Charleston to the election of the Republican party candidate to the Presidency, anxiously desired to see the South united in opposition, pending the campaign, to the end that the longed-for Southern Confederacy might be made more sure at the close of the campaign.

Yancey entered the North in the last months of the Presidential campaign of 1860. He spoke at Cooper Institute, at Albany, Syracuse, and Rochester, and at Faneuil Hall. Ostensibly the object of his oratory was to turn opinion to

W. L. YANCEY.

YANG AND YIN—YANKTON

Douglas as the compromise candidate for the Presidency; really he spoke to present to the people of the North finally the Southern argument of self-defense. His audiences, always numbered by the capacity of the hall, were in the main friends of Lincoln. Streets were lighted in his honor, houses were decorated, long processions escorted him. The impression of his oratory was phenomenal. On the night of 20 October he appeared in the last of his Northern appointments at Pike's Opera House, Cincinnati. A grave editorial notice of the event appeared in a local and unfriendly newspaper of the first class the next morning: "Pike's Opera House was crowded to its utmost capacity last evening and contained probably the largest audience ever within its walls, to listen to an address from the Hon. William L. Yancey of Alabama. The notoriety of the man, his great agency in promoting the disruption of the Charleston and Baltimore Conventions, the novelty of hearing one entertaining his extreme views on the slavery question, together with his powers as an orator, would naturally draw him a great audience in this city. . . . His address was about two hours and was listened to with the most profound and marked attention."

Yancey was appointed by President Jefferson Davis immediately upon the organization of the Confederate government, in February 1861, president of a commission of three to the states of western Europe, to seek the recognition of the Southern government. He accepted the post reluctantly. Yielding his will, he desired to be instructed to offer to England and France, unitedly or singly, special privileges of commerce in the Confederate ports for a long period, not less than 20 years, in return for the act of recognition of either or both. In his absence on the foreign mission he heard of his unanimous election to the Senate of the Confederate States and having despaired of effecting good in Europe while denied the instructions from his government that policy suggested, he returned to Alabama. Yancey's service in the Senate of the Confederate States continued as long as he lived. He bitterly resented the inefficiency of the government of President Davis. He urged a war of invasion from the South upon the North, the shipment of all the cotton in the South to Europe, the importation of European arms and supplies without limit at a time when the blockade by the United States was known to be ineffective.

JOHN WITHERSPOON DU BOSE,
Author of 'Life and Times of Yancey.'

Yang and Yin, in Chinese philosophy, terms employed to indicate the two phases under which the supreme principle of the universe, *Tai-ki*, displays itself in the world of phenomena, Yang and Yin being, in various proportions, blended in all forms of existence.

Yang-tse-kiang, *yāng'tsě-kě-āng*, the name generally given to one of the greatest rivers of China throughout its entire course, although this name is only applied in China to the lower course of the river, the entire river being called simply Kiang, or Ta Kiang (river or great river), while in the various provinces it traverses it is generally known by special names. It rises in the Tangle Mountains in mid-Tibet, about lat. 35° N. and lon. 89° E., and is first known by the name of Muru-Ussu. In its upper course

it is sometimes called the *Kin-cha-kiang*. Its upper course through the mountainous region of Tibet extends to about 1,100 miles, during which its windings and falls present numerous striking scenes of natural beauty. It crosses the Chinese frontier in the province of Yunnan. Between the town of Li-kiang in this province, and Hui-li in Sze-chuen, for a course of about 250 miles, it flows in an easterly direction through a winding channel or mountain gorge of imposing grandeur. Traversing the whole province of Sze-chuen in a northeasterly direction, and passing in southeasterly direction into the province of Hu-peh, it reaches at King-chau the great Chinese plain, and traversing the provinces of Ngan-hui and Kiang-su, and passing the cities of Han-Yang, Han-kau, and Wu-chang, a great seat of the tea exporting trade, Ngan-king, Nanking, and Chin-kiang, it enters the Tung-hai, or Eastern Sea, above Shanghai. Its direct course from its source to its mouth is estimated at 1,800 miles; its course with windings is about or considerably over 3,000. It receives numerous affluents, and is crossed by the Grand Canal, which forms a junction between it and the Hoang-ho. The river and the ports of Chin-kiang and Han-kau were opened to foreign navigation in 1860, I-chang (1,000 miles up), and others since. A British squadron sailed up the river in 1861 for more than 800 miles. The navigation above the confluence of the Tung-ting is interrupted by rapids. The tidal influence reaches in February to Lake Poyang, 436 miles from the sea. Consult Little, 'Through the Yang-tse Gorges' (1898).

Yankee, a cant name for Americans belonging to the New England States. During the Revolution the name was applied by the British to all the insurgents; and during the Civil War it was the common designation of the Federal soldiers by the Confederates. In Great Britain the term is sometimes improperly applied generally to natives of the United States. The most common explanation of the term seems also the most plausible, namely, that it is a corrupt pronunciation of English or of French *Anglais* formerly current among the American Indians.

Yankee Doodle. The air of Yankee Doodle is said to have been a British air known in the time of Cromwell by the name of Nankee-Doodle, and played with derisive reference to the similarity of this name to Yankee by the British troops in evacuating Boston. The Americans took it up and made it their national air. It has since been superseded by 'Hail, Columbia.' See NATIONAL SONGS.

Yankee Gang, a term used in sawmills for an arrangement adapted for logs 21 inches diameter and under. It consists of two sets of gang saws, having parallel ways in the immediate vicinity of each other. One is the slabbing gang, and reduces the log to a balk and slab boards. The balk is then shifted to the stock gang, which rips it into lumber.

Yank'ton, S. Dak., city, county-seat of Yankton County; on the Missouri River, and on the Chicago, M. & St. P., the Great Northern, and the Chicago & N. R.R.'s; 60 miles northwest of Sioux City and 135 miles northwest of Omaha, Neb. It has steamer connection with the Missouri River ports. The city is the commercial and industrial centre of a

YANKTON COLLEGE — YARMOUTH

large agricultural and stock-raising region. The chief industrial establishments are Portland-cement works, breweries, pork-packing establishments, flour mills, woolen mills, brick yards, grain elevators, and stock yards. The city owns and operates the water-works. The educational institutions are Yankton College (Congregational), opened in 1882; Saint Joseph's Academy, a public high school, public and parish elementary schools. It has the South Dakota Hospital for the Insane and a hospital in charge of the Sisters of Saint Benedict. Yankton's water supply is obtained partly from artesian wells. There are two national banks, one State, and the American Mortgage Company; the four have a combined capital of \$175,000. The government is administered under a revised charter of 1885 which provides for a mayor, who holds office one year, and a council. Yankton was settled by Eastern people in 1862, and in 1883 received a city charter. Until 1883 it was the capital of the Territory of Dakota. Pop. (1890) 3,670; (1900) 4,125.

Yankton College, located at Yankton, S. Dak. It was established by the General Association of Congregational Churches of Dakota in 1881, and opened to students in 1882, and is the oldest institution of higher learning in the Dakotas. The majority of the corporate body which elects the trustees must be members of Congregational churches; otherwise the college is non-sectarian. It is open to both men and women. The organization includes the following departments: (1) the College; (2) the Academy; (3) the Conservatory of Music; (4) the Department of Art; (5) the Department of Elocution; (6) the Department of Physical Training; (7) the Department of Stenography. The college offers three four years' courses, the classical, the philosophical, and the scientific, leading to the degrees of B.A., B.Ph., and B.S. respectively. The work of the freshman year is required in all courses; elective work begins in the sophomore year and increases progressively in the junior and senior years. Greek is required for the A.B. degree; one course in Bible study is required of all students, and there are other elective courses; courses in pedagogy are included in the curriculum. The Conservatory of Music offers courses of three to five years in pianoforte, pipe organ, voice, and violin. The course in stenography covers one year. Gymnasium work is required of both men and women, and there is also an athletic park, and ample provision for athletic sports. The students maintain Young Men's and Young Women's Christian associations, literary societies, a branch of the Inter-Collegiate Oratorical Association, and athletic associations. The college has an attractive campus of 25 acres, including the Athletic Park (five acres) to the north of the main campus, and Observatory Hill to the south. The buildings are Middle College, Dakin Hall, the Ward Hall of Science, Clarke Observatory, and the gymnasium; a new library building, the gift of Andrew Carnegie, was in process of construction in 1904. A Summer School was established in 1903. The students in 1904 numbered 338, of whom 59 were in the College, 79 in the Conservatory of Music, 132 in the Summer School.

Yapock, a small, rat-like marsupial (*Cheironectes variegatus*) of the opossum fam-

ily (*Didelphyidae*), which is found in Central and South America. It is rather larger than a common rat, with large, naked ears, and a long, nearly naked, tail; fur brown above, with three transverse bright gray bands, interrupted in the middle, white below. It differs from the opossums in having webbed hind feet and being an expert swimmer and diver. Its habits closely resemble those of the otter, and it feeds on fish, crabs, and other aquatic animals.

Yapura, yā-poo-rā', or **Japura**, zhā-poo-rā', a river in Colombia and Brazil, South America, a tributary of the Amazon. It is about 1,800 miles long; and fully one half its course is navigable for steamers. At lat. 1° 10' S. and lon. 72° 20' W. navigation is interrupted by a large cataract.

Yard, (1) As a nautical term, a spar slung from a mast and serving to extend a sail. Yards are either square, lateen, or lug sail. Yards for square sails are suspended across the mast at right angles, and are of a cylindrical form, tapering from the middle, which is termed the slings, toward the extremities, which are called the yard arms. (2) A standard measure of length, equal to three feet or 36 inches, the foot in general being made practically the unit. As a cloth measure the yard is divided into four quarters = 16 nails. A square yard contains nine square feet, and a cubic yard 27 cubic feet. See WEIGHTS AND MEASURES.

Yarkand, yār-kānd', Central Asia, (1) A city of Eastern or Chinese Turkestan, situated on a fertile plain on the north side of, and at a little distance from the river Yarkand, about 200 miles southeast of Kashgar. It is enclosed by a ditch, and a thick mud wall with towers at intervals. The houses in general are built of sun-dried bricks. Those of the rich are in large open squares surrounded by high walls and well stocked with fruit-trees. The streets are in general too narrow to permit carts to pass. They are intersected by numerous canals, and where three or four streets meet there is always a tank for water. There is a large covered bazaar wide enough to admit carts. The inhabitants, like those of Kashgar, are very mixed in regard to race. The prevailing religion is Mohammedanism. There are 120 mosques and some caravanseries. During the period in which Eastern Turkestan was severed from China a commercial treaty was concluded at Yarkand in 1874 between Sir Douglas Forsyth, representing Great Britain, and Yakub Beg, who was then the independent ruler of Eastern Turkestan. Commercial intercourse with India sprung up in consequence. The chief trade at present is carried on with Russia. Estimated pop. 80,000 to 120,000. (2) A river of Eastern Turkestan, which rises in the Karakoram Mountains, flows generally in a northeast direction and unites with the Kashgar to form the Tarim. The Tarim flows east and enters the Lob Nor Lake, or series of shallow lakes.

Yarmouth, yār'müth, Canada, a town and port of entry of Yarmouth County, Nova Scotia; on the Bay of Fundy, the Atlantic Ocean, and the Dominion Atlantic Railroad; 90 miles south of St. John, N. B. The town has extensive fishing, shipping, and manufacturing interests, electric lighting, and street railways. At the head of its educational institutions is Yarmouth Seminary. Pop. (1901) 6,430.

YARMOUTH—YARROW

Yarmouth, Maine, town in Cumberland County; on Casco Bay, the Royals River, and on the Grand Trunk Railroad; 10 miles north-east of Portland. It contains four villages. It has a foundry, paper and cotton mills, and granite quarries. The town has six churches, North Yarmouth Academy, a high school, graded schools, and a public library. Pop. (1890) 2,098; (1900) 2,274.

Yarmouth, Great, England, a seaport town in the county of Norfolk, 22 miles east of Norwich, on a narrow slip of land between the Yare and the sea, and connected by a bridge over the Yare with Little Yarmouth, or South Town, in Suffolk. The older part, near the river, is remarkable for the number of narrow lanes at right angles to the main streets, known as the "rows." Between the older part of the town and the sea is the modern part, with a marine parade and other attractions. The parish church, founded in 1101, is a very large building, and the market-place is also of great size. There are a fine town-hall, a large custom-house, a fine library and museum, borough jail, a lofty Nelson monument, royal hospital, royal naval lunatic asylum, aquarium, two fine piers, and an ancient jetty. The quay stretches along the river upward of a mile. The harbor is in the Yare, and is accessible by vessels drawing 18 or 19 feet. Immediately off Yarmouth, and parallel to the shore, is a great range of sand-banks, between which and the land is the safe anchorage of Yarmouth Roads. Yarmouth is a great seat of the English herring-fishery, in which about 300 vessels and 3,000 hands belonging to the port are employed; many hands are likewise engaged in the mackerel fishery, and in that for cod and other whitefish. Many of the fish are cured, the cured herrings known as "Yarmouth bloaters" being celebrated. There are malting-houses, boat-building yards, rope-works, silk-crape factories, trawl-net works, etc. Yarmouth has risen into considerable importance as a watering-place. Pop. (1901) 51,250.

Yarn, any textile before woven into cloth. Cotton yarn is numbered according to the number of hanks contained in a pound of 7,000 grains. Each hank, or skein, measures 840 yards. Worsted yarn has 560 yards to the skein; woolen yarn has 1,600 yards to the skein or run. Linen yarn is wound upon reels, and made up into leas, hanks, and bundles. Flax and jute yarn is numbered according to the number of leas of 300 yards per pound.

Yaroslav, yā-rō-slāv', or Jaroslav, Russia, (1) a city, capital of the province of Yaroslav, at the confluence of the Kotorost and Volga rivers, 173 miles northeast of Moscow. It is the see of an archbishop. The Uspenskij Cathedral was begun in 1215, and there are numerous other old churches, several monasteries, schools, gymnasia, a theological seminary, and a lyceum with a law faculty. The left bank of the Volga is the suburban and residential portion of the city and contains many beautiful dwellings. The city is largely engaged in manufacturing and commerce, the right bank of the Volga being lined for two miles with quays. There are numerous cotton and linen mills, silk factories, and bell foundries. The village of Velikoje Selo, included in the city, is the centre of the linen manufacture of Russia, and has an annual output valued at \$3,000,000. Pop. (1897) 70,610.

(2) The province has an area of 13,751 square miles, and is bounded by the provinces of Novgorod, Vologda, Kostroma, Vladimir, and Tver. The surface is level and well watered by the Volga and its tributaries, the Mologa and Sheksma. The western portion has numerous ponds and marshes, the largest being Lake Nero, near Rostov, from which the Weska flows. The Volga is connected with the Neva by two canals, through which considerable commerce is carried on. Market gardening, timber cutting, mining, and manufacturing are the chief occupations. There are extensive linen and cotton mills, and factories for the manufacture of chemicals, machinery, metal ware, flour, tobacco, and spirits, making Yaroslav one of the principal manufacturing provinces of Russia. Considerable commerce is carried on by the two railway lines, the Rybinsk-Saint Petersburg and the Yaroslav-Moscow-Vologda. Pop. (1897) 1,072,478.

Yarra-Yarra, yā'ra-yā'ra, Australia, the river of Victoria on which Melbourne (q.v.) stands. It is about 100 miles long, but is not navigable above Melbourne, owing to its falls.

Yarrell, yār'el, William, English naturalist: b. London June 1784; d. Yarmouth, Norfolk, 1 Sept. 1856. Led to note carefully the habits of birds and fishes in 1825 he sent his first contribution to the 'Zoological Journal,' a notice of some rare British birds observed in the years 1823-5. The same year he became a member of the Linnæan Society, to whose 'Transactions' he repeatedly contributed interesting papers on the subject of birds, and in 1849 became its vice-president. His chief work is his 'History of British Birds' (1839-43, 4th revised edition 1881-5). He also published 'The History of British Fishes' (1835-6).

Yarrow, yār'ō, Harry Crécy, American physician: b. Philadelphia, Pa., 19 Nov. 1840. He was graduated from the medical department of the University of Pennsylvania in 1861, and during the Civil War served as surgeon of the 5th Pennsylvania cavalry. He was surgeon and naturalist in the expedition to explore the territory west of the 100th meridian, and has been acting assistant surgeon of the United States army for more than 30 years. He is the author of 'Introduction to the Study of Mortuary Customs Among North American Indians,' and various biological and ethnological monographs.

Yarrow, Scotland, a celebrated pastoral stream in Selkirkshire, which rises at Yarrow Cleugh, and, running east a few miles, forms a beautiful lake, called the Loch of the Lowes, which discharges its water into St. Mary's Loch. Issuing from the latter, the river, after a course of 16 miles through the district of Ettrick Forest, flows into the Ettrick near Selkirk. It is famous in Scottish song, and has been celebrated in poems by Scott, Wordsworth, and others.

Yarrow, an erect, hairy composite herb (*Achillea millefolium*), sometimes called milfoil. The terminal corymbs of small white, or occasionally rose-colored flowers, are large, compound, and fastigiata. The leaves are from two to four inches long, and are cut into numerous fine segments, which are very pubescent. Yarrow is a common plant of roadsides, and has been introduced from Europe. It has been used for a long time as a tonic and astringent, and

YARUMAL — YAWNING

enters into an ointment for dressing wounds. Several species of *Achillea* are garden plants. Sprigs of yarrow plucked from a young man's grave, by lovesick maidens, who repeat meantime a mystic formula, are expected to invoke the images of their lovers, in dream.

Yarumal, yā-roo-māl', Colombia, a town in the department of Antioquia, on the Cauca, 50 miles northeast of Medellín. Gold mining and stock-raising are the chief industries. Pop. est. 9,000.

Yataghan, yāt'a-gān, the Turkish name for a sort of dagger-like sabre with double-curved blade, about two feet long, the handle without a cross-guard, much worn in Moham-medan countries.

Yates, yāts, Edmund, English journalist and author: b. Edinburgh 3 July 1831; d. London 20 May 1894. After a secondary education he obtained a post in the secretary's department of the general post-office (1847), and in 1862 became head of the missing-letter department. Meanwhile he was also active in various literary work,—writing dramatic critiques for the 'Court Journal' and the *Daily News*, contributing to numerous periodicals, editing short-lived humorous journals ('Comic Times,' 'The Train'), and doing some successful farces. In 1858 he became editor of 'Town Talk,' in which he soon made an attack on Thackeray which resulted in his expulsion from the Garrick Club; in 1860 acting editor of 'Temple Bar,' of which he was editor-in-chief in 1863-7; and for a time was also editor of 'Tinsley's Magazine.' Among his subsequent ventures were 'Time: A Monthly Miscellany' (1879-84), and 'The World.' He lectured in the United States in 1872, and in that year withdrew from the post-office department. The best of his works in fiction are probably 'Broken to Harness' (1864), originally published in 'Temple Bar,' and 'Black Sheep' (1867). His 'Edmund Yates: His Recollections and Experiences' (1884; 4th ed. 1885) contains much interesting material.

Yates, Lorenzo Gordin, American naturalist: b. England 8 Jan. 1837. He came to the United States in 1853, and after teaching in Wisconsin, he later studied medicine and dentistry. He served in the geological survey of California under Prof. J. D. Whitney (q.v.), and had charge of the scientific department of the Froebel Institute, Los Angeles, Cal. He has published 'California Digest of Masonic Law' (1867); 'Charm Stones' (1886); 'The Ferns of Ceylon' (1887); 'Notes on Hawaiian Ferns' (1887); 'The Channel Islands' (1890); 'The Mollusca of Santa Barbara County and New Shells from the Santa Barbara Channel' (1890); 'All Known Ferns'; 'Aboriginal Weapons of California' (1900); 'Prehistoric California' (1903).

Yates, Richard, American politician: b. Warsaw, Ky., 18 Jan. 1818; d. St. Louis, Mo., 27 Nov. 1873. He was graduated at Illinois College, Jacksonville, in 1838; practised law at Springfield, Ill., sat in the State legislature 1842-9, and was sent to Congress as a Whig in 1850. In 1860 and 1862 he was governor of Illinois. He was a strong opponent of slavery, and an ardent supporter of the government during the Civil War, taking an active part in the organization of volunteer regiments. He

was United States Senator in 1865-71, and afterward United States railroad commissioner.

Yates, Richard, American politician, son of the preceding: b. Jacksonville, Ill., 12 Dec. 1860. He was graduated from Illinois College in 1880 and from the law department of the University of Michigan in 1884. After being city attorney of his native place, 1885-91, he was county judge of Morgan County, Ill., 1894-7, and collector of internal revenue at Springfield, Ill., 1897-1900. In 1901 he was elected governor on the Republican ticket of Illinois for the term ending 1905.

Yates, Robert, American statesman and jurist: b. Schenectady, N. Y., 17 March 1738; d. Albany 9 Sept. 1801. He was educated and studied law in New York, and after his admission to the bar (1760) settled in Albany, where at the commencement of the Revolutionary troubles he was a member of the committee of public safety (1775). In 1775-7 a member of the provincial congress of New York. He was a member of the convention that framed the constitution of the State (1776), in 1777 was appointed judge of the supreme court of New York, and in 1787 was a member of the convention that framed the Constitution of the United States. His notes of the secret proceedings and debates of this convention were printed after his death (1839). In 1790 he was appointed chief justice of the State of New York. On his retirement from the bench in 1798 he was appointed a commissioner to settle disputed titles to lands in the 'Military Tract' with Massachusetts and Connecticut.

Yates, William, English Baptist missionary: b. Loughborough, Leicestershire, 15 Dec. 1792; d. at sea 3 July 1845. He studied for the Baptist ministry at Bristol College, was ordained in 1814, and sailed for Calcutta the next year. He settled at Serampore, preaching for a time and subsequently devoted himself entirely to translation. He translated the whole Bible into Bengalee; the New Testament, the Pentateuch, Job, the Psalms, the Proverbs, the Song of Solomon, Ecclesiastes, Isaiah, and Daniel into Sanskrit; and the New Testament into Hindee and Hindustanee. He also prepared in Sanskrit a dictionary, grammar, vocabulary, several school books, and an expurgated edition of the 'Hitopadesa' and 'Nalodaya,' numerous school books in Hindee, Hindustanee, Arabic, and Bengalee; and translations of Bunyan's 'Pilgrim's Progress' and Baxter's 'Call to the Unconverted.'

Yates Centre, Kan., city, county-seat of Woodson County; on the Missouri Pacific and the Atchison, T. & S. F. R.R.'s; about 90 miles east by north of Wichita. It is in a productive farming region. It has industries connected with farm and dairy products, stock-raising, and marketing of wheat, corn, and fruit. There are six churches, a high school, graded elementary schools, and a school library. It has two banks, one national and one state. Pop. (1890) 1,305; (1900) 1,634.

Yawl, a small ship's boat, usually rowed by four or six oars; a jolly-boat; also a sailing boat similar to a cutter, but having a small sail at the stern.

Yawning, or **Gaping**, an involuntary and wide opening of the mouth and inhalation of

YAWS—YAZOO CITY, MILITARY OPERATIONS

breath, generally produced by weariness or an inclination to sleep, sometimes by hunger, sympathy, etc. It often precedes the fit in some intermittent fevers, hysteria, and spasmodic asthma, and in some instances, by the frequency of its recurrence, becomes a real disease. Persons suffering from heart disease may be liable to yawning fits. It is supposed by some to be determined by an interruption of the pulmonary circulation. Yawning is performed by expanding the chest, by extending the lungs, by drawing in, gradually and slowly, a large quantity of air, and gradually and slowly expiring it after it has been retained for some time, the muscles of the chest being restored to their natural state. Its effect upon the muscles brought into play is sometimes very restful. When yawning is troublesome, long, deep respiration, or drawing in the air at long intervals, relieves it. It often seems "contagious."

Yaws, a disease occurring in Africa, America, Samoa, Java, and tropical regions in many parts of the world. It is almost wholly confined to the African races. It is characterized by cutaneous yellowish tumors, numerous and successive, gradually increasing from specks to the size of a raspberry, one at length growing larger than the rest; core a fungous excrescence; fever slight, and probably irritative merely. It is contagious, and cannot be communicated except by the actual contact of yaw matter to same abraded surface, or by inoculation, which is sometimes effected by flies. It is also called *frambesia*, from the French *framboise*, a raspberry. Some regard it as a form of syphilis.

Yazd, *yāzd*. See **YEZD**.

Yazoo, *yā'zoo* (an Indian word meaning "River of Death"), a river in Mississippi, formed by the junction of the Yallobusha, Tallahatchie, and several bayous thrown out by the Mississippi River in the northwestern part of the State. Its general direction is southwest; it is a deep, sluggish stream; the total course of nearly 300 miles, and is very irregular. It enters the Mississippi about 11 miles above Vicksburg. It is navigable all the year. The Tallahatchie River receives part of its waters from the Mississippi; so that small boats from the Mississippi can enter the Yazoo at its source and re-enter the Mississippi not far from Vicksburg.

Yazoo City, Miss., city, county-seat of Yazoo; on the Yazoo River, and on the Yazoo & Mississippi Valley (Illinois Central) Railroad; about 44 miles northwest of Jackson and 60 miles northeast of Vicksburg. It is in a fertile agricultural region in which the chief products are cotton, farm products, and lumber. The chief industrial establishments are cotton factory, lumber mill, cottonseed-oil mills, cotton gins, cotton compresses, machine shops, and brick, lumber, ice, and coal yards. The principal public buildings are the county courthouse, opera house, and library. There are five church buildings valued at \$100,000, and eight churches, for colored persons, valued at \$40,000. The educational institutions are Saint Clara's Academy (R. C.), and public schools for both races. The three banks have a combined capital of \$300,000; and the annual business amounts to \$3,500,000. The government is vested in a mayor and a council of eight members, four of

whom are elected each year. Yazoo City was settled about 1820. In 1830 it was incorporated, and in 1840 chartered as a city. In 1904 the city suffered heavily from fire; practically all the business portion was destroyed; every one of the five churches, the city-hall and Masonic Hall were also burned; the loss was estimated between \$1,000,000 and \$2,000,000. Pop. (1890) 3,286; (1900) 4,944.

J. G. MCGUIRE,
Editor 'Yazoo City Herald.'

Yazoo City, Military Operations at and near. Yazoo City was chosen by the Confederates as a site for a navy yard, at which were constructed some formidable iron-clads. Upon Gen. Grant's approach to Vicksburg from the rear, in May 1863, the Confederates abandoned Haynes' Bluff, near the mouth of Yazoo River, upon which Lieut.-Commander John G. Walker, of the United States navy, went up the river with a small gunboat fleet to destroy all the works at Yazoo City. As the expedition approached the city, Lieut. Isaac N. Brown, of the Confederate navy, set fire to and destroyed three powerful rams which he had nearly completed, and upon which the Confederates were placing great reliance. Walker set fire to everything else of a public character, including the navy yard, containing five saw-mills, planing-mills, machine-shops, etc., and the expedition then returned. Early in June, Kimball's Union division was sent up the Yazoo to destroy the railroad bridge over the Big Black near Canton; but upon arriving at Mechanicsburg Kimball found a large Confederate force in his front at Yazoo City and Liverpool, and as the river, on which he depended for supplies, was rapidly falling, he returned to Haynes' Bluff. After the surrender of Vicksburg a report reached Gen. Grant that Gen. J. E. Johnston was fortifying Yazoo City, and that a number of steamers were at the place, employed in supplying his troops. A naval and military expedition was organized to capture or destroy the steamers and take the place. Four vessels, under Lieut.-Commander Walker, and 5,000 men under Gen. F. J. Herron, in transports, went up the Yazoo from Haynes' Bluff 12 July, and approached Yazoo City at noon next day; the Confederates were reported in force, and the iron-clad gunboat *De Kalb* was pushed ahead and opened her guns to ascertain the number and position of the enemy's guns. The Confederates had a battery of six heavy guns and the town was held by the 29th North Carolina infantry. Finding the defenses formidable, Walker dropped back and notified Herron, who at once landed his troops and a combined attack was made. After a slight skirmish on shore the Confederates fled, previously setting fire to four large steamers. Six heavy guns and one steamer fell into Union hands. Herron captured nearly 300 prisoners. While the *De Kalb* was moving slowly along and firing on the enemy, she ran on a torpedo, and sank in 15 minutes. All on board were saved. Herron destroyed all public property, captured about 2,000 bales of cotton, and returned to Vicksburg on the 21st.

On 3 Feb. 1864, in co-operation with Gen. Sherman's Meridian expedition (q.v.), a combined expedition of gunboats and transports with troops was sent up the Yazoo River from Vicksburg, with instructions for the gunboats to explore Yazoo and Sunflower rivers and all

YAZOO FRAUD—YAZOO PASS EXPEDITIONS

their tributaries. The gunboats were five in number, under command of Lieut.-Commander Owen, United States navy. Five transports conveyed the 11th Illinois and 8th Louisiana (colored) infantry and 35 colored cavalry, in all 982 men, under command of Col. James H. Coates, who was instructed to reconnoitre above Yazoo City and to obtain corn and forage on the Sunflower or on the Yazoo, and also to seize at least 1,000 bales of cotton and to destroy all flats or boats used to cross from the east to the west. From its start the expedition was annoyed by Gen. L. S. Ross, who, with a brigade of about 1,200 men, was guarding the Yazoo River and the Mississippi Central railroad, and who, on the 3d, opened fire with artillery upon one of the gunboats when near Liverpool Heights. Coates landed his men, had an indecisive fight with Ross in which he lost 6 killed, 21 wounded, and 8 missing, and at night withdrew to his transports. Next morning the expedition, under fire of Ross' artillery and musketry, passed up the river, the gunboats clearing the way to within four miles of Yazoo City, where it remained until the 6th, when two gunboats, having been ordered to reconnoitre, reported that the place was occupied in force, with five guns in position and another in course of erection. The guns opened, two shots taking effect on one of the gunboats, and the gunboats and transports fell down the river below Sataria, where, on the morning of the 7th, Coates disembarked his entire command, drove back some Confederate skirmishers, and at night withdrew to his transports. On the 8th the expedition again pushed up the river, two gunboats passed the city and the transports landed their men within a mile of it. Next day Coates took possession of the city, and on the 11th moved up the river, arriving at Greenwood on the 14th, where he remained until the 19th, gathering cotton, corn, and forage. He then received orders to fall back to Yazoo City. On the 28th when within six miles of the place he ordered his small force of cavalry to move in rear of the city and take possession of all roads leading out of it. That afternoon he landed at Yazoo City and took position in some redoubts commanding the roads. Major Cook, with 50 colored cavalry, was sent toward Benton. When nearly six miles out Cook ran into Ross' brigade, by which he was roughly handled and pursued nearly to the city, losing 8 killed, 35 wounded, and 10 missing. Coates' pickets were much annoyed and on the morning of 5 March were driven in. Ross had been joined by Gen. R. V. Richardson's Tennessee brigade of about 600 men, and at 10 o'clock the two brigades, about 1,600 men, making a determined attack, forced portions of the Union line and gained the streets of the town. At the same time they used artillery upon the redoubt, on the Benton road beyond the town, which, with the adjacent rifle-pits, was held by a part of Coates' command and repulsed all Confederate effort to carry. At 2 P.M. Coates, with those who were not in the redoubt, made a charge through the streets and the Confederates withdrew and gave up the attempt upon the redoubt. The Union loss in the engagement was 19 killed, 80 wounded, and 18 missing. The Confederate loss was 6 killed and 51 wounded. On the evening of

the 6th Coates started on his return to Vicksburg. He took with him over 1,700 bales of cotton, and much corn and forage. The total loss of the expedition was 31 killed, 121 wounded, and 31 missing.

On 19 April 1864 a small detachment of a colored brigade, under command of Col. H. Scofield marched from Vicksburg for Yazoo City and two gunboats went up the river to co-operate in an attack on the city. Scofield skirmished sharply with a part of Gen. Wirt Adams' brigade and on the night of the 20th bivouacked 15 miles below the city. On the 22d the gunboat Petrel in attempting to run past Yazoo City, in order to fire upon the works from above, was fired upon by a section of artillery and a detachment of sharpshooters of Adams' brigade. The men were driven from the guns, the crew from the boat, and most of them captured, including Acting Master McElroy. The Confederates seized the boat, removed her eight guns, and burned her. Next morning the expedition returned to Vicksburg.

E. A. CARMAN.

Yazoo Fraud, The, a name given to the sale of lands in the western part of Georgia by a corrupt legislature, to certain large companies in 1789. This action caused great excitement and bitter controversy until settled by the United States Supreme Court in 1810. See **GEORGIA**.

Yazoo Pass and Steele's Bayou Expeditions. In the Civil War after the battle of Chickasaw Bayou, 29 Dec. 1862, and the capture of Arkansas Post, 11 Jan. 1863, Gen. Grant ordered the army to Young's Point and Millikin's Bend, where he took command in person 30 January. Work on the projected canal across the peninsula opposite Vicksburg was pushed, but on 4 February Grant questioned its success, and began to look for other routes by which the army could reach the high ground either north or south of Vicksburg. Two projects were considered. One involved cutting away from the Mississippi into Lake Providence from a point 70 miles above Vicksburg. This lake, a former bed of the river, was connected by Bayou Baxter with Bayou Macon, a navigable stream, which led to the Tensas, thence into the Washita, and finally into the Red River. Thus it was hoped the army could be transported to the lower Mississippi to co-operate with Banks against Port Hudson. It is 470 miles by the main river from Lake Providence to the mouth of Red River, and much farther by the winding bayous. Upon the cutting of the levee at Lake Providence the water from the river flowed in rapidly and the six miles of the lake beyond were soon available. But Bayou Baxter was found choked for miles with fallen trees and a thick growth of timber overhanging it. Gen. McPherson's entire corps was engaged for some time in attempting to open this channel and those below it. In March this project was abandoned.

On the east side of the river, a few miles below Helena, was Yazoo Pass. This had formed the old route of river steamers through the Coldwater to the Tallahatchie, and the Yal-labusha to Yazoo City, but it had been closed for some years by a strong levee. By reopening this route it was believed to be possible to reach the high ground on the Yazoo bluffs north of Vicksburg. This Yazoo Pass plan promised

greater success than the Lake Providence scheme. Under Lieut.-Col. Wilson of the engineers, later Maj.-Gen. James H. Wilson, the levee was cut 4 February, a way was cleared to the Coldwater, and the Pass opened to navigation on the 24th. Brig.-Gen. Ross, with 4,500 men, was ordered into the pass upon light draft transports, and, preceded by gunboats, penetrated by that stream to the Tallahatchie, and thence to the Yallabusha, where the expedition, after an advance of 225 miles, was stopped 10 March by Fort Pemberton, near the juncture of the last named streams. It was a strong work in a bend which commanded both. The fort was found to be so situated that in this time of high water neither troops nor gunboats could reduce it. As it stood only a few feet above the water, attempts were made to flood it by cutting the levee at Austin above Helena, and widening the cut into Yazoo Pass. These were unsuccessful. The expedition, after several attempts on the fort, withdrew. On the way back a reinforcement under Gen. Quimby was met, and this officer ordered a return to Fort Pemberton for further efforts. He soon became satisfied that the fort could not be reached, and ordered final withdrawal. The gunboats could not turn in the narrow channels and were forced to back out over a large part of the route. Gen. McPherson's corps had been ordered into the pass, but was delayed for lack of light draft transports, and later the intended movement of the army by that route was abandoned. Meantime the Confederates had gathered a strong land force under W. W. Loring, which became first harassing and soon after most threatening. Sherman, preceded by five gunboats of Admiral Porter's fleet, was despatched in haste through Steele's Bayou, by which route it was hoped he could reach the Yazoo, relieve Ross, then supposed to be in danger of capture, and at the same time find a practical way for the army into the Yazoo. Sherman had a winding and difficult route of 150 miles before he could reach that stream. From Steele's Bayou, which he entered at Eagle Bend, he passed to Black Bayou, and thence to Deer Creek. This opened into Rolling Fork by which he could enter the Big Sunflower, and by this stream reach the Yazoo. Even with the tremendous energy of his advance Sherman was barely in time to save the gunboats which had been attacked in Deer Creek by land forces, and were so hard pressed that Admiral Porter was considering the blowing up of his fleet and retreating with his crews through the swamps. These several attempts through the bayous east and west of the river had been carried on over hundreds of miles and against the most formidable obstacles of flooded country, dense forests, and heavily obstructed streams. They were finally abandoned, and the army reassembled at Millikin's Bend and Young's Point. From this position the army subsequently moved in the final campaign against Vicksburg.

H. V. BOYNTON.

Year, the period in which the revolution of the earth round the sun, and the accompanying changes in the order of nature, are completed. The accurate determination of the length of the year, which required great knowledge of astronomy and exact observations, could only be reached by the successive efforts of many generations. On this subject see CAL-

ENDAR. There are years of various lengths, according to the principle adopted in measuring them. The sidereal year is the interval that elapses while the sun moves from a star to the same star again (of course this motion is only apparent), a period the length of which is slightly affected by nutation (which see), but on the average is equal to 365 days, 6 hours, 9 minutes, 9.6 seconds. The tropical or civil year, sometimes called the solar year, is the time in which the sun moves from the vernal equinox to the vernal equinox again; its mean length is 365 days, 5 hours, 48 minutes, 49.7 seconds. This is the year as commonly understood. On account of the precession of the equinoxes it is rather shorter than the true period of the earth's revolution. (See PRECESSION.) A lunar year is the time required for 12 revolutions of the moon, which is 354 days, 8 hours, 48 minutes, 37 seconds. See also DAY; SIDEREAL TIME; SOLAR TIME.

Year and a Day, a period of time fixed upon by ancient statutes and common law, which must elapse between the occurrence of some event before the legal right connected therewith could be either lost or gained. A full year was intended by the expression.

Year Book, law reports of cases and decisions in England, issued annually by the scribes or clerks of the courts, from the time of Edward II. to that of Henry VIII. The name is now given to books sent out at the beginning of each year by cities, States, or countries, or by newspaper and other publishers, and which include, besides an almanac, the agricultural, political, scientific, and educational statistics and chief items of interest of the preceding year. See ALMANAC.

Yeardley, yērd'li, or **Yardley**, SIR GEORGE, American colonial governor: b. England about 1580; d. 1627. After seeing service in the Netherlands he came to America in command of Sir Thomas Gates' expedition. This was wrecked at the Bermuda Islands, but he reached Virginia in 1610 and was acting governor of the Virginia colony 1616-17. Returning to England the next year he was there knighted and chosen deputy governor of the colony, filling the office 1619-21, and again from 1626 till his death. By his instructions was summoned the first legislative assembly ever gathered in America, the House of Burgesses.

Yeast is a micro-organism of the vegetable kingdom and belongs in the order of the *Gymnoascea* to the family of the *Saccharomycetes*, of which there are three classes, namely, *Monospora*, *Saccharomyces* and *Schizosaccharomyces*. The main characteristic of the first class, as its name indicates, is that it only develops one spore in the ascus. Thus far only one type, the *Monospora Cuspidata*, which is parasitic in *daphniada* which it destroys, has been determined. There are many representatives of the second class, while only a few of the third have up to the present time been identified. The second class,—the *Saccharomyces*—is generally what is understood under the term yeast, not only in the brewery but also in the distillery and the compressed yeast fabrication. Its structure is very simple; it consists of a single cell, which has few distinguishing characteristics. Each cell of the *saccharomycetes* is more or less globular or ovoid in form and, just

YEAST

as every other vegetable cell, consists of a colorless, viscous substance (protoplasm), a cell-wall (membrane), and also a nucleus. In the protoplasm there are observed, according to the species of the plant cell, different numbers of spaces filled with cell-juice, which are termed vacuoles.

In young yeast cells the cell-wall, or membrane, is very thin—0.4 to 0.9 μ —and has almost the same refractive power as the protoplasm which it surrounds. The membrane is thickened through external influences, especially then when the yeast-cells must develop in or upon a highly nutritious medium. An increase in the thickness of the cell-wall is also accompanied by greater impermeability and a corresponding decrease in the fermentative capability of the cell. Through the action of acids or alkalies upon the yeast cell the layers of the cell-wall can be shown, which are two, and sometimes three, or even more in number. Chemically the membrane of the yeast cell consists of cellulose (erythro and achroo-cellulose), pectinic compounds, and plasmatic components, for which reason it is very nitrogenous. The cell contents consists of protoplasm with more or less glycogen. (According to Laurent there is 32.28 per cent glycogen in the dry substance.) In the young yeast cell the whole interior is filled with protoplasm, in a short while, however, apparently hollow spaces appear, which are filled with the reserve nourishment necessary for the vitality of the cells. The nucleus furnishes the substances necessary for building up the cell, and, according to its chemical composition, belongs to the albuminoids in the class of the *proteids*, and especially to the nucleins. The form of the nucleus varies considerably; in a young cell it is spheroid, flattens out with increasing age to a disk whose periphery is no longer entire, but is lobed; elliptical shapes were also found.

The nucleus is in some instances of a considerable size; its diameter in some cases being one third of that of the cell. Concerning the inner structure of the nucleus it was observed that the nucleus of the yeast cell has a pellicle as well as a nucleolus, which is spheroid, and is situated in approximately the centre of the nucleus, the space between the pellicle and the nucleolus being filled with nucleus plasma (Karyoplasma), this having a netlike structure through which the nucleolus is suspended. One or more vacuoles were observed in several types of yeast in the Karyoplasma under certain conditions, especially then when the cells were transferred into fresh nutrient solutions. With the beginning of the propagation of the cell a corresponding development of the nucleus takes place, in either one of two ways, that is, the direct division (Amitosis), or the indirect division (Karyokinesis, Mitosis). The manner in which the nucleus divides itself differs in the various types of yeast. The yeast cell is propagated in one of two ways, either through exogen spore formation, budding, or through endogen spore formation, the real sporulation.

In the former case a new cell is detached from the parent cell, while in the latter the new cells (spores) are formed inside the parent cell, which it leaves only upon complete maturity. Several recent investigators are inclined to believe in the sexuality of yeast, and close research

with various yeasts, as *Sacch. farinosus*, *Sacch. Bailii*, etc., has been made.

Two types of yeasts have in the course of time become culture plants in the real sense of the word, through intentional continuous cultivation for certain definite purposes. These types are (1) that known as the bottom yeast in the manufacture of beer, and (2) that which is the cause of the fermentation of the top-fermented beers and of the whiskey mash. The former is so called because it settles in a thick, creamy layer upon the bottom of the fermenting vat during the slow fermentation of lager-beers in temperatures of 40° to 50° F. (4.5° to 10° C.), while the latter is termed top yeast because in the more rapid fermentation at 54° to 65° F. (12° to 18° C.) (ale, weissbeer, etc.), it is separated as a yellowish brown foam, which is forced to the surface by the escaping carbonic acid gas. It is the last named species which furnishes almost exclusively the material for the manufacture of that product known as compressed yeast.

As has been said, there are a number of independent species of yeast, which vary not only according to form and size of the cell, but also according to the composition of the nutrient medium in which they live, hence according to chemical and physical properties. Yeast flourishes luxuriantly only then when it finds not only qualitatively but also quantitatively, in the nutrient medium all the substances necessary for its nutrition. The brewer, distiller, etc., therefore endeavors to produce as vigorous a yeast as possible, in order to be enabled to conduct the fermentation in the manner best suiting his purposes. For such normal nourishment, it is essential that diverse substances are at its disposal.

Yeast thrives well when, besides water, carbon in the form of sugar, nitrogen in albuminous compounds or ammoniacal salts and various mineral components, especially sulphate of magnesia and potassium phosphate, are at its disposal. If the necessary nutriment is lacking the vitality of the yeast cell may rest, but the cell does not perish.

Various analytical data are at hand in regard to the composition of the yeast. Dumas found that the yeast contains:

	Per cent
Carbon	50.6
Hydrogen	7.3
Nitrogen	15.0
Oxygen, sulphur, and phosphor.....	27.1

Mitscherlich found top yeast of the following composition:

	Per cent
Carbon	47.0
Hydrogen	6.6
Nitrogen	10.0
Sulphur	0.6
Oxygen	35.8

The differences found between bottom and top yeasts have been very slight. Wagner experimented upon top and bottom yeasts and obtained the following averages:

	Top yeast per cent	Bottom yeast per cent
Carbon	49.8	48.4
Hydrogen	6.8	6.0
Nitrogen	9.2	9.2
Sulphur + oxygen	34.2	35.8

A yeast may have all the necessary organic substances in the proper form and amount, yet

YEAST

it will not flourish if the salts are lacking. The yeast in this case is the same as any other plant organism, which must perish if it is deprived of its mineral nourishment. Hence a knowledge of the requirements of mineral substances for a yeast is of utmost importance, and many examinations were made to secure data on this point. Mitscherlich found in the ash of

	Top yeast per cent	Bottom yeast per cent
Phosphoric acid	53.9	59.9
Potash	39.8	28.3
Soda + magnesia	6.0	6.0
Calcium oxide	1.0	1.0
Silica	traces	0.0

The most essential substances which the yeast requires for its sustenance are, accordingly, phosphate of potassium and phosphate of magnesia. The above data are from elementary analyses. Naegeli later instituted investigations which should show the amount of the various combinations, which are observed in a yeast. According to his observations the yeast, when treated with water until its soluble components are absorbed, gives up to the water 37 per cent of the total weight of the dried yeast. The bodies thus brought in solution consist of compounds closely related to vegetable slime. The amount of moisture in a yeast is exceptionally large, for if it is completely dried it loses 83 per cent of its weight, so that in 100 parts of yeast only 17 parts are solid components. The mucous part of the yeast cell, the protoplasm, contains more water than the membrane which surrounds it, and consists chiefly of albuminoids, and about 2 per cent of peptone. Accordingly the composition of the yeast with 8 per cent nitrogen is:

	Per cent
Cellulose and vegetable slime	37
Common albumin	36
Easily converted glutine (casein protein)	9
Peptones (precipitable by lead acetate)	2
Fat	5
Ash	7
Extractive substances	4

According to E. C. Hansen of Copenhagen, yeast is divided into two groups, the real *Saccharomycetes*, which are capable of forming endospores, and the non-saccharomycetes, which never form spores. He subdivides the former into such which separate out sucrose and engender alcoholic fermentation, that is, which vigorously ferment saccharose, dextrose and maltose, as brewer's yeast; and such which ferment saccharose, dextrose, levulose but not maltose, as, for example, *Saccharomyces Ludwigii*; *Sacch. exiguus*, and into such which do not separate out sucrose and do not excite alcoholic fermentation, as *Saccharomyces membranaefaciens*.

The non-saccharomycetes Hansen divides into 3 groups; such which ferment solutions of dextrose and invert sugar, as *S. Rouxii*, *S. apiculatus*; such which separate out no sucrose but ferment saccharose, maltose and dextrose, as *Monilia candida*, and finally such which ferment saccharose, glycose, galactose and lactose, the lactose yeasts. In practice the division into culture and wild yeasts would be appropriate. The yeasts can also be safely divided according to their power of attenuation, that is, the decrease in the density of the nutrient medium due to fermentation. The attenuation reached by a yeast in a diastase-free beer wort has been

agreed upon as the limit, and in accordance therewith the brewers' yeasts are graded, and we have the Froberg type with high attenuation, and the Saaz with low attenuation. Van Laer has defined a new type, Logos, so that now we have the types Saaz-Froberg, and Froberg-Logos, with all intermediate grades. The numerous wine yeasts vary according to their resistibility against heat and acids; the amounts of sugar produced by them, and the amount of fruitesters, which they impart to the liquid. The distillers' yeasts, mostly top yeasts, are known by their resistance against acids, and foreign ferments, through their fermentative capability and the amount of alcohol developed.

No one can deny that yeast induces alcoholic fermentation, but how this is accomplished is still a matter of controversy. Liebig and other chemists maintain that fermentation is called forth by a ferment contained in the yeast cell, while Pasteur deems it the necessary consequence of life without oxygen. Naegeli claims it to be a transferring of the motion of molecules of protoplasm of the yeast to the fermenting liquid. Eduard Buchner and Rudolf Rapp of Munich discovered in the yeast cell a fermentation-inciting enzyme—zymase—which, however, can only induce fermentation once after the cell is completely destroyed. This discovery, which is of much scientific import, has not yet been made applicable in practical arts.

Besides the culture yeasts, there are a number of wild yeasts, which can produce great disturbances in the liquids infected by them. In order to avoid such infection by wild yeasts and also by bacteria, Hansen experimented and succeeded in preparing a pure yeast culture, that is, a culture originating from a single cell. Such a culture is not only free from all wild yeasts and bacteria, but also can and does remain unchanged as all cells are of the same nature. A reliable fermentation process can only be obtained by the use of one single type.

Such pure cultures are variously prepared; the oldest and best known method is that of Hansen, which has recently been modified by Dr. Lindner of Berlin as the droplet-culture. Both investigators employ for the further development of the young vigorous cultures the propagation apparatus, which when once supplied with an absolute pure culture can be used for a long time if proper care is observed. Upon this pure culture method a new brewing process is based which permits of entirely sterile work from boiling the beer to the putting it on the market. This process, invented by Nathan, has been called by him in honor of Hansen, the senior in the art of pure culture, the Hansena process. Another method to obtain yeast of a high degree of purity is that in which a mixture of yeast is exposed to definite conditions of temperature, aeration, kind of nutrition, action of light, pressure and motion that one yeast of definite properties develops more and better than the other yeasts in the mixture. If, further, the corresponding layer is removed from the yeast and propagated under the aforesaid conditions, a pure yeast of a uniform character is finally obtained. This process, founded by Delbrueck of Berlin upon his scientific observations in American breweries, was further elaborated by him. An idea of the importance and value of pure yeast culture can be had from the

YEATES — YELLOW BAYOU, ENGAGEMENT AT

fact that almost all the larger breweries and distilleries employ apparatus for propagation and endeavor through observing the utmost care to protect their yeast against infection. But yeast is not only of great import to the brewer and distiller, but also to the baker, as the quality of his wares depends upon the quality of the yeast used, and in consequence thereof a special industry, that is, the manufacture of compressed yeast, has been introduced. Compressed yeast is chiefly made from distillers' yeasts; but in some instances also, beer yeasts, which must be purified and disemibittered, are utilized. The price of compressed yeast in comparison to beer yeast, is considerably high, but the baker has the advantage that by using the former his wares obtain a larger size than when the latter is used. The process of fermentation with compressed yeast develops more slowly than with beer yeast, hence the dough requires more time to ripen. Much progress has been made in the compressed yeast fabrication and diverse methods are employed in its manufacture. Many operations must be carefully and accurately observed in order to obtain a salable product. In the main these operations are: (1) Preparation of a fluid in which the yeast can properly develop, either under simultaneous formation of alcohol or without the formation of much alcohol; (2) preparation of a mass, in which there is a corresponding amount of vigorous seed-yeast, which is added to the above mentioned fluid (preparation of the mother-yeast); (3) bringing together of the nutrient medium with the stock yeast or "settling"; (4) reproduction of the yeast with or without simultaneous fermentation; (5) separation of the newly formed yeast from the fluid by skimming, etc.; (6) washing the yeast, or removing the last traces of the nutrient medium; (7) pressing of the washed and separated yeast mass; (8) forming the compressed yeast into cakes of suitable size; (9) packing of the cakes for the trade and for shipping.

For some time yeast, especially beer yeast, has been used in medicine, and has been successfully employed partly fresh and partly dried, in tablet form in cases of furunculosis, flemoneu, acne, psoriasis, and other skin diseases, dyspepsia and partly in diabetes.

MAX VON KUENSBERG, PH.D.,
Of the Industrial Chemical Institute of Milwaukee.

Yeates, yêts, **William Smith**, American geologist: b. Murfreesboro, N. C., 15 Dec. 1856. Graduated from Emory and Henry College (Emory, Va.) in 1878, he was connected with the United States Fish Commission in 1879 and 1880-1, and in 1881-93 was successively assistant, acting curator, and assistant curator of the United States National Museum, in charge of the minerals and gems. He was professor of mineralogy in the Corcoran Scientific School of Columbian University (Washington, D. C.) in 1884-93, professor of geology in 1890-3. In 1893 he was appointed State geologist of Georgia.

Yeats, **William Butler**, Irish author: b. Dublin 13 June 1865. He obtained a secondary schooling in England and Ireland, was for three years a student of art, but turned to literature in 1886. He was a leader in the foundation of the Irish Literary Society and the National Literary Society of Dublin, and a prime mover

in the Irish Independent Theatre, thus becoming one of the chief representatives of the so-called Celtic revival. In 1903-4 he lectured in the United States on subjects connected with this movement. With E. J. Ellis he edited 'The Works of William Blake' (1893) and 'Ideas of Good and Evil' (1903). Among his various further publications in prose and verse are: 'The Wanderings of Oisín' (1889); 'John Sherman' (1891); 'The Celtic Twilight' (1893); 'A Book of Irish Verse' (1895); 'Poems' (1895); 'The Wind among the Reeds' (1899); 'The Shadowy Waters' (1900); and 'Cathleen ni Hoolihan' (1902).

Yellow, one of the prismatic colors; the color of that part of the solar spectrum situated between the orange and the green; a bright golden color, the type of which may be found in the field buttercup, which is a pure yellow. United with blue it yields green; with red it produces orange.

Yellow-bass, **Perch**, etc. See BASS, PERCH, etc.

Yellow Bayou, Engagement at, and Banks' Retreat from Alexandria. Gen. Banks arrived at Alexandria, La., on his retreat from Sabine Cross Roads (q.v.), 25 April 1864. Three days later Gen. Hunter handed him an order from Gen. Grant to close up the campaign against Shreveport without delay and return A. J. Smith's troops to Gen. Sherman, for operations east of the Mississippi. Hunter returned with a letter from Banks to Grant with the information that Porter's fleet was above the Alexandria Rapids in a critical situation should the army abandon it. As to the further prosecution of the Shreveport and Texas campaign, that was not to be thought of, and Banks turned his attention to getting Porter's fleet below the rapids. These falls were a mile in length, filled with rugged rocks, which at the time were nearly bare. As the vessels needed at least seven feet of water to float them, they seemed to be doomed. The plans for their release were suggested and executed by Lieut.-Col. Joseph Bailey of the Fourth Wisconsin Cavalry. The work began on 30 April, nearly the entire army at different times, being detailed for the duty; 2,000 to 3,000 lumbermen from Maine and the Northwest cut down trees; others were set to collecting stones, brick, etc., including whole houses and sugar-mills with all their machinery and kettles, and in a week a dam of timber and stone, with sunken barges in the centre, had been constructed across the river, 758 feet in width, raising the water from 5 to 6 feet deep on the rapids. The work had been prosecuted day and night, the men working up to their waists and exposed to a hot sun. The water having risen, three gunboats and another vessel ran down the rapids on the afternoon of 8 May and lay to just above the dam. Early in the morning of the 9th two of the barges broke loose, making a gap in the dam 66 feet wide, through which the water rushed in a great torrent, and the four vessels went down safely through the opening. Six gunboats and two

YELLOW BOOK OF FRANCE—YELLOW FEVER

tugs were still above the rapids, waiting for a higher rise in the water. The damage to the dam was partially repaired and wing-dams were constructed on the upper falls, which shed the water from either side into the channel between them. They were completed by the 11th, when the water had risen to 6½ feet. Meanwhile the heavier vessels had been lightened by stripping from them their armor-plates and landing some of the heavy guns, ammunition, chain cables, anchors, and provisions, and on the 12th all the vessels had run down the falls and through the dam into deeper water. Meanwhile the Confederates had gotten in Banks' front, south of Alexandria, and taken position on the river 25 miles below the town, where 1 May they captured and sunk a transport, and on the morning of the 3d captured a transport, on her way up the river with 425 men of the One Hundred and Twentieth Ohio on board. Some of the men were killed and wounded, all the officers and 270 men were captured. On the evening of the 4th another transport carrying 400 men of the Fifty-sixth Ohio, while going down the river, convoyed by the gunboats Signal and Covington, was attacked by artillery and musketry, and the gunboats went to her assistance. About 125 men on the transport were killed and wounded; she was soon disabled; the Covington, after losing more than half her men, was abandoned and burned; the Signal also was disabled and, with the transport, surrendered. No further attempt was made to run the blockade, and for two weeks Banks' communication with the Mississippi was closed. The fleet having passed below the falls and the river rising insuring a safe passage of all the bars below, the gunboats and transports started on the morning of the 13th of May, and in the afternoon Banks marched out of Alexandria for Simpsport. From the start his front, flanks and rear were harassed by cavalry and artillery, and on the 16th he had a severe engagement near Mansura, in which the Confederates were driven from position they had taken across the road to Simpsport, which place his advance reached on the evening of the 17th. Here it was found that the pontoon-bridge was too short to span the Atchafalaya and Col. Bailey again improvised a crossing. The transports were ranged side by side across the river, with the planking of the pontoons laid across their bows, making a level road of about 700 yards, over which the main body of the army with its trains and artillery began passing on the 19th. While this bridge was under construction A. J. Smith's command was drawn up in line at Yellow Bayou, covering the rear of the army and the crossing of the Atchafalaya. Here Smith's troops were attacked on the afternoon of the 18th by Gen. Wharton's cavalry and Gen. Polignac's infantry. Smith's skirmishers were driven in, and at first the Confederates gained some advantage; but Gen. Mower, who was in immediate command of the Union line, made a counter-charge with two brigades of infantry and one of cavalry and the Confederate attack was repulsed. In endeavoring to follow up his success Mower was checked by a heavy artillery-fire, and withdrew to a thicket, where he formed a new line and brought up artillery. The Confederates renewed the attack and were repulsed with some loss. The thicket now took fire and

made an impassable barrier between the two sides, and Mower withdrew, leaving his dead and wounded on the field. The Union loss was 38 killed, 226 wounded, and 3 missing; the Confederate loss, 452 killed, wounded and missing, of whom 180 were taken prisoners. The army had all crossed the Atchafalaya on the 20th. Banks yielded the command to Gen. Canby, who had been ordered to relieve him; the navy and transports passed into the Mississippi; and the Red River campaign, one of the most humiliating of the war, had ended. On the return march from Alexandria the Union loss was about 165 killed, 650 wounded, and 450 captured or missing. Gen. Taylor says the Confederate loss in the entire campaign, from Sabine Cross Roads to Yellow Bayou, was 3,976. CARMAN.

Yellow Book of France, a government publication issued regularly since 1861, designed to furnish historians and others with official information. It is similar to the British Blue Book and the German White Book.

Yellow Boy, a popular name for a gold coin, formerly much used in the Far West. The term originated in Great Britain, the name being applied to the gold sovereign.

Yellow Copperas, a name sometimes used for the mineral copiatite. Crystallization, monoclinic, usually in translucent pearly yellow plates; hardness, 2.5; composition, a basic sulphate of iron; specific gravity, 2.1. Found near Copiapo as an incrustation on coquimbite; also in other places in South and North America.

Yellow Earth, a clay or kaolin strongly impregnated with hydroxide of iron or limonite. Its chief use is for pigment.

Yellow-eyed Grass, the common name of the genus *Xyris*, composed of rush-like plants, with bright yellow flowers produced from the summit of a naked scape, conspicuous in sandy bogs in July and August. They are mostly of tropical distribution about the world. The yellow-eyed grass (*X. bulbosa*) has a bulbous root; equitant, linear, twisted leaves; an erect, 2-edged, twisted scape; roundish, acute heads, supporting a number of small yellow flowers projecting from between the scales, with perianth and other parts of the flowers in threes. Another species with pretty, large petals (*X. caroliniana*), occurs near the sea from Rhode Island southward. The *X. fimbriata*, a plant two feet high, the divisions of its calyx conspicuously fringed on the wing-margined keel, and plumose at the summit, is found in the pine barrens of New Jersey and southward. The foliage and roots of *X. indica*, of *X. americana*, and of *X. vaginata*, are used for a remedy for leprosy and the itch, in India, Guiana and Brazil.

Yellow Fever is an acute infectious disease which is transmitted from the sick to susceptible individuals through the agency of mosquitoes. The yellow fever mosquito (*Stegomyia fasciata*) is found in tropical and semi-tropical regions, and especially in lowlands near the sea or in river valleys. This mosquito serves as "an intermediate host" for

YELLOW FEVER

the yellow-fever parasite, which is present in the blood of those sick with the disease during the first three days of the attack. After filling itself with blood from a yellow-fever patient a period of 12 days is required for the development of the parasite in the body of the mosquito before it can transmit the disease, by its sting, to another individual.

These facts have been established by the experiments of a board appointed upon the recommendation of the present writer, in 1900, for the study of yellow fever in the island of Cuba. The late Maj. Walter Reed, surgeon U. S. A., was president of this board, and the success attained is largely due to his carefully made plans and their intelligent and conscientious execution by himself and his associates.

In a "preliminary note" read at the meeting of the American Public Health Association, 22 Oct. 1900, the board gave a report of three cases of yellow fever which they believed to be the direct result of "mosquito inoculations." Two of these were members of the board, namely, Dr. Jesse W. Lazear, and Dr. James Carroll, who voluntarily submitted themselves to the experiment. Dr. Carroll suffered a severe attack of the disease and recovered, but Dr. Lazear fell a victim to the disease and to his enthusiasm in the cause of science and humanity. Fortunately no other deaths occurred during the subsequent experiments which Maj. Reed found it necessary to make in order to establish the fact that yellow fever is, beyond question, transmitted by mosquitoes of the genus *Stegomyia*, and in no other way. In a report made in May 1901, Maj. Reed says: "We have thus far succeeded in conveying yellow fever to twelve individuals by means of the bites of contaminated mosquitoes." These experiments were made upon individuals who volunteered to submit themselves to the mosquito inoculations with a full knowledge of the possibility of serious and even fatal results. Some of the volunteers were U. S. soldiers, and some were Spanish immigrants who had recently arrived in Cuba. Further experiments showed that blood drawn from a yellow-fever patient during the first three days of the disease and injected by means of a hypodermic syringe beneath the skin of a susceptible individual gives rise to a characteristic attack of yellow fever in the inoculated individual. But all attempts to demonstrate the specific infectious agent (yellow-fever parasite) in the blood or in the bodies of infected mosquitoes have been unsuccessful. This is probably due to the fact that the yellow-fever parasite is so small as to be practically ultra-microscopic. This inference is supported by experiments made in Cuba by Assistant Surgeon James Carroll, U. S. A., a member of the board heretofore referred to. Dr. Carroll found that when blood taken from the circulation of a yellow-fever patient was passed through a Berkefeldt filter a small quantity of the filtrate injected under the skin of a susceptible person gave rise to a typical attack of the disease.

The experimental results obtained by Maj. Reed and his associates have been fully confirmed by several independent investigators, including a board of experts from the Pasteur Institute of Paris, who were sent to Brazil to make researches with reference to the etiology of this disease.

Having ascertained that yellow fever is transmitted from man to man by an intermediate host—mosquitoes of the genus *Stegomyia*, Maj. Reed and his associates conducted a series of well-planned experiments for the purpose of ascertaining whether the disease may also be propagated, as has been commonly supposed, by clothing, bedding and other articles which have been in use by those sick with the disease. The results of these experiments were entirely negative. That is, all efforts to communicate the disease to susceptible individuals through the medium of such articles were without result.

In view of what has thus far been said it is evident that the preventive measures which were formerly relied upon to arrest the epidemic extension of this infectious disease were either of no avail or of comparatively little value. Isolation of the sick from contact with non-immune individuals is not necessary, but protection of the sick, by mosquito-bars, from the bites of mosquitoes is all-important. Disinfection of clothing and bedding is of no avail, but the destruction of infected mosquitoes, by sulphur fumigation or otherwise, is an essential measure of prophylaxis. Street cleaning and municipal sanitation generally have no material effect in preventing the extension of this disease, except in so far as they result in destroying the larvæ and breeding places of mosquitoes. Applying the knowledge gained by Maj. Reed and his associates in a practical way, as above indicated, the medical officers of the U. S. army stationed in Cuba have been able to completely eradicate yellow fever from the city of Havana, which had been the principal endemic focus of the disease for many years; and sanitarians feel confident that by the application of the same methods the epidemic extension of the disease within the limits of the United States, or elsewhere, may be entirely prevented. Thus has yellow fever, which formerly ranked with cholera and bubonic plague,—although having a more restricted area of prevalence,—as one of the most fatal scourges of the human race, been robbed of its power for mischief by the painstaking researches of scientific investigators. The limits of the present article only permit a brief reference to the history of the disease under consideration. It has a comparatively restricted geographic range, but there is every reason to believe that this might be greatly extended if cases of the disease should be introduced to all of the regions where the intermediate host (*Stegomyia fasciata*) of the "yellow-fever germ" is found. That the disease has not been introduced into regions remote from its principal endemic foci is probably due to the comparatively brief duration of the attack, to the fact that the infectious agent is only present in the blood during a brief period (three days) and to the circumstance that it cannot be transmitted in any other way than by inoculation—either directly, as in the experiments of Reed and his associates, or through the medium of an infected mosquito. Epidemics have occurred in the United States at all of our principal sea-ports on the Gulf of Mexico and on the Atlantic coast as far north as Boston. It has also invaded many of the Southern States, prevailing as a widespread epidemic in the interior, and has extended up the valley of the Mississippi as far as

YELLOW FEVER

St. Louis. It has been epidemic at all the principal sea-port cities of the West Indies, of Mexico, of Central America and of South American countries bordering upon the Gulf of Mexico; also upon the Pacific coast of Mexico and South America and in the Atlantic-coast cities of Brazil and the Argentine Republic. The cities of Havana, Vera Cruz and Rio de Janeiro have long been regarded as its principal endemic foci. The climate of these cities is favorable to the survival of the *Stegomyia* throughout the year. Consequently, when once introduced, the disease continued to be propagated through a series of cases, occurring successively without regard to seasons. Thus it was ascertained by the Yellow Fever Commission, of which the writer was a member (1879), that during the ten years from 1870-79 there was not a single month without some recorded deaths from yellow fever, and this continued to be the case until the disease was eradicated in 1901 by the well-directed efforts of Col. Gorgas, of the medical department, U. S. A. In his report as sanitary officer of the city of Havana for the month of November 1901, he says: "Last year (1900) we had, during this month, 214 cases and 54 deaths. This year the last case of yellow fever occurred on 28 September; that is, we have gone over two months without a single case or death belonging to Havana." . . . "This result I consider due to the system, introduced last February, of killing infected mosquitoes in the neighborhood of each point of infection as it developed." The introduction of yellow fever into the previously healthy city of Havana is recorded by the historian Pezuela, as follows: "Although Havana is situated on the northern boundary of the torrid zone, it was very justly considered one of the most healthy localities on the island before its invasion, in a permanent manner, by the *vomito negro*, imported from Vera Cruz in the summer of 1761. In May there came from Vera Cruz, with materials and some prisoners destined for the works on the exterior fortifications of Havana, the men-of-war *Reina* and *America*, which communicated to the neighborhood the epidemic known by the name of *vomito negro*. At the end of the following June there were stationed in this fort nine men-of-war, despatched from Cadiz, and sent to the chief of squadron, Don Entienne de Hevia; they brought a reinforcement of 2,000 men. More than 3,000 persons succumbed to the epidemic on this, the first appearance of the *vomito*."

History also records the first introduction of the disease to the city of Rio de Janeiro. The highest medical authorities in Brazil agree that yellow fever was not endemic in the principal seaports of the empire prior to the year 1849, when it was introduced to the city of Bahia by the North American brig *Brazil*, which sailed from New Orleans, where yellow fever was prevailing, and touched at Havana. Two of the crew of this brig died of yellow fever during her voyage from the latter port to Bahia. Soon after her arrival the disease made its appearance among those who had communicated with the ship. The first case occurred a few days after the arrival of this brig (3 November). From Bahia the disease was carried to Rio Janeiro, where during the epidemic season of 1850 it caused a mortality of 4,160.

In regions where the winter temperature is so low as to kill mosquitoes, or render them inactive, epidemics of yellow fever terminate upon the occurrence of frost, or of continued cool weather. Under such circumstances the disease is not apt to recur during the succeeding warm season, except as a result of a fresh importation of a yellow-fever case, from which mosquitoes of the new brood may become infected. Thus in the United States, even as far south as the city of New Orleans, a recurrence of the disease after its epidemic prevalence is probably rarely, if ever, due to the survival of infected mosquitoes from the year before. It has been shown, however, by Maj. Reed, and by others that infected mosquitoes may survive in a warm room for more than two months. Prior to the civil war yellow fever prevailed almost annually in New Orleans and was generally believed by the residents of that city to be "a disease of the climate" beyond the control of any preventive measures. Later, under a more stringent administration of quarantine restrictions, such success was attained by the health authorities in preventing the introduction of cases of the disease, and consequently of epidemics, that a complete change occurred in public sentiment and it is now generally recognized that the introduction of one or more cases from some foreign seaport—usually Havana or Vera Cruz—is an essential prerequisite for the development of an epidemic in the city of New Orleans. The years of greatest mortality in this city have been: 1847, 2,359; 1853, 7,970; 1854, 2,423; 1855, 2,670; 1858, 3,889; 1867, 3,093; 1878, 4,600.

In 1793 the city of Philadelphia, then a town of about 40,000 inhabitants, suffered a devastating epidemic, the mortality being about 4,000, or 10 per cent of the population. This city was again visited by the scourge in 1797, but the disease was less extended and less fatal—total mortality, 1,300. Philadelphia again suffered in 1798, the mortality being 3,645. The disease also prevailed during this year in more northern seaport cities, although the mortality was comparatively small except in New York, where the deaths numbered 2,080—Boston 200, Portsmouth 100, New London 81. The disease again prevailed in Boston, Philadelphia, Baltimore, Wilmington, and Charleston, in the year 1802. Minor epidemics continued to occur almost annually in one or more of our southern seaport cities until the year 1853, when a fatal and widespread epidemic occurred, involving considerable areas in the States of Florida, Alabama, Louisiana, Mississippi, Arkansas and Texas. The epidemic of 1867 was also notable in the annals of this disease, although the area of prevalence was not so great as in the epidemic of 1853. The disease prevailed extensively in the State of Texas, causing a mortality of 1,150 in the city of Galveston alone. In Louisiana the city of New Orleans suffered the heaviest loss (3,093). The next great epidemic within the limits of the United States occurred in 1873. The States of Florida, Alabama, Mississippi, Louisiana and Texas were invaded. The mortality in the city of New Orleans (225) was comparatively small, but Shreveport lost 759 of its inhabitants, and the disease extended its ravages to Memphis, Tenn., where there was a mortality of about 2,000.

The last great epidemic of yellow fever in

YELLOW FEVER

the United States occurred in 1878, when 132 towns were invaded in the States of Louisiana, Tennessee, Alabama, Mississippi, and Kentucky. The total reported mortality was 15,934, and the number of cases more than 74,000. Yellow fever has never invaded the populous countries of Asia, which have their own endemic pestilential maladies. It has been introduced from the West Indies to Spain and to Portugal, but is unknown as an epidemic in other countries of Europe. In Africa, it appears to be endemic on the west coast and some authors believe that this was the original home of the disease. Others contend that it was originally a disease of the West Indies and that its occurrence on the African coast resulted from the importation of cases from those islands. The early historians, Herrera, Oviédo, Rochefort, and others, make reference to epidemics among the natives which occurred prior to the discovery of the Antilles, and to fatal pestilential diseases among the first settlers of these islands; but their accounts are not sufficiently exact to enable us to affirm that the disease referred to by them was yellow fever. The west coast of Africa was discovered and colonized to some extent before the discovery of America, but the first authentic accounts of the prevalence of yellow fever on this coast date back only to the year 1778, over two centuries after the first settlements had been established. On the other hand, this very epidemic of 1778 at St. Louis (Senegal), was traced to importation from Sierra Leone, a portion of the African coast which, according to Hirsch, "appears to be the headquarters of the disease, and the starting-point of its epidemic inroad into the territories lying to the north and south, as well as into the West African islands."

Rochefort, whose 'Histoire naturelle et morale des îles Antilles de l'Amérique' was published in Holland in 1558, says of the West Indies: "The air of all those islands is very temperate, and healthy when one is accustomed to it. The *peste* was formerly unknown there as well as in China and other places in the Orient; but some years since the islands were afflicted with malignant fevers, which the physicians considered contagious. The bad air was brought there by some ships which came from the coast of Africa, but at present we hear nothing more of these maladies."

It seems very probable that a pestilential malady which prevailed for a time in these usually healthy islands and then disappeared, was in fact yellow fever, and that it was introduced by ships from the west coast of Africa is not at all incredible. Indeed, it almost seems necessary to look for an original endemic focus of the disease outside of the West Indies, for the reason that, in the comparatively few places where it is now endemic, there is historical evidence to show that there was a first importation and a previous period of exemption; while, on the other hand, the conditions upon which endemicity at the present day seem mainly to depend, were formerly unknown—conditions arising from the aggregation of population at seaport cities, as at Havana, Vera Cruz, and Rio Janeiro.

In 1879 the writer went to Havana, as a member of a commission appointed by the National Board of Health, for the investigation of questions relating to the etiology of yellow fever.

One of the main objects in view in the appointment of this commission was the discovery, if possible, of the specific cause of the disease. The commission was fully equipped with the best microscopical apparatus, and with whatever else seemed necessary to promote the accomplishment of the object in view.

As a result of investigations made at that time and subsequently at Rio de Janeiro in 1887 and in Havana in 1888 and 1889, I formulated the following conclusions in my final report:

"The specific cause of yellow fever has not yet been demonstrated.

"It is demonstrated that micro-organisms capable of development in the culture-media usually employed by bacteriologists, are only found in the blood and tissues of yellow fever cadavers in exceptional cases, when cultures are made very soon after death."

Subsequent researches by other investigators have not invalidated these conclusions. For while the researches of Reed and his associates have demonstrated the fact that the specific infectious agent ("germ") of the disease is present in the blood, they have failed, as heretofore stated, to isolate or to recognize this specific infectious agent, and no one else, up to the present time, has been more fortunate. Numerous claims have, however, been made to the discovery of the yellow fever germ.

My visit to Rio de Janeiro in 1887 was made with the special object of investigating the claim of Dr. Domingos Freire, of that city, who had published an elaborate work giving an account of his *Cryptococcus xanthogenicus*, and of his extensive inoculation experiments, made with a view to producing an immunity to the disease. In an address delivered in Paris in 1887, Freire gives the following account of his *cryptococcus*, which he claimed to obtain in cultures from the blood of yellow fever patients. He says:

"Each adult cell is ruptured at one or several points, and allows to escape its contents, composed of germs which are to perpetuate the species, and two pigments—one yellow, destined to infiltrate the tissues, and to produce the icteric color which has given name to the malady; the other black, insoluble, and destined to be carried along the circulatory current, producing either capillary obstructions or blood stasis in the parenchyma of the organs."

This account is entirely fanciful, and is evidently based upon erroneous observation and misinterpretation of what had been seen under the microscope, and to imperfect methods of research. No such micro-organism as Dr. Freire has described is known to bacteriologists, and certainly nothing of the kind is to be found in the blood and tissues of yellow fever cases, as Dr. Freire asserts.

With reference to Dr. Freire's protective inoculations, which he had practised, under government patronage, on a large scale, I say in my report to the President of the United States (1888): "There is no satisfactory evidence that the method of inoculation practised by Dr. Domingos Freire has any prophylactic value." Although Dr. Freire stoutly contested the truth of my conclusions, the scientific world has long since ceased to attach any importance to his claims.

A more recent claim to the discovery of the yellow fever germ is that made by Sanarelli, an

YELLOW-HAMMER

Italian bacteriologist, who visited Brazil for the purpose of making investigations with reference to the etiology of this disease. Sanarelli obtained from the blood of a certain proportion of the cases which came under his observation (post mortem) a bacillus which he believed to be the cause of the disease. His standing as a bacteriologist and his published papers relating the details of his experiments led to a general acceptance of his claims by members of the medical profession in Brazil and to some extent in other countries. But the researches of Maj. Reed and his associates have shown that the *Bacillus icteroides* of Sanarelli is a common and widely distributed species which has nothing to do with the etiology of yellow fever, although it may occasionally be obtained in cultures from yellow fever cadavers. It was not present in any instance in the blood obtained from patients in the early stage of the disease, when this blood was proved by experimental inoculations to be capable of reproducing the disease in non-immune individuals, nor could it be obtained from the bodies of infected mosquitoes which has been proved to be capable of communicating the disease.

Yellow fever is a disease in which immunity results from suffering one attack, and this immunity usually lasts for many years, or for life. Second attacks may, however, occur, although this is rare.

The mortality from the disease differs greatly in different epidemics and among different classes and races. It has been asserted that the negro race has a congenital immunity from yellow fever, but this is a mistake. The susceptibility of the negro is, however, much less than that of the white race, and among those attacked the mortality, as a rule, is small. This is shown by the statistics relating to white and black troops in the British service at West India stations. "While in Jamaica the annual loss among the former amounts to 102 per 1,000 of the mean strength, the deaths among the blacks did not exceed 8 per 1,000. In the Bahamas the mortality of the whites was 59 in 1,000, that of the blacks 5.6 in 1,000" (La Roche).

In the report of the Board of Experts appointed by Congress to investigate the epidemic of 1878, we find the following remarks: "Berkwick City, 40 cases among colored, no deaths." "Morgan City, 21 deaths among colored persons." "Brownsville (Tenn.), of 162 colored cases, 21 died." "Chattanooga, of 685 cases, 256 whites, 429 colored; of 164 deaths, 118 whites, 46 colored." "Decatur (Ala.), of 64 white cases, 28 died; of 168 colored, 21 died."

Barton gives the following figures, showing the mortality per 1,000 among different races, and those of the same race from different latitudes, in the city of New Orleans in the great epidemic of 1853.

	Per 1,000
Native Creoles.....	3.58
Strangers from West Indies, Mexico, and South America.....	6.14
Strangers from Southern States of the Union..	13.22
Strangers from Spain and Italy.....	22.06
Strangers from Middle States of the Union....	30.69
Strangers from New York and New England States.....	32.83
Strangers from Western States of the Union...	44.23
Strangers from France.....	48.13
Strangers from British America.....	50.24
Strangers from Great Britain.....	52.19
Strangers from Germany.....	132.01
Strangers from Scandinavia.....	163.26

Strangers from Austria and Switzerland.....	220.08
Strangers from Netherlands.....	328.94

There is probably no difference in the susceptibility of the sexes, but males are attacked in greater proportion than females, because they more frequently, and often recklessly, visit infected localities. The mortality is, as a rule, considerably greater among males. Ligon, in giving an account of the pestilence at Barbados in 1647, of which he was an eye-witness, says: "The cause was unknown; one could not say if the ships of commerce had imported the scourge, or if it came from bad food, marshy water, the intemperance of the colonists, and, above all, the great quantity of *eau-de-vie* which they drank. . . . It was the most debauched who perished first, and not one woman died for ten men." No doubt Ligon was right in ascribing the difference in the mortality of the sexes largely to the difference in their habits, with reference to the use of *eau-de-vie*. Those who habitually use spirituous liquors are less likely to recover from an attack than the temperate, and a recent debauch is a recognized predisposing cause.

The mortality among children is considerably less than among adults. This applies especially to children from 5 to 15 years of age. The mortality among children under 5 is somewhat greater.

The idea which formerly prevailed in New Orleans and Havana that native born citizens—"creoles"—have an inherited immunity from the disease is not well founded. Whatever immunity they may enjoy is no doubt, to a great extent at least, due to an attack of the disease frequently occurring during childhood and usually unrecognized.

Hinemann writes with reference to Vera Cruz: "Until lately the physicians and people of Vera Cruz supported with fanaticism the dogma that natives were absolutely exempt from yellow fever. But the fearful epidemics of recent years (1875, 1877, 1878) have worked a change; for so many native children and adults suffered, that the truth could no longer be denied that these do not enjoy an absolute immunity."

In Cuba, the dogma that creoles are exempt from yellow fever, did not withstand the searching investigation made by the Havana Yellow Fever Commission of 1879.

Nevertheless the mortality from this disease among the creole population of cities where it has established itself as an endemic malady is comparatively small, and by far the largest quota of its victims is drawn from among the strangers who visit the infected places, or residents who have recently located in them.

GEO. M. STERNBERG,
Surgeon-General U. S. A.

Yellow-hammer, originally, in Great Britain, the common yellow bunting (*Emberiza citrinella*), which is yellow above, varied by dark-brown patches, the under parts being pure yellow, and the wing-feathers dusky black, with brown or yellow edges. The flanks are of a brownish hue. The nest is placed on the ground, and is composed of grasses, moss, roots, etc., and lined with hair. These birds, when fat, in the autumn, are much in request for their flesh. These inoffensive birds are regarded with superstitious dislike in some dis-

YELLOW JACK—YELLOW PINE INDUSTRY

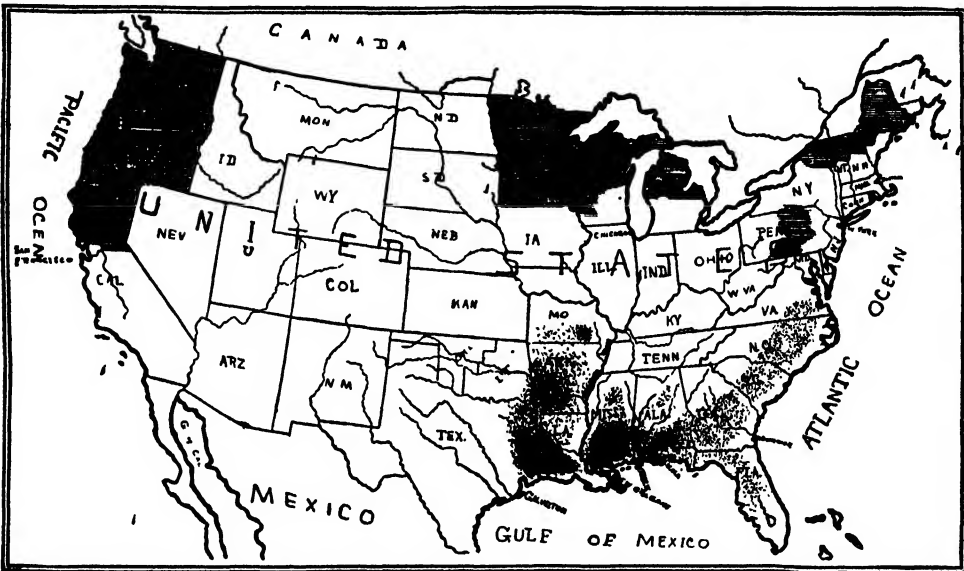

tricts, and their eggs are broken by boys whenever they are discovered, a foolish saying being current that each egg contains a drop of "devil's blood." In the United States the term is misapplied to the goldenwinged woodpecker or highhole. See FLICKER.

Yellow Jack, a quarantine flag displayed at naval hospitals and from vessels in times of epidemics (see QUARANTINE). Also a common name for yellow fever.

Yellow-jacket, any species of small American wasp, marked with black and yellow stripes. See WASP.

Yellow Pine Industry, The. No branch of American lumbering is of such importance as the yellow pine industry of the southern States. The States in the yellow pine district include Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Texas, Arkansas, and Missouri. In

small portable mill, which cuts yearly 100,000 feet, to the colossal modern forest-destroyer, employing hundreds of men, requiring miles of log road, and producing 50,000,000 feet per annum. Of these 10,000 sawmills, only 231 were reported in 1900 to have a capacity of 10,000,000 feet and upward. North Carolina has the greatest number of small mills,—over 1,800,—while Louisiana has the greatest number of large modern plants. The government reports for 1900 show that there were 149,908 laborers in the lumber industry of the States in which lies the yellow-pine belt. These men draw yearly a combined wage of \$35,000,000, and help to put forth a product which finds its way into almost every part of the civilized world. The seaports figuring conspicuously in the exporting of yellow pine are: Brunswick, Ga.; Pensacola, Fla.; Mobile, Ala.; Gulfport, Miss.; Pascagoula, Miss.; Sabine Pass, Texas; and New Orleans, La. Pensacola is the largest exporter,

A Map from the 'Review of Reviews' showing the Location of the Four Great Lumber-Producing Districts in the United States, with the General Distribution of Yellow-Pine Timber in the South (Approximately speaking, the stand of yellow pine per acre is about as follows: Florida, 2,500 feet; Alabama, 5,000 feet; Arkansas, 5,000 feet; Mississippi, 8,000 feet; Louisiana, 8,500 feet; Missouri, 4,000 feet; Texas, 8,000 feet; No. Carolina, 4,000 feet; So. Carolina, 4,000 feet; Georgia, 4,000 feet; and Virginia, 3,500 feet.)

this section are situated 43 per cent of the sawmills of the country. The amount of standing yellow-pine timber in the South was estimated by the government, in 1903, to be 177,000,000,000 superficial feet. The distribution of this timber is approximately as follows:

STATE	Number of acres	Number of superficial feet
Alabama	2,250,000	11,250,000,000
Arkansas	2,000,000	9,000,000,000
Florida	5,000,000	12,500,000,000
North Carolina, South Carolina, Virginia, and Georgia	7,000,000	28,000,000,000
Mississippi	5,000,000	40,000,000,000
Louisiana	4,500,000	38,250,000,000
Texas	4,500,000	36,000,000,000
Missouri	1,500,000	2,000,000,000

There are almost 10,000 sawmills in the yellow-pine belt of the South, varying from the

with Mobile a close second. The importance of these last two ports may be realized by a glance at the following figures:

	1902	1903
Total export of yellow pine	906,742,088 superficial feet	
Export of yellow-pine lumber and timber from Pensacola	263,304,036 superficial feet	337,415,577 superficial feet
Export of yellow-pine lumber and timber from Mobile	236,985,472 superficial feet	238,660,451 superficial feet
Total export of lumber and timber from the United States	1,458,110,268 superficial feet	

There are three distinct markets for southern yellow pine,—the local, the foreign, and the domestic. The local market consumes about 15 per cent of the output, the foreign 10 per cent, and the domestic 75 per cent. Hence, it is seen that into the interior and eastern States

YELLOW PUCCOON — YELLOWLEGS

goes the bulk of southern yellow pine. The lumber in this last-named trade is generally kiln-dried and dressed, while to foreign countries are sent rough lumber and great quantities of square timber. See also **PINE**.

Yellow Puccoon. See **PUCCOON**; **GOLDEN SEAL**.

Yellow-rattle, a scrophulariaceous plant, *Rhianthus crista galli*, an annual herb with opposite, lanceolate, sessile leaves, and terminal, one-sided, leafy-bracted spikes of yellow flowers. The corollas are two-lipped, with an arched upper lip, and three-lobed lower one. The capsule is orbicular and flat, with several round-winged seeds, which rattle about the pod when shaken, and have given rise to other descriptive names, such as rattle, rattle-box, penny-rattle, etc. In European fields it is very abundant and becomes a pest, since it is parasitic and attaches itself by suckers to the roots of living grasses.

Yellow Ribbon, Order of the. See **ORDERS, ROYAL**.

Yellow River. See **HWANG** or **HOANG-HO**.

Yellow-root, either one of two ranunculaceous plants, one being known as the shrub yellow-root (*Xanthorrhiza apiifolia*). Its long roots and rootstock, leaves, bark and pith, are bright yellow, and the root is extremely bitter and astringent, and is used as a tonic. This yellow-root grows in the southern United States and has pinnate leaves clustered at the top of a short stem, giving the plant a fern-like aspect. The foliage turns to gorgeous lines of scarlet and orange in the autumn. The five-merous flowers are wine-colored. The other yellow-root (*Hydrastis canadensis*) is known also as golden-seal, or yellow puccoon; its root is a tonic drug. The plant has abundant reniform, palmately-lobed, basal leaves, and two cauline ones, the uppermost of these subtending the solitary, greenish-white flower. The puccoon (q.v.) is found in woods in the eastern United States and furnished the Indians with a favorite yellow dye.

Yellow Sea, or **Hwang-hai**, hwāng-hī', a gulf of the Pacific Ocean, extending between the northeast coast of China, and the western coast of Korea, northward to Manchuria; length about 620 miles; greatest breadth about 400 miles. North and northwest it terminates in the gulfs of Liao-tung and Pe-chi-li, the latter of which receives the waters of numerous large and important rivers. On the east coast are numerous groups of islets, part of them included in the Korean Archipelago. The Yellow Sea is very shallow, and is so named from the muddy lemon-yellow color of its waters near the land, caused by the large quantity of alluvium continually brought into it by the Hwang-ho or Yellow River, and the Yang-tse-Kiang, which gradually tends to decrease its depth.

Yellow-weed. See **DYER'S ROCKET**.

Yellow-wood, a name applied to several timber trees and shrubs, including *Cladrastis lutea*. This is an uncommon leguminous tree, known in cultivation as the virgilia, American or Kentucky yellow-wood, and is indigenous to the United States from Kentucky southwards. The yellow-wood attains to a height of 60 feet, with a trunk some two feet in diameter. It usu-

ally divides into two or three limbs not far from the ground, which ramify into slender and somewhat drooping branches, forming a broad, graceful head. In winter the smooth, silvery-gray bark of its main trunk, and reddish-brown of its delicate sprays, are very interesting. The limbs, however, are brittle and break easily. The foliage of the yellow-wood consists of light-colored, odd-pinnate leaves, turning to clear yellow in autumn; and fragrant panicles a foot or more long, of flowers, pea-like and milk-white, droop from the ends of the branches. The fruits are linear legumes. A yellow dye was made from the hard golden-tinted wood, which is used for fuel and occasionally for gun-stocks. The yellow-root (q.v.) (*Xanthorrhiza*); the Osage orange (*Maclura aurantiaca*), a favorite hedge plant; fustic, a dyestuff yielded by the wood of *Maclura tinctoria*, a West Indian tree with oblong, taper-pointed leaves and an edible fruit; and *Schafferia frutescens*, the valuable boxwood of the West Indies, are all known as yellow-woods. Australian yellow-woods are the *Acronychia laevis*, *Hovea longipes*, and *Xanthostemon pachysperma*; and the white teak, or Queensland yellow-wood (*Flindersia oxleyana*), also called light yellow-wood, is a tall, slender tree with many branches. Another tree called light yellow-wood is the *Rhus rhodanthema*, bearing large red flowers, and growing to 80 feet in height. It is native to Queensland, and yields a fine cabinet-wood, close-grained, capable of taking a fine polish, sound and durable. Natal yellow-wood is a tree of about the same height (*Podocarpus elongata*), with a close-grained wood which will not bear exposure out of doors, but is extensively used for furniture and interior house-building. The bastard yellow-wood of the same region is *P. pruinosa*, with a tough durable wood, also used in house building; still another species (*P. latifolia*), an evergreen about 80 feet high, and having an aromatic wood, is the East Indian yellow-wood. This same name is given to the satin-wood (*Chloroxylon swietenia*). The prickly yellow-wood is *Xanthoxylum caribaeum* (q.v.).

Yellowbird, any of several familiar birds prevailing yellow in plumage. In the United States the name belongs to two small garden-visitors. One is the goldfinch (q.v.), and the other, often distinguished as "summer" yellowbird, is a warbler (*Dendroica aestiva*), common in summer throughout all the eastern United States and Canada. It is greenish yellow, brightest on the breast, where it is diversified by salmon-colored streaks. The song is a melodious trill, often heard among the roses and lilacs of the garden, where the bird is likely to fix its deep nest of hempen shreds in an upright fork. The eggs are pink, with reddish and purplish dots. This nest is one of the receptacles most often chosen by the cow-bird for its surreptitious egg; but the yellowbird frequently defeats the intruder's object, by building a new nest on top of the first one, burying the strange egg.

Yellowhead, a yellow-headed blackbird. See **BLACKBIRD**.

Yellowlegs, a genus (*Totanus*) of birds of the family *Scolopacidae*, large snipe-like species with cross-barred tail-feathers, well-marked gape, long, slender non-sensitive bill and green-

YELLOWPLUSH PAPERS — YELLOWSTONE NATIONAL PARK

ish yellow legs, from which they take their common names of yellowlegs, green-shanks, etc., while, because of their constant noisy calling, they are known to gunners as tattlers or tell-tale snipe. The greater yellowlegs (*T. melanoleucus*) inhabits during some part of the year nearly the entire American continent and breeds chiefly north of the United States, in which it is well known as a coastwise migrant. It is 13 to 14 inches long, with a spread of wings of two feet. Above the color is a mixed dark ashy, varying with the age and season, below white streaked and barred with ashy black. Although chiefly a maritime bird, this species also migrates through the Mississippi Valley and is found about the lakes of the interior; and even along the coast it is fond of frequenting the fresh and brackish pools on the meadows, where it finds an abundance of food in the small fishes, mollusks, shrimps and crabs. It also eats worms, insects and the spawn of fishes, which it catches with great facility. During the migrations, which occur in April and from late August to October through the greater part of the United States, it is commonly seen in small parties of 6 or 8, often consorting with other species of tattlers, willets and godwits. The flight is swift and often elevated, and in alighting in pools in which they wade leg-deep they keep the wings raised until well settled. They are extremely alert and noisy and thus provoke the indignation of gunners. The nest is a grass-lined depression on the ground and the four, pyriform, greenish yellow, brown and gray blotched eggs measure upward of two inches in length. The lesser yellowlegs (*T. flavipes*) is in form and colors nearly an exact miniature of the last, but is only 10 or 11 inches long, with a spread of 20 inches. Its range and habits are similar to those of the larger species, but it is much commoner in the East and flies in much larger flocks. It is much better known to shooters of shore-birds. The eggs are more variable, the ground-color being clay or buff, and the markings usually very bold and distinct. The European green-shank (q.v.) occasionally straggles to our shores and may be distinguished from *T. melanoleucus*, which it resembles in size, by the distinctly green color of the lower legs and feet. About a dozen related species are found in other parts of the world and the genus *Heterodromas*, containing our solitary and green sandpipers, is closely allied. For methods of shooting see SANDPIPER.

Yellowplush Papers. The, a series of satirical papers by William M. Thackeray, which appeared in 'Fraser's Magazine' in 1837-8, as 'The Yellowplush Memoirs,' and in book form in 1841.

Yellows, a disease of the peach (q.v.).

Yellowstone, formerly **Sublette**, a lake in the Yellowstone National Park (q.v.), at the northeast base of the Rocky Mountain range. It has an elevation of nearly 7,800 feet above sea-level. It is irregular in form, having extensions called West Arm, South Arm, and South-East Arm. The Yellowstone River flows through the lake, or as sometimes given, the lake is an expansion of the river. It is about 20 miles long and 15 miles wide.

Yellowstone, a river which has its rise in the Shoshone Mountains, in the northwestern

part of Wyoming, near lat. 44° N. It flows north, entering the Yellowstone National Park (q.v.) at the southeast corner, and passes through Yellowstone Lake, which is usually called an expansion of the river. From the lake the course is northeast, east, then northeast to the Missouri River, which it enters at Buford, on the boundary between Montana and North Dakota. The total length of the stream is about 1,000 miles. It is navigable for nearly 800 miles from its junction with the Missouri. The largest tributaries come from the south and are Big Horn, Powder, Rosebud, and Tongue rivers. The Grand Cañon of the Yellowstone (see YELLOWSTONE NATIONAL PARK) is one of the wonderful sights in a region of wonderful scenery.

Yellowstone National Park, a government reservation in the northwestern part of Wyoming and extending into Idaho and Montana about 11 miles along the western boundary of the park and into Montana about three miles along the northern boundary. In 1872 Congress set apart 3,575 square miles as "a public pleasure ground and a game preserve." In 1891 a tract of nearly 2,000 square miles was added to the east and south, making the total area 5,575 square miles. The mean altitude of the plateau portion is 7,800 feet. The "Continental Divide" passes through from the southeast to the northwest, and the "Rocky Mountain Divide" through the western part. Surrounding the park are numerous snow-clad mountains; on the south are the Shoshone Mountains, the Big Game and Teton ranges, on the east an extension of the Shoshone and on the southwest the Teton Range, the Big Bend Ridge on the west, and the Gallatin Range, part in the park, on the northwest. Some of the high peaks on the east are Index, 11,740 feet; Saddle Mountain, 10,676; Sunlight, 10,678; Fortress Mount, 12,073; and Ishawooa Cone, 11,840. Within the limits of the park is the Absaroka Range on the eastern border, with numerous vast peaks; as Table, Humphrey, Schurz, Langford, Chittenden, Cathedral, and Stevenson. In the northeast, and inside the Absaroka Range, are the Specimen Ridge and the Mirror Plateau. In the northern and southern parts of the park are lofty elevations; Mount Holmes of the Gallatin Range and Bunsen Peak are among the highest. In the southern part of the park is Sheridan Mountain, 10,385 feet high, the highest point of the Red Mountains. This elevation was named in honor of Philip H. Sheridan. A large part of the peak is formed of porphyry of a purple-pink color. Mount Washburne in the north is noted as the peak from which large portions of the park may be seen. It was named in honor of H. D. Washburne, who explored this region in 1870. There are over 20 high peaks within the limits of the park. The central plateau is composed of vast quantities of lava, in some places 2,000 feet deep. The Absarokas Range are made up of volcanic rocks, and nearly every part of this peculiar range shows the marks of having gone through a period of volcanic action. Sheridan in the south and Washburne in the north have been active volcanoes. Between Yellowstone and Shoshone lakes is a volcanic ridge about 255 feet in height. Six miles from the Grand Cañon of the Yellowstone is Sulphur Mountain, an immense mound of pure sulphur

YELLOWSTONE PARK.

Terraces built by the overflow of Geysers (Mammoth Hot Springs).

YELLOWSTONE NATIONAL PARK

crystal with a number of steaming springs at its base.

Rivers and Lakes.—The "Continental Divide" marks the land-line of separation of the waters of the Atlantic and the Pacific. The headwaters of several large rivers are in the park; Yellowstone, Snake, Lewis, Madison, and Shoshone are some of the streams which have headwaters here. The Yellowstone River (q.v.), Missouri River's longest tributary, rises or passes through Yellowstone Lake, for a stream which enters the lake on the opposite side is, also, called Yellowstone. The Grand Cañon of the Yellowstone is one of the wonders of this "Wonderland." Its walls on one side are 2,000 feet, and on the other side there is a gradual descent half way down of sliding cinnabar and other delicately tinted chalky formations, broken at intervals by towering pinnacles of mineral rock, which stand out in bold relief against the brilliant background. These pinnacles take on many fantastic forms, inspiring the delusion that one is looking down upon the decaying splendors of antique architecture. From the base of these solemn sentinels, the descent to the water line is as abrupt as from surface to torrent on the opposite side. Far below winds the foaming current of white-crested wavelets spread out like a silvery band. Though the channel is 160 feet wide, it appears no larger than a brook. The whole volume of water breaks over a ledge, in the centre of which stands a huge black bowlder which divides the waters for a few feet, and again uniting they fall 370 feet. Showers of spray are sent up, which when touched by the sunlight look like innumerable and varied colored jewels. Another falls above the main waterfall, is of considerable height and great beauty, and above are a series of cascades. The Grand Cañon is about 10 miles long. Tower Falls are so named on account of a mass of stone, about 100 feet from the verge of the precipice. The water below flows over a ledge about 150 feet high, and falls in solid sheets. Belcher River drains the southwestern part of the park. Madison, another tributary of the Missouri, has its source at the confluence of the Gibbon and Fire Hole rivers in the western part. In the northwest is the Gardiner River, a branch of the Yellowstone. Yellowstone Lake (q.v.), the largest body of water in the park, is said to have 300 miles of shore line, but it never has been fully explored. It certainly is the gem of the lakes, set as it is in a series of mountain peaks, with pine-clad slopes and snow-crowned summits. The monotony of its crested waves is broken by a verdure-clad island, Frank Island, giving it the appearance in summer of an emerald in a setting of brilliants. Shoshone Lake, next in size, is west, and Heart Lake is south of Yellowstone. North of Yellowstone is a group of small lakes, the largest of which is White Lake. They are northwest of Plican Cone. Near Mount Chittenden is Turbid Lake.

Geysers and Hot Springs.—The Yellowstone Park is famous for its numerous geysers; it is one of the four regions in the world where there are groups of large geysers. There are three geyser basins located in the valley of the Fire Hole River, at an average altitude of 7,000 feet above the sea-level; Upper Geyser, Middle Geyser, and Lower Geyser. The Upper, or Great Geyser basin, is the most active. Here are located the great spouters, conspicuous among

which are the Giant, Giantess, Castle, Saw Mill, Bee Hive, Lion, Grand Cornet and Cub, and last, but by no means least, Old Faithful. They are all appropriately named. The Giant and Giantess are so called on account of the immense size of their craters and the force of their action; the Bee Hive and Castle because of the peculiar formation of their cones; the Saw Mill and Lion from the roaring noise they make when in a state of activity; and Old Faithful on account of the regular discharges of steam and water at intervals of 64 minutes. One can rely absolutely on Old Faithful giving an exhibition every hour and four minutes. The stated intervals of activity have not varied in the memory of the oldest visitor to the park. Other geysers are variable in the time of their action; all are subject to changes. The Bee Hive is becoming more active every season. It gives an exhibition two or three times every 24 hours. The Giant and Giantess and Castle can not always be relied upon, but they make a magnificent display when in action. The Giant averages an exhibition about every six days and the Giantess about every 11 days. Near the main cone of the Giant Geyser is a small fissure, which seems to do for the Giant what an escape pipe does for a large boiler. When the chambers of the main crater become fully charged, short puffs of steam come hissing through this fissure. The grandeur of the spectacle which follows passes description. The interior forces seem to combine in making a display of power. Accompanying a stunning shock, caused by the volume of steam escaping, a column of water about 10 feet in circumference is thrown up to a considerable height, and emits a dense cloud of steam, so that it is difficult to see what appears in the centre to be a massive marble pillar. But the steam soon floats away and a column of great beauty stands revealed in all its grandeur. In a few seconds comes another change, the column is shattered, the law of gravity asserts itself, and the great body of water which went up in a grand column falls in showers of spray. The greater part of the water returns to the crater, and the overflow is carried off by Fire Hole River, a stream well named, as it flows rapidly through three basins fed by many boiling springs and numerous geysers.

There are no cone geysers in the Middle Geyser basin. The great wonder of the Middle basin is "Hell's Half-Acre." This is located on the bank of Fire Hole, and is a steaming abyss, about 30 feet deep, in a limestone formation. Four or five times each day, at irregular intervals, it gives most astonishing exhibits. A short distance from "Hell's Half-Acre" is a boiling lake, the waters of which are a beautiful blue. The blue liquid-overflow winds over formations which for years have been changing in form and color, making a sight the like of which is nowhere else in the world. The reflection of the trees and hills in the colored water adds to the picturesque beauty of the scene. The "Devil's Paint Pot" is a boiling caldron of many colored clays, which bubble and steam and change their colors in a way most interesting. The Mammoth Hot Springs are in the northern part of the park, not far from Cinnabar, the railroad station in Montana. They are somewhat similar to the springs in the Fire Hole basin. The deposits left by the water have built up scalloped terraces. Some of the results of their activity

YELLOWSTONE NATIONAL PARK

exist in a marked degree on the banks of the Gardiner River. There are places where the water from the geysers is no longer changing the terrace formations, and which seem to be over caverns as indicated by the sound of footsteps. In some parts caverns have been explored, and found to contain many beautiful specimens of stalagmites and stalactites. The springs of this locality are as varied in color and form as in activities. The "Goddess of Liberty" is a mass of limestone, 40 or 50 feet high, and shaped like the cap of the Goddess of Liberty. The Mud Geysers, north of and near Yellowstone Lake, are what their name indicates. At irregular intervals mud and water are shot up quite a distance. This slimy substance falls on the dead cedars which have been killed by the hot substance; but that evergreen cedars grew here shows that vegetation existed long before the present conditions. There are geysers near Heart Lake and in other parts of the park. There are nearly 100 active hot springs and geysers within the park. The geysers change, some becoming extinct, and new ones appearing. In 1878 a large geyser made its appearance in the Norris Basin, near the headwaters of the Madison River. Hot springs are found everywhere in the park; on mountains, in valleys, in the beds of lakes and rivers, near cañons, and near cold water springs. They vary in size, some cover acres, others only inches of surface. There are also a large number of mineral springs and numerous springs of clear cold water. The whole park and much of the adjoining region are volcanic.

Climate.—The climate is not as severely cold as in other parts of the Rocky Mountain region of the same altitude. The winter season practically begins with September or the last of August. The mean temperature in January is about 20°; occasionally the temperature falls to 30° below zero. The summers are short; vegetation begins to grow in May and in July has reached its most luxuriant state. In the last of August the change from summer to winter is usually sudden. In July the mean temperature is 62°; sometimes in summer the temperature rises to 96°. A hot day in summer may be followed by a cold night, even frost appearing. On the plateau the average annual rainfall is 20 inches.

Flora.—Nearly all the park area is covered with forests, chiefly composed of coniferæ. The treeless regions are the summits of the high mountains, the marshy bottoms, and the steep rocky slopes. The black pine is the most common; in some places there are forests composed almost wholly of black pine (*Pinus Murrayana*), which here do not attain any great size. The balsam is found on the high plateaus, and varieties of fir and spruce are abundant. Forests exist at an elevation of 9,700 feet. Grasses are found on the plateaus, and the herbaceous vegetation found in the Rocky Mountains. Above the timber line the vegetation is about as in other parts of the summits of the Rocky Mountains. The gentian is one of the favorite flowers of this section. Near the hot springs the vegetation is affected by the overflow and other causes; it is stunted and in some places has been killed entirely. Petrified trees are found in the northwest.

Fauna.—The wild animals of the park are protected by government laws, and as a conse-

quence are becoming more numerous than in other parts of the Rocky Mountains. A herd of buffalo is one of the features of the place. The animals found here are deer, antelopes, elk, mountain lions (pumas), beaver, black and brown bears, and moose. Sheep are found on the high lands. Grouse is found in some parts, but there are not many birds in this region. Fish abound, trout is in many streams.

Government and Improvements.—Since 1872 the government has had entire control of a portion of what is now the Yellowstone National Park, and later took control of additional lands, and now has entire jurisdiction over all the park. The administrative officials are under the Secretary of the Interior. An army officer is the superintendent in direct charge, and he has as his aids a detachment of Federal troops. On 1 July 1900, the Secretary of the Interior gave to the public the following instructions:

The following rules and regulations for the government of the Yellowstone National Park are hereby established and made public pursuant to authority conferred by section 2,475, Revised Statutes, United States, and the act of Congress approved 7 May 1894:

(1) It is forbidden to remove or injure the sediments or incrustations around the geysers, hot springs, or steam vents; or to deface the same by written inscription or otherwise; or to throw any substance into the springs or geyser vents; or to injure or disturb, in any manner, or to carry off any of the mineral deposits, specimens, natural curiosities, or wonders within the park.

(2) It is forbidden to ride or drive on any of the geyser or hot spring formations, or to turn loose stock to graze in their vicinity.

(3) It is forbidden to cut or injure any growing timber. Camping parties will be allowed to use dead or fallen timber for fuel.

(4) Fires shall be lighted only when necessary, and completely extinguished when no longer required. The utmost care should be exercised at all times to avoid setting fire to the timber and grass, and any one failing to comply therewith shall be punished as prescribed by law.

(5) Hunting or killing, wounding or capturing of any bird or wild animal, except dangerous animals, when necessary to prevent them from destroying life or inflicting an injury, is prohibited. The outfits, including guns, traps, teams, horses, or means of transportation used by persons engaged in hunting, killing, trapping, ensnaring, or capturing such birds or wild animals, or in possession of game killed in the park under other circumstances than prescribed above, will be forfeited to the United States, except in cases where it is shown by satisfactory evidence that the outfit is not the property of the person or persons violating this regulation, and the actual owner thereof was not a party to such violation. Firearms will only be permitted in the park on written permission from the superintendent thereof. On arrival at the first station of the park guard, parties having firearms will turn them over to the sergeant in charge of the station, taking his receipt for them. They will be returned to the owners on leaving the park.

(6) Fishing with nets, seines, traps, or by the use of drugs or explosives, or in any other way than with hook and line, is prohibited. Fishing for the purposes of merchandise or

BRIDAL-VEIL FALL IN THE YELLOWSTONE PARK.

YELLOWTAIL—YENIKALÉ

profit is forbidden by law. Fishing may be prohibited by order of the superintendent of the park in any of the waters of the park or limited therein to any specified season of the year, till otherwise ordered by the Secretary of the Interior.

(7) No person will be permitted to reside permanently or to engage in any business in the park without permission, in writing, from the Department of the Interior. The superintendent may grant authority to competent persons to act as guides and revoke the same in his discretion, and no pack trains shall be allowed in the park unless in charge of a duly registered guide.

(8) The herding or grazing of loose stock or cattle of any kind within the park, as well as the driving of such stock or cattle over the roads of the park, is strictly forbidden, except in such cases where authority therefor is granted by the Secretary of the Interior.

(9) No drinking saloon or bar room will be permitted within the limits of the park.

(10) Private notices or advertisements shall not be posted or displayed within the park, except such as may be necessary for the convenience and guidance of the public, on buildings on leased ground.

(11) Persons who render themselves obnoxious by disorderly conduct or bad behavior, or who violate any of the foregoing rules, may be summarily removed from the park, and will not be allowed to return without permission, in writing, from the Secretary of the Interior or the superintendent of the park.

Any person who violates any of the foregoing regulations will be deemed guilty of a misdemeanor, and be subjected to a fine, as provided by the act of Congress approved 7 May 1894, "to protect the birds and animals in Yellowstone National Park and to punish crimes in said park, and for other purposes," of not more than one thousand dollars, or imprisonment not exceeding two years, or both, and be adjudged to pay all costs of the proceedings.

Prior to 1870 little was known about the region now included in the park. In 1870 H. D. Washburne, surveyor-general of Montana, and G. C. Doane, an army officer, explored this region and gave the first report of the wonderful springs and geysers. In 1872 the government sent Ferdinand V. Hayden, United States geologist, and a number of assistants, to explore this region. The place is visited annually by thousands of tourists and accounts of this wonderful park have been published in all languages.

Consult: 'Wonderland,' an annual published by the Northern Pacific Railroad; Chittenden, 'Yellowstone National Park'; Richardson, 'Wonders of Yellowstone'; United States Geological Survey.

Yellowtail, or **Blanquillo**, a trachinoid fish (*Caulolatilus princeps*) of the coast of Southern California and southward, allied to the Atlantic tilefish (q.v.), which reaches a length of 40 inches. It abounds about rocky parts of the coasts, is good food and interesting as a gamefish. Several other fishes in various parts of the world are called yellowtails, in reference to the yellow or orange color of the tail fin.

Yellowthroat. See MARYLAND YELLOW-THROAT.

Yemassee, yēm-a-sē', **The**, a romance of South Carolina in the colonial period, by William Gilmore Simms, published in 1835. The leading events of the tale are in accordance with history. The Yemassee are a powerful tribe of Indians whose hunting grounds are gradually encroached upon by the English colonists, who, by purchases, seizures, and intrigues, presently change the feeling of friendship with which their advent was greeted, into fear, and finally into savage revolt.

Yemassee War. See COLONIAL WARS IN AMERICA.

Yem'en, Arabia, a division occupying the southwest angle of the peninsula, and known both to the ancients and moderns as Arabia Felix (Arabia the Happy), from a mistranslation by Ptolemy of *Yemen*, which does not signify happy, but the land lying to the right of Mecca. Yemen, in the widest sense, is bounded on the west by the Red Sea, on the south by the Gulf of Aden, on the north by Hejaz and Nejd, and on the east by Hadramaut. It comprises two regions physically distinct: the Tehāma or Lowland, lying between a chain of mountains which extends throughout the country and the west coast; and an elevated mountainous tract to the eastward of the former. The Tehāma varies in breadth from 10 to 30 miles, and is a barren desert wherever it is not irrigated by the mountain streams. The mountains rise abruptly from the desert plain, enclosing valleys of great luxuriance. The table-land in the interior has an estimated elevation of 4,000 feet, and some of its mountain groups, as Sabar, south of Taes, attain a height of 7,000 to 8,000 feet. The loftiest of these mountains are covered with forest to the summit, and the table-land abundantly produces coffee, dates, senna, tobacco, and other productions of rather a warm temperate than a torrid region. Yemen, considered in the extent above indicated, has no longer a political existence; the frontier provinces have in some instances become independent, and the Yemen proper of the present day, or the Turkish vilayet known by this name, does not embrace above two thirds of the territory formerly included under the same general title. Its approximate area is 77,200 square miles. Yemen, taken collectively, still bears unmistakable traces of its ancient superiority in wealth and civilization. In its numerous well-built towns are many rich merchants, while in the well-populated rural districts the peasantry are generally in easy circumstances. There are two great schools or universities, one at Zebid for Sunnites, and another at Damar for the Zeidē. The principal towns are Sana, the capital, Mocha, and Aden, which last is now in the possession of the British. Pop. 750,000. See ARABIA.

Yembo-el-Bahr, yēm'bō-ēl-bār, Arabia. See YAMBO.

Yen, a Japanese coin issued in 1, 2, 5, 10, and 20 yen pieces (gold). A gold yen is equal to 49.8 cents in United States gold.

Yenikalé, yēm-ē-kā'lā, **Strait of**, called also **Strait of Kaffa** and **Strait of Kertch**, Russia, connects the Black Sea with the Sea of Azov; it is about 25 miles long and from 2½ to 8 miles broad, but in some places is so shallow as to leave a channel of little more than two fathoms deep.

Yenisei, yĕn-ĕ-sā'ĕ, Siberia, the longest river of the region, formed by numerous streams from the mountain ranges bordering the Chinese and Russian empires. It has at first a circuitous, and then an almost direct northward course of about 3,400 miles, finally reaching the Arctic Ocean through the long estuary, and gulf of the same name. Its breadth varies from 3,000 feet to 14 miles in its estuary which is 140 miles long, and its depth varies from 11 to 90 feet. The area of its basin is estimated at about 1,000,000 square miles. A canal connects it with the Ob. The principal towns on its banks are Minusinsk, Krasnoiarsk, Yeniseisk, and Turukansk; it is navigable to the last-named town for large vessels. The waters of the Yenisei are clear and rich in fish. They are navigated by paddle steamers, drawing barges, and by a number of five or six cornered flat-bottomed boxes which convey flour down stream, and are broken up at their destinations. The Yenisei receives from the right the Upper Tunguska or Angara (the outlet of Lake Baikal), the Irkut, Middle Tunguska, and Lower Tunguska. Nordenskjöld's voyage in the summer of 1875 from Tromsø to the mouth of the Yenisei opened up a trade by sea with northern Siberia, in which a number of vessels are now engaged, finding six weeks in summer when the passage to and from the Yenisei can be made with little difficulty.

Yeniseisk, yĕn-ĕ-sā'ĭsk, Siberia, (1) a town in the government of the same name on the left bank of the Yenisei, 200 miles north of Krasnoiarsk. It has several churches, a monastery, museum of natural history and archæology, and a public library. It is in the northern gold-mining region, has a custom-house, an extensive trade, particularly in furs, and an annual fair. Pop. (1897) 11,739. (2) A province in the government of Irkutsk, bordering on the Arctic Ocean, bounded east by Yakutsk and Irkutsk, south by Mongolia, and west by Tomsk; area, 987,186 square miles; capital, Krasnoiarsk. The south part of the province is occupied with the Altai Hills and their offsets. In the Yenisei valley considerable tracts are under tillage, but north of the town of Yeniseisk this is succeeded first by pasturage, then by stretches ever more and more desolate, to the frozen tundras. The chief river is the Yenisei. Smaller streams are the Taimyr, Katanga, and Anabar, which, like the Yenisei, form great gulfs at their mouths. The gold washings of Yeniseisk occupy 12,000 to 15,000 men and several thousand horses. Of the native tribes, who live by hunting, fishing, and trade in fur, the chief are Samoyedes and Tungus. Pop. (1897) 559,902.

Yeo, yō, **Sr James Lucas**, English naval officer: b. Southampton, Hampshire, 1782; d. at sea 1818. Entering the navy at 11 he was present at the siege of Genoa in 1800, and while in command of a force of English and Portuguese captured Cayenne, French Guiana. In 1813 he became commander-in-chief of the English naval force of the Great Lakes and soon came into conflict with the American ships of war there. After several indecisive engagements he captured Oswego, 6 May 1814, which the Americans soon retook, and afterward blockaded Commodore Chauncey at Sackett's Harbor. In the following year Yeo was made commander-in-chief of the English fleet on the west coast of Africa.

Yeoman, yō'man, a term of early English origin formerly applied to a feudal attendant or servant, but in the 15th century and subsequently denoting a small freeholder below the rank of gentleman. The term yeoman was given also to the 40 shillings freeholder, and commonly to any small farmer or countryman above the grade of laborer. The term is also familiar in the titles of functionaries in royal households, such as yeoman usher of the black rod, yeoman of the robes, etc.

Yeomanry, a force of volunteer cavalry first enrolled in Great Britain during the wars of the French Revolution, and consisting to a great extent of country gentlemen and farmers possessing their own horses and requisite equipment. They are liable to be called out in aid of the civil power in case of riot at any time; in case of actual invasion, or the appearance of an enemy on the coast or during a rebellion, they may be assembled for actual service; they are then subject to the Mutiny Act and Articles of War, and may be called upon to serve in any part of Great Britain. During permanent service they receive cavalry pay and an allowance for forage. They undergo six days' training, and must attend a certain number of drills yearly, for which they receive 7s. a day as subsistence allowance, and 2s. for forage. Arms and ammunition are provided by the War Office, and there is an annual allowance of £2, or about \$9.74, per man; but each man has to provide his own horse, which is exempt from taxation. For their services during the Boer war, 1899-1902, they received the title of Imperial Yeomanry. Colonial Yeomanry have been enlisted for the defense of the British colonies.

Yeomen of the Guard, in England, a corps of veteran soldiers of stately presence, employed on state occasions in conjunction with the gentlemen-at-arms as the bodyguard of the sovereign. The yeomen were constituted a corps in 1485 by King Henry VII., and they still wear the costumes of that period. The officers of the corps are a captain, ordinarily a peer, a lieutenant, and an ensign — all old army officers. There are also a "Clerk of the Cheque" and four "Exons," besides non-commissioned officers (messengers, sergeant-majors, yeoman bed-goers, yeoman bed-hangers), and 100 privates. The Beef-Eaters or Warders of the Tower, are, contrary to common belief, an entirely different corps, but since the reign of Edward VI. have been privileged to wear the yeoman's uniform, without the shoulder belt. See BEEF-EATERS.

Yerba Maté, yĕr'ba mā'tĕ. See PARAGUAY TEA.

Yerkes, yĕr'kĕz, **Charles Tyson**, American capitalist: b. Philadelphia, 25 June 1837. He received a secondary education in Philadelphia, was for a time in the flour and grain business, in 1859 became a stock-broker, and in 1861-86 was in banking, first in Philadelphia, and from 1881 in Chicago. In 1871 he was obliged to make an assignment, but by fortunate investments he soon financially re-established himself, and became prominently connected with the Philadelphia street-railway system. After his removal to Chicago he acquired a controlling position in its street-railway system. In 1892-3 he was a prominent member of the board of directors of the World's Columbian Exposition at Chicago, rendering particular service to the

YERKES OBSERVATORY — YEZO

department of fine arts, to whose exhibit he loaned his fine collection of paintings. Among his later enterprises was that connected with the London system of underground railways. He gave to the University of Chicago funds for the buildings and instruments of the Yerkes Observatory (q.v.), with its famous telescope. This was described by Newcomb as "one of the most munificent gifts ever made for the promotion of any single science."

Yerkes Observatory. See CHICAGO UNIVERSITY; YERKES, CHARLES T.

Yew, evergreen coniferous shrub or tree, of the genus *Taxus*. The leaves are flat needles arranged in two ranks to the right and left of the stem, but in a horizontal plane. The flowers are diœcious, and have no perianth; the male inflorescences are composed of a few stamens partly united at the apex of a scaly, axillary stalk, with shield-shaped bracts forming a spherical head. The female flowers are axillary, naked ovules seated on a fleshy annular disk, which becomes cup-shaped and scarlet, and nearly encloses the bony seed. The European yew, a tree famous in the annals of Old World gardens, is the *Taxus baccata*. It is readily recognizable, by its lustrous foliage, so dark a green as to appear velvety, and almost black, in the shadows. When rather young the typical yew has a broadly pyramidal head, but in its old age it becomes ragged and broken, not unlike an aged hemlock. Some of them have attained to a great age, and they reach to a height of 100 feet, and sometimes to a diameter of 10 feet. Yews grow readily in England and France, and their unbending, stately, somewhat sombre habit make them fit to take the place in northern formal gardens which in Italy is filled by the cypress. Long avenues, like that at Hampton Court, hedges, bowers, and wind-breaks, are formed of yew, often clipped into simple shapes, or elaborate topiary designs, in the same way as is box. In cultivation there are several varieties of yew, including the Irish with fastigate branches, and columnar habit, and the golden yews, with foliage which, to a certain extent, is yellow. The dark yew was a favorite tree for planting in church yards, either for its shelter, or possibly for its wood. It is even now a common plant in European cemeteries, and has been for centuries a symbol of mourning at funerals, and especially at those of unhappy lovers,

Lay a garland on my hearse
Of the dismal yew;

This couplet in the 'Maid's Tragedy' is an allusion to this custom. In India the yew is a sacred tree, its wood and gum being burned as an incense, and branches of it carried before ceremonial processions. Although the sweet and juicy scarlet aril of yew fruit does not seem to be poisonous, the enclosed seed is regarded with suspicion, especially when eaten by children, in any quantity. Young branches of yew, too, are dangerous to cattle, which are not seldom killed by feeding upon them. The trunks of yews are twisted, ridged, and gnarled, and the shreddy bark has the rich red-brown tone of an old cedar. The wood is hard, with an orange red or brown heart, which takes a fine polish and is valued for cabinet work and veneers; since it is also fine and close-grained,

flexible, and elastic, easy to split and durable, yew-wood was the chosen material for the bows of the English archers, and no other wood has ever equaled it for that purpose. The Indian tribes of the northwestern American coast arrived at the same conclusion in regard to the beautiful *Taxus brevifolia*, indigenous to that region, and similar in appearance and size to the European tree. It was used by them for bows, spear-handles, paddles, and fish-hooks, and is the most durable timber that the white man can find for his fence-posts. There is another arborescent American yew, found in Florida, a bushy tree (*T. floridana*) with many stout spreading branches and a short trunk. It rarely exceeds 30 feet in height. A Japanese species (*T. cuspidata*), with a bright red bark, is now being introduced to cultivation, and is of bushy habit, and more hardy and successful than the European yew. This is a great favorite with the Japanese, who clip it into fantastic shapes. The most familiar yew in Canada and the eastern United States is the *T. canadensis*, a very low, shrubby species with decumbent branches radiating in every direction and forming thickets hard for a man to travel through, but a first-rate cover for grouse. It grows in moist lands under the shade of trees, and is readily recognized by its dark foliage and the glowing, crimson, oblong, cup-like fruits.

Yezd, yēzd, or **Yazd**, Persia, (1) A town, capital of a province of the same name, in an oasis in a sandy plain, 190 miles southeast of Ispahan. It is about five miles in circuit; consists of an old town, enclosed by a wall and ditch, defended by a citadel, and entered by four gates; and of a larger new town or suburb, which has risen up in a straggling manner, to meet the wants of the increasing population. Within the citadel are a palace, the principal mosque, several other public buildings, and the residences of the chief men of the district. The bazaars are spacious and well supplied, particularly with the staple manufactures of the town itself, consisting of silk stuffs, velvets, cottons, coarse woollens called *numuds*, loaf-sugar, and sweetmeats. The position of Yezd, on the edge of a desert, at the junction of the principal caravan routes, makes it an important commercial entrepôt for the surrounding countries. Pop. 40,000, of which about a tenth are Zoroastrians or fire-worshippers. (2) The province has an area of about 20,000 square miles, and its population is estimated at 100,000.

Yezedees, yēz'ē-dēz. See RELIGIOUS SECTS.

Yezo, yāzō, **Ezo**, or **Hokkaido**, hōk-kī'dō, Japan, the northernmost of the four main islands of the empire, separated from Hondo on the south by Tsugaru Strait, from Sakhalin on the north by La Pérouse Strait, while Yezo Strait divides it from Kunashiri, the southernmost of the Kurile Islands; area, including dependent islands, 36,300 square miles. The capital is Sapporo; Hakodate, Mororan, and Otaru are other large towns and open ports. Yezo is curiously like a skate-fish in shape. The centre of the island is but little known, though it has been crossed twice or thrice by Japanese and European explorers. It is traversed by chains of mountains, the principal summits being Tokachi-dake, 8,200 feet; Shribetsi-yama, 7,874 feet; Ishikari-dake, 7,710 feet; Sapporo-dake, 6,500 feet; and Komaga-take, 3,830 feet. Much

of the island is volcanic, especially in the east. The chief rivers are the Ishikari and Teshio, flowing into the Sea of Japan; and the Tokachi, flowing into the Pacific Ocean. The chief bays are Volcano Bay, in the south; Ishikari Bay, in the west; Shari and Walfish bays, in the northeast. Yezo has a rigorous climate, being for six months of the year under snow and ice, two feet in the south to eight feet in the north. The original inhabitants of Yezo were probably pit dwellers, of whom distinct traces have been found at Sapporo, Nemuro, and elsewhere. After these came Ainos or Ainus, whose principal settlement is at Piratori, 50 miles east of Mororan. The bear festival in September is the great event of their year. The Ainos number 15,000, a population either stationary or decreasing; they are harmless, lazy, and drunken, and live mostly near the mouths of the rivers. The southern corner of the island was wrested from them in the 16th century, and Matsumae, now Fukuyama, in the extreme southwest, became in the next century the headquarters of Japanese rule. At the restoration in 1868 the supporters of the Tokugawa government made a last stand here, and were finally defeated at Hakodate. The fauna and flora of Yezo differ materially from those of the main island, the bear being a different species, resembling the grizzly. There are no monkeys; a species of grouse is found. The deer, once very plentiful, are now comparatively scarce. The Yezo pony, originally from Nambu on the main island, is hardy, and foreign blood has been introduced, promising good results. The forests furnish valuable timber. Coal, petroleum, and gold are found and worked to some extent. The official name Hokkaido, or "Circuit of the Northern Sea," was bestowed in 1870, when it was brought under a special colonization department. An agricultural mission from the United States assisted in founding model farms, laying out roads, and building bridges. The capital was changed from Matsumae to Sapporo, which was provided with a railroad to Otarunai, its port, and to Poronai, the great coal district inland. An agricultural college, breweries, canning factories, beet-root sugar factories, etc., were established. The coal mines are worked by convict labor. A system of military settlements has of late years been put into force, partly with the view of furnishing a militia against possible invasion from Russia, which is supposed to covet the fine harbors of Yezo. The sheltered harbor of Mororan, on Volcano Bay, is now a naval harbor, to which a railway from Poronai mines has been built. The principal products of Yezo are coal, seaweed, sulphur, fish, the catches of salmon on the river Ishikari being sometimes enormous. Kerosene, beer, glass, and other articles are manufactured, and internal communication is facilitated by a system of railways, either constructed or projected, joining all the important coast and interior towns. Pop. (1898) 605,742, including 17,573 Ainos; of the administrative division, including the Kurile Islands, 610,155. See JAPAN.

Yggdrasil, ȳg'drā-sīl, or **Ygdrasil**, in Scandinavian mythology, the giant ash tree overspreading the whole world and reaching above the heavens. It binds together, earth, heaven, and hell, and its roots stretch out to the

Asa or Æsir gods in heaven, to the frost giants, and to the under world. A marvellous fountain springs up under each of these three great roots and in the tree, whose boughs drip continually with honey, dwell an eagle and the squirrel Ratatöskr. At its roots the serpent Nithögg gnaws, and between the serpent and the eagle runs the squirrel constantly endeavoring to provoke the two to strife. Certain writers detect in this myth a distortion of the story of the Cross, but the translator of Grimm says, "it were a far likelier theory, that floating heathen traditions of the world tree, soon after the conversion in Germany, France, or England, attached themselves to an object of Christian faith just as heathen temples and holy places were converted into Christian ones."

Ying-tse, yīng'tsĕ', China. See NI-CHUANG.

Ylang-ylang, **Attar of**, a perfume fully as exquisite and as precious as the much-praised attar of roses. The ylang-ylang tree attains a height of 60 feet and has drooping, greenish-yellow flowers three inches long and extraordinarily fragrant. The tree is common in the Philippines. It is found chiefly in the well-populated provinces and islands, and the natives say that it thrives best near the habitations of man. The propagation in plantations, by seed or cuttings, about 20 feet apart each way (108 trees to the acre), is easy, and the growth rapid in almost any soil. The first flowers appear in the third year, the eighth yielding as high as 100 pounds, the bloom occurring every month. The greatest yield is from July to December. The process of converting the long, greenish yellow, fragrant petals of the flower into essence is by the simplest form of distillation, using merely water and the choicest flowers. No chemicals of any kind are required.

Ymir, ē'mīr, in Scandinavian mythology, the personification of Chaos, or the first created being, produced by the antagonism of heat and cold in Ginnungagap, the primeval abyss. Slain by Odin and thrown into Ginnungagap, his flesh was transformed into land, his bones becoming the mountains, his blood the rivers and lakes, his hair the forests, while his skull constituted the heavens, and his brains the clouds.

Yoder, yō'dēr, **Robert Anderson**, American Lutheran clergyman and educator; b. Lincoln County, N. C., 16 Aug. 1853. Graduated from North Carolina College in 1877, he was ordained to the ministry of the Lutheran Church in 1879, and, after study at the seminary of the Church in Philadelphia, held pastorates in North Carolina. From 1888 to 1891 he was president of Concordia College (Fort Wayne, Ind.), and in 1891 became president of Lenoir College (Hickory, N. C.). He was also chosen pastor of St. James' Church at Newton, N. C., and in 1902 was president of the United Synod of the South at Charleston.

Yoga, yōgā, one of the six schools or systems of Brahmanical philosophy, that of Patanjali, the essence of which is meditation. It believes in a primordial soul which has had existence from an earlier period than primeval matter, and holds that from the two arose the spirit of life (Mahanatma). Theoretically at least, its devotees can acquire even in this world entire command over elementary matter by cer-

tain ascetic practices, such as long continued suppression of the respiration, inhaling and exhaling the breath in a particular manner, sitting in 84 attitudes, fixing the eyes on the tip of the nose, and endeavoring, by the force of mental abstraction, to unite themselves with the vital spirit which pervades all nature and is identical with Siva. When this mystic union is effected, the Yoga can make himself lighter than the lightest, or heavier than the heaviest substance, or as small or as large as he pleases; he can traverse all space, can become invisible, can equally know the past, the present, and the future, and can animate any dead body by transferring to it his own spirit; finally he becomes united with Siva, and is exempt from the necessity of undergoing further transmigrations. See BRAHMANAS.

Yoke, a piece of timber, hollowed or made curving near each end, and fitted with bows for receiving the necks of oxen, by which means two are connected for drawing. A frame of wood fitted to a person's shoulders for carrying a pail, etc., suspended on each side. The ancients regarded the yoke as a symbol of slavery, and it was customary for vanquished armies to pass under a yoke, formed like a gallows, of two upright spears, and a third fixed transversely at top.

Yokohama, yō-kō-ha'ma, Japan, the chief seaport and treaty-port of the empire, on the Bay of Tokio, about 17 miles southwest of Tokio, of which it is the port. Yokohama is of modern growth, its rise being due to the opening of Japan to foreign commerce and to the establishment here of foreign merchants, consuls, etc., after the adjacent Kanagawa was declared a treaty-port. It is in general poorly built, with houses mostly of wood. The dwelling-houses and warehouses of the foreign residents, however, are of a superior character, and are built on the bluff facing the bay. The commercial buildings occupy the east of the town, the western part being the Japanese town, and the centre being occupied by the prefecture, custom-house, post-office, and other official buildings. The bay is very beautiful, and, though only an open roadstead, affords a good and commodious anchorage, not only to extensive mercantile shipping, but also to the naval squadrons of Great Britain, France, Germany, Russia, and other powers. Work on a large harbor was carried out in 1889-96, the main object of which was to prevent the gradual silting up of the anchorage; it is enclosed by two breakwaters $1\frac{1}{4}$ miles long, and an iron pier, 1,900 feet long, connected with the railway to the capital, 17 miles off. Yokohama is a centre for tourists visiting Japan. The imports into Yokohama in 1901 were valued at \$45,186,375, mainly sugar, metals and metal manufactures, cotton manufactures, kerosene, raw cotton, and woollens; the exports at \$68,305,235, mainly raw and manufactured silk, copper, tea, fish, cotton goods, fish-oil, and paper. The number of vessels entered in 1901 was 823, with a tonnage of 2,032,445, mainly British, Japanese, German, and American. Pop. (1902) 267,550.

Yokosuka, yō'kō-soo'kā, Japan, town and naval station on the Bay of Tokio, 12 miles south of Yokohama. It is connected with Yokohama by rail and steamer, and with Kama-

kura and Tokio by rail. It has a spacious land-locked harbor, large dry docks, a naval arsenal, and ship-building yards suitable for the construction of large war vessels. About a mile from the town is the grave of Will Adams (q.v.), the first Englishman to enter Japan. Pop. (1898) 24,750.

Yokuts ("Indians"), a group of about two dozen small tribes, forming the Mariposan linguistic stock of North American Indians, occupying an irregular area in central southern California from Fresno River in the north to near the southern extremity of Tulare Lake in the south, and between the Sierra Nevada in the east and the Coast Range in the west; also a strip, 10 to 20 miles wide, extending southeastward from Tulare Lake along the eastern base of the latter range to Mount Pinos, about lat. $34^{\circ} 45'$, together with an isolated area, occupied by the Cholovone division, in San Joaquin Valley from the Tuolumne northward. The tribes in general were segregated by the natural features of their territory, such as river valleys, and each tribe had its hereditary chief. Their villages consisted of a single row of tule-thatched, wedge-shaped houses, with a continuous *ramada* or shelter of brush along the front. In early times, when large game was abundant, hunting formed an important pursuit, but with the coming of the whites and the disappearance of the game they were compelled to resort almost exclusively to the products of the soil and of the streams and lakes, although rabbits and quail were always abundant and were commonly trapped. Seeds of various kinds were gathered for use as food, as also were grasshoppers, caterpillars, worms, and the larvae of insects; dogs were raised for use also as food, and even skunks were not despised; but the coyote and the rattlesnake were always tabooed. Their basketry was excellent in shape, design, and execution, and formed their chief handicraft. The Yokuts women were chaste before the settlement of their country by the whites; marriage was perhaps by purchase, the husband residing at the house of his wife; infanticide was practised in cases of deformity; the dead were generally cremated. The Yokuts are now but a remnant of a once comparatively populous group of tribes. Early warfare with the Paiutes, who pressed them closely from the east, and later and more disastrous contact with white ruffians who found the Indians in their way, practically exterminated many of the tribes and probably wiped others away completely. Their present population is not known, but there are believed to be about 150 under the Mission Agency, and others are scattered over their old haunts, some of the tribes being represented by only half a dozen individuals or less.

F. W. HODGE,

Of the Smithsonian Institution.

Yon, yôn, **Edmund Charles**, French artist: b. Paris 2 Feb. 1836; d. there 26 March 1897. He was a pupil of Puget and Lequeim. His first work was a series of wood engravings after Millet and others. He later gave his attention mainly to landscape painting. His works include 'A Road in Velizy'; 'The Banks of the Marne'; 'Before the Rain'; 'The Squall'; 'Morning'; and 'San Marco.' His paintings are distinguished for delicacy of coloring and shading.

YONGAMPO — YONKERS

Yongampo, yŏn-gām'pō, Korea, a seaport on the left bank of the Yalu estuary, near Wiju, with a large and important harbor. It was used as a landing place by the Japanese during the Chino-Japanese war in 1894, and just prior to the Russo-Japanese war of 1904 was an important outpost of the Russian advance into Korea, and the headquarters of their timber-felling concession. Russia's strong protests against opening the port to foreign trade was one of the many events that hastened the war.

Yonge, yŏng, **Charles Duke**, English historian: b. 1812; d. 1 Dec. 1891. He published: 'An English-Greek Lexicon' (1849); 'A New Gradus ad Parnassum of the Latin Language' (1850); 'History of the British Navy' (1863); 'France Under the Bourbons' (1866-7); 'Three Centuries of English History' (1872); 'Three Centuries of English Literature' (1872); 'A Life of Marie Antoinette, Queen of France' (1876); 'Life of Sir Walter Scott' (1888); etc.

Yonge, **Charlotte Mary**, English author: b. Otterbourne, Hampshire, 11 Aug. 1823; d. there 24 March 1901. She received a private education. She made her name widely known by the publication in 1853 of a novel entitled 'The Heir of Redclyffe,' which exercised an important influence on some leading minds of that time. She devoted part of the proceeds to fitting out a missionary ship for Bishop Selwyn. None of her later novels came up to the standard of her first work. Among the best of them are 'Katharine Ashton'; 'The Daisy Chain' (1856), the proceeds of which she devoted to founding a missionary college at Auckland, in New Zealand; 'Hopes and Fears'; 'The Little Duke'; 'The Prince and the Page'; and 'The Dove in the Eagle's Nest.' Her staunch attachment to the Church of England more or less colors all these works, and was also manifested, not only in the field of practical effort, but in the choice of the subjects of some other of her works, such as: 'Biographies of Good Women' (1862); 'Life of Bishop J. C. Patteson' (1873); 'John Keble's Parishes' (1898); and 'The Patriots of Palestine' (1908). Her remaining works include: 'Christian Names: their History and Derivation' (1863); 'Cameos from English History' (1869-99); 'History of Germany' (1877); 'History of France' (1879); 'Universal History for Young People.' For 30 years she edited a High Church magazine known as 'The Monthly Packet.' An illustrated edition of her more popular works in fiction appeared in 1888-9. Consult the 'Life' by Coleridge (1903).

Yonkers, yŏnk'érz, N. Y., city of Westchester County; on the Hudson River, and on the New York Central Railroad; north of and adjoining New York city. It has regular steamer connection, for passengers and freight, with New York and Albany, and is connected by electric lines with New York, Mount Vernon, New Rochelle, and many of the villages and cities on the Hudson.

Industries.—The good opportunities for shipment of goods by land and water have aided the industrial growth of the city. In 1900 (government census) Yonkers had 387 manufacturing establishments, capitalized for \$13,097,205 and employing 8,615 wage-earners, to whom were paid annually \$3,888,892. The total cost of material used each year, and including rents,

fuels, etc., was \$10,555,218. The value of the yearly products was \$19,580,324. The chief industries were 12 foundries and machine shops, capitalized for \$1,012,892 and producing annually goods to the amount of \$1,381,903; the annual output of patent medicines and compounds was valued at \$744,784. Other manufactures are confectionery, furniture, roofing materials, carpets, rugs, and hats. There are large coal yards, grain elevators, the Otis Elevator Company works, ship and boat building yards, bridge works, lumber mills, flour and grist mills, and carriage and wagon factories.

Municipal Improvements and Buildings.—Yonkers is built on a series of terraces which rise from the Hudson to an elevation of 420 feet above tide-water. The view from the elevated portions includes a long distance up and down the Hudson, the Palisades, and the beautiful valley to the east. In the residential part of the city are the homes of many New York city business men. The city has a frontage of nearly five miles on the Hudson, and extends along the Bronx River for about seven miles. The streets are broad, many of them paved, and well shaded. The city owns and operates the water-works. There are three small public parks maintained by the city, also two public bath houses, and, on the Hudson, a steel pavilion for recreation. There is an excellent sewer system. The principal public buildings are the government building, the library in Washington Park, the churches, schools, and charity institutions. The city-hall is of considerable historic interest; it was formerly the Philipse Manor and was built in 1752. Since 1868 it has been used as a municipal building. Another noted building is "Grey-stone," once the residence of Samuel J. Tilden.

Churches, Charitable, and Educational Institutions.—There are 30 churches, some of which are buildings of considerable architectural merit. The city has the Homœopathic Hospital, Saint John's Riverside Hospital, Saint Joseph's Hospital, Leake and Watts Orphan Home, the Hebrew Home for the Aged and Infirm, and private institutions. The educational institutions are Lowden and Halsted schools, Spencerian Business College, a public high school, established in 1882, public and parish elementary schools and kindergartens, a public library (building presented by Andrew Carnegie), the Hollywood Inn for Workingmen, with a library of 6,000 volumes, the Woman's Institute Library, and Saint Joseph's Training School for Nurses. Near the city limits are Saint Joseph's Seminary (q.v.), and Mount Saint Vincent Academy (R.C.). The latter is a school for girls.

Banks and Finances.—There are two national and three state banks. In 1903 the combined deposits amounted to \$9,920,900. The expenditures for municipal maintenance and operations are annually about \$1,000,000. The chief items of expense are: for schools, about \$248,000; police department, \$91,000; fire department, \$74,500; interest on debt, \$144,500; municipal lighting, \$98,500; water-works, \$80,000; and streets, \$56,000.

History.—In 1650 Adrian Van der Donck and several Dutch families settled in what is now called Yonkers. The region around Yonkers then belonged to the Dutch. It became a part of Philipse Manor in 1672 and the town was called Philipsburg. The town of Yonkers

YONNE—YORK

was founded in 1788, and in 1855 it was incorporated as a village. The town was divided in 1872; the northern part was chartered as the city of Yonkers and the southern part was called Kingsbridge. In 1874 Kingsbridge became a part of New York city. Pop. (1890) 32,033; (1900) 47,931; (1903, est., Gov. Report) 52,701.

Consult: Scharf, 'History of Westchester County'; Allison, 'The History of Yonkers' (1896).

Yonne, yŏn, France, a northern interior department bounded by Seine-et-Marne, Aube, Côte-d'Or, Nièvre, and Loiret; area, 2,868 square miles; capital, Auxerre. The surface is generally intersected by low hills, sometimes barren, but usually covered with fruitful vineyards, which yield the famous Chablis, Joigny, Auxerre, and Tonnerre wines. Between the hills lie beautiful and productive valleys. The most elevated land is in the southwest, forming the water-shed between the basins of the Loire and Seine. The small part belonging to the former is drained by the Veille. All the rest belongs to the latter, which receives it chiefly by the navigable Yonne. The climate is temperate, and the air pure and healthful, except in some wet, marshy spots. The minerals include iron, red and yellow ochre, building-stone, lithographic stones, pavement, and potter's clay. The manufactures are of coarse woollens, woolen covers, serge, gluc, etc. The trade is in corn, wine, vinegar, wood and charcoal, ship-timber, wool, cattle, iron, and ochre. Pop. (1901) 321,062.

Yousufzaye, yoo-soof'zī, or **Yusufzai** ("children of Joseph"), an important Afghan tribe, on the northwest frontier of India. Their territory includes about 2,000 square miles within the British district of Peshawur and also the hills beyond the north boundary, and their total number is estimated at 246,000, including 73,000 soldiers. The crops of the region are wheat, barley, millets, maize, cotton, and mustard seed. Iron, cattle, and wool are exported, and the transit trade is considerable.

Yor'ick, (1) The king's fool, whose skull is apostrophized by Hamlet in the fifth act of Shakespeare's tragedy of 'Hamlet.' (2) The pseudonym adopted by Laurence Sterne in 'A Sentimental Journey.' (3) The parson in Sterne's 'Tristram Shandy,' intended as a portrait of himself.

Yoritomo Minamoto, yō-rē-tō'mō mē-nā-mō'tō, Japanese soldier and statesman: b. 1146; d. 1199. He became about 1159 the leader of the military clan of Minamoto in its feud with that of Taira. In 1180 he assembled an army of considerable strength, and began operations against the Taira, whom in 1185 he completely destroyed in the naval battle off Dan-no-ura, not far from Shimonoseki. He became practically ruler of Japan, though nominally subject to the Mikado, was made (1192) Sei-i-tai sho-gun, established his capital at Kamakura, and laid the basis of the feudal system of Japan.

York, Cardinal. See STUART, HENRY BENEDICT MARIA CLEMENT.

York, Duke of, a title formerly conferred on the second sons of the kings of England. It was first borne, however, by EDMUND DE LANG-

LEY, fifth son of Edward III., who was created Duke of York in 1385, and died in 1402. He was the founder of the house of York, in English history that of the "white rose," while his elder brother John, fourth son of Edward III., created Duke of Lancaster in 1362, was the founder of the rival house of Lancaster, or the "red rose"; and their claims were contested for nearly half a century in the so called Wars of the Roses. The first Duke of York was succeeded by his son EDWARD, who fell at Agincourt in 1415, and was succeeded by his nephew RICHARD, son of Anne Mortimer, who was grand-daughter of Lionel, Duke of Clarence, third son of Edward III. It was by virtue of this descent from the Duke of Clarence that the house alleged its superior right over that of Lancaster, which was descended from the fourth son of Edward III. The title was subsequently borne by Edward Plantagenet, afterward Edward IV.; by Richard Plantagenet, supposed to have been murdered in 1483 by his uncle Richard III.; by Henry Tudor, afterward Henry VIII.; by Charles Stuart, afterward Charles I.; by James Stuart, afterward James II.; and was conferred by the pretender, James III., on his second son Henry Benedict, known in history as Cardinal York, the last of the royal family of the Stuarts. After the accession of the house of Hanover to the British throne, George I. created his brother ERNEST AUGUSTUS Duke of York and Albany (1716). He died in 1728, and the title was held by EDWARD AUGUSTUS, the second son of Frederic, prince of Wales, and FREDERIC, second son of George III., who was made commander-in-chief of the British army, but showed little ability. The title was in abeyance until 1892, when it was conferred on Prince George Frederick Ernest Albert.

York (British, *Cacr Ebroc*; Latin, *Eboracum*), England, an archiepiscopal city and civic county, capital of Yorkshire, 196 miles north-northwest from London by rail, at the confluence of the Foss with the Ouse. It consists of the city proper, and of suburbs, some portions of which are situated across the Foss, and communicate with the rest by several bridges. The city, with a circuit of nearly three miles, is enclosed by ancient double walls, originally Roman, but restored by Edward I., and partly repaired at subsequent periods; the portions which still remain have been converted into promenades, commanding a beautiful prospect of the surrounding country. York is entered by four imposing gates; and is built for the most part in narrow irregular streets, many lined with houses of antique appearance. Improvements have modernized many of the older parts of the city, and many handsome ranges of new buildings have been erected. The minister or cathedral dates from the 7th century, but did not begin to assume its present form till 1171, and was not completed till 1472. A square massive tower rises from the intersection to the height of 235 feet, and two other lofty towers of graceful proportion, 196 feet, flank a richly-decorated western front, divided by paneled buttresses into three compartments, of which that in the centre is chiefly occupied by a beautiful window and a splendid portal. Measured without the walls, the whole length, from east to west, is 524 feet, and the width across the

YORK

transepts, north to south, 222 feet; length, from west door to choir, 264 feet; length of choir, 162 feet; breadth of body and side aisles, 109 feet. The interior consists chiefly of a lofty nave, separated from its aisles by long ranges of finely clustered columns, a still loftier choir, lighted by a magnificent and beautifully blazoned window, and a lady-chapel continuing the choir, and containing some beautiful monuments. The cathedral has twice sustained serious damage and narrowly escaped total destruction from fire, caused in 1829 by an incendiary lunatic, and in 1840 by the negligence of a workman engaged on its repair. The chapter-house, entered from the north transept of the cathedral, is a richly decorated octagon, and near it is a fine old chapel, originally forming part of the old archiepiscopal palace, and now appropriated to the library. York possesses many other places of worship, including a beautiful Roman Catholic pro-cathedral; and collegiate, grammar, blue-coat, gray-coat, and board schools. Other notable buildings and establishments are an ancient Gothic guildhall (1446), and spacious mansion-house adjoining; the fine old ruins of St. Mary's Abbey; Clifford's Tower, part of the city castle founded by the Conqueror; the fine old merchants' hall; county assize courts; city courts of justice in the late Gothic style (1802); the museum of the Yorkshire Philosophical Society, assembly-room, masonic hall, baths, art-gallery, free library, the Yorkshire Club-house, concert rooms, two theatres, cemetery, lunatic and blind asylums, dispensary, county hospital, cattle market, almshouses, and numerous other charities. The railway station is one of the finest in the kingdom. The manufactures include iron castings, bottles, leather, flour, cocoa, and confectionery. York ranks second among English cities, its archbishop having the title of Primate of England (see ARCHBISHOP); its chief magistrate takes the title of lord-mayor. It is the headquarters of the North-Eastern Railway Company, and contains their carriage and wagon shops. There is communication by water with Selby, Goole, Hull, etc. York was the early British *Caer Eborac* of the Brigantes and under the Romans as *Eboracum* became their principal seat of power in the north, if not in the whole country. Here died the Roman emperors Severus and Constantius Chlorus, and here it is popularly (but incorrectly) supposed Constantine the Great was born. After their departure it so far retained its importance as to become the capital of Northumbria, whose king, Edwin, in 624 made it an archiepiscopal see. In the 8th century its diocesan school attracted students not only from all parts of the kingdom, but from France and Germany, and sent out scholars who afterward acquired European celebrity. Here the first English Parliament was held by Henry II. in 1160. In after-times it makes a distinguished figure in almost all the great epochs and events of English history, during the Civil War surrendering to the Parliamentarians after a siege of several weeks, subsequent to their victory at Marston Moor in the vicinity. Among its distinguished natives are Alcuin, the tutor to the family of Charlemagne; Flaxman the sculptor; and William Etty the painter. Pop. (1901) 77,793.

York, Maine, town, port of entry, York County; on York River, and on the Boston &

Maine Railroad; about 45 miles south by west of Portland and 100 miles southwest of Augusta. It is in an agricultural region, but is known as a favorite summer resort. It has a number of buildings of historic interest, among which is the jail, which is one of the oldest in the country. It contains several villages in which are many summer cottages. The national bank in the village of York has a capital of \$50,000. The town was set off, in 1622, from land granted by the Plymouth Council to John Mason and Ferdinand Gorges. In 1624 the place was called Agamenticus. On 1 March 1640, a territory of 21 square miles was incorporated as a borough by Gorges, and chartered as the city of Georgeana in 1642. This was the first municipal corporation made by the English in North America. On the death of Charles I., in 1649, Georgeana City, Isle of Shoals, Wells, and Kitterytown united and established a confederacy. In 1652 the confederacy, and all of Maine came under the control of Massachusetts. The city charter of Georgeana was revoked, and the name changed to York. The limits of the present town are about as in 1652. In the early years the town suffered from Indian depredations; one attack, in 1692, resulted in the massacre or capture of about one half the inhabitants. Pop. (1890) 2,444; (1900) 2,668. Consult: Emery, 'Ancient City of Georgeana and Modern Town of York'; Baxter, 'Sir Ferdinand Gorges and His Province of Maine' (1890).

York, Neb., city, county-seat of York County; on the Chicago, Burlington & Quincy, the Saint Joseph and Grand Island, and the Freemont, Elkhorn & Missouri Valley R.R.'s; 50 miles west of Lincoln. It was settled in 1871 and in 1880 was incorporated. It is in an agricultural and stock-raising region, and its industries are connected chiefly with farm products. It has a flour mill, machine shop, foundry, large stock yards, and grain elevators. The educational institutions are York College (U. B.), opened in 1890; a high school, established in 1880; Holy Family Academy (R. C.); public and parish elementary schools and public and school libraries. The two national banks have a combined capital of \$150,000. Pop. (1890) 3,405; (1900) 5,132.

York, Pa., city, county-seat of York County; on the Condorus Creek, and on the Pennsylvania, the York Southern, the Northern Central, and the Western Maryland R.R.'s; about 28 miles southeast of Harrisburg, and 95 miles west of Philadelphia. It is in a productive farming section and has considerable manufacturing interests.

Industries.—In 1900 (government census) the city had 464 manufacturing establishments, capitalized for \$9,640,784. There were 404 officials and clerks whose salaries were \$438,281 per annum, and 7,785 wage-earners who received \$2,679,175 per annum. The total cost for material, rent, power, and heat, each year, was \$6,078,070, and the value of the finished products was \$11,961,706. The foundry and machine finished products amounted, each year, to \$2,654,772; and the tobacco products to \$1,190,155. Other manufactures of which there are large and valuable outputs annually are agricultural implements, cigar boxes, food products, carriages, wagons, carriage and wagon materi-

YORK—YORKE

als, confectionery, flour and grist mill products, furniture, iron and steel products (including nails, spike, wire nails, etc.), lumber products, paper and wood pulp, shirts, and patent medicines. The vast power generated at Yorkhaven, 11 miles north of York, will greatly increase the manufacturing industries of York. The York Haven Water and Power Company have built a crib dam to obtain a sufficient volume of water to run the large plant intended for the generation of electrical power and the distribution of this power to places in York and adjoining counties. There is an extensive trade in the manufactured products and in general merchandise which is distributed to the villages and towns of a large region.

Buildings and Municipal Improvements.—

The surface is slightly rolling and has sufficient slope to make excellent drainage. The streets are broad and well shaded. The city is laid out in sections or blocks, 520 feet long and 480 feet wide. There are three small but beautiful parks: Highland, Farquhar, and Penn. The principal public buildings are the government building, the court-house, county jail, the Masonic Temple, four market buildings, an opera house, three public halls, and the municipal buildings. There is an excellent water-supply and a good sewerage system.

Churches, Charitable and Educational Institutions.—There are 60 churches, representing 16 different denominations. The principal charitable institutions and hospitals are the city hospital, charity hospital, county almshouse, Children's Home, and private sanatoriums. The educational institutions are York Collegiate Institute (Presb.), York County Academy, founded in 1787, two business schools, Saint Patrick's Academy (R. C.), a public high school, founded in 1870, public and parish schools, a public library, York County Law Library, and Saint John's Church free library.

Banks and Finances.—There are five national, three state, and two private banks. The combined capital of the 10 banks is \$2,238,000; the annual amount of business is \$11,963,412. The municipal expenditures for annual maintenance and operation are about \$205,000. The chief items of expense are: for educational institutions, \$28,000; police department, \$21,000; municipal lighting, \$24,000; fire department, \$14,500; and street department, \$14,800.

Government.—The government is administered under a charter of 1887 which provides for a mayor, whose term of office is for three years, and a city council of 39 members, elected annually in February. The board of education is chosen by popular vote; the other administrative officials are appointed by the mayor subject to the approval of the council.

History.—A permanent settlement was made in 1735 by a German colony; but in 1741 the town was laid out by John, Thomas, and Richard Penn, and incorporated as a borough in 1787. In 1887 York was chartered as a city. In 1749, the first court of general quarter sessions was held here. In 1777 the Continental Congress left Philadelphia, fearing capture by Howe's army, and convened in York 30 September. Congress continued to hold sessions in York until 27 June 1778. Pop. (1880) 13,940; (1890) 20,793; (1900) 33,654; (1903, est. Gov. Report) 36,438. Consult Gibson, 'History of York County.'

York, a river in Virginia, formed by the confluence of the Pamunkey and Mattaponi rivers. It is the tidal estuary of the rivers, which begins at West Point and flows southeast to the Chesapeake Bay. It is 40 miles long and navigable to the head of tide water. At its entrance, on York Spit, is a lighthouse.

York and Lancaster, Wars of. See **ROSES, WARS OF THE.**

York College, located at York, Neb. It was founded under the auspices of the United Brethren in Christ, and was opened to students in 1890. It is under the control of a board of trustees composed of five members at large and representatives of four conferences of the United Brethren. Its organization includes the College, the Preparatory Department, the Normal Department, the Conservatory of Music, the College of Commerce, the School of Shortland, the School of Expression, the School of Art, the School of Telegraphy (organized in 1903), and the Summer School. The college offers classical, philosophical, scientific, and literary courses, and confers the degree of A.B. on the completion of the classical, philosophical, and literary courses, the degree of B.S. for the scientific course. The work of each course is very largely prescribed. The normal department offers a normal course of two years, and a three-years' teachers' course, which is preparatory to the normal course. The degree of bachelor of didactics is conferred on all graduates from the normal course. A model school was established in 1903. The conservatory of music offers courses in piano, voice, and violin, and confers the degree of bachelor of music for graduation from the full courses. The College of Commerce offers a course of one year, and an advanced course of two terms additional; the degree of bachelor of accounts is conferred on graduates from the advanced course. The Summer School courses are intended specially for teachers, and a model school is conducted. Instruction in physical training is given, and an organization of college cadets is maintained for military drill; there is also a field for athletic sports on the campus. The students maintain Young Men's and Young Women's Christian Associations, and two literary societies. The library in 1904 contained 1,500 volumes, the students numbered 301, and the faculty 13. York College is considered one of the leading institutions of higher learning in Nebraska.

York von Wartenburg, yörk fön vār'ten-boorg, **Hans David Ludwig**, COUNT, a Prussian field-marshal: b. Potsdam 26 Sept. 1759; d. Klein-öls, near Breslau, Silesia, 4 Oct. 1830. He entered the army in 1772, but was cashiered for insubordination in 1779, and then served the Dutch in the East Indies 1783-4. He, however, re-entered the Prussian service, becoming a major-general in 1807, and governor of the province of Prussia in 1811. He was especially distinguished during the War of Liberation and the invasion of France (1813-14), was ennobled in 1814, and made a field-marshal in 1821.

Yorke, yörk, **Curtis**, pseudonym of S. RICHMOND LEE, English novelist: b. Glasgow. She is the daughter of J. J. Long and was married to J. W. Richmond Lee, a mining engineer. Among her numerous works may be cited: 'That Little Girl' (1886); 'A Record of Discords' (1894); 'Because of the Child' (1896);

YORKSHIRE — YORKTOWN

'A Flirtation with Truth' (1897); 'A Memory Incarnate' (1902).

Yorkshire, England, the largest county of the kingdom, bounded on the north by the Tees, separating it from Durham, east by the North Sea, south by Lincoln, Nottingham, Derby, and Chester, and west by Chester, Lancaster, and Westmoreland; area, 6,067 square miles. Yorkshire is divided into trithings, or three ridings, respectively the north, east, and west ridings, each riding having a separate lord-lieutenant. The main portion of the county forms a large central valley stretching southeast to the Humber, flanked on one side by the Pennine range and on the other by the Cleveland Hills, and drained chiefly by the Ouse and its tributaries. Considerably more of the North Riding is pasture than under cultivation, but it includes the vale of York, with an area of about 1,000 square miles, in which there is much fertile land growing all kinds of crops. It also includes the Cleveland district, with its great bed of iron ore. In the North Riding is the capital of the whole county, York; Scarborough, a favorite watering-place; and Whitby, famous for its jet. In the East Riding the area under cultivation greatly exceeds that laid down in permanent pasture. Its industrial activity is centred in the great seaport of Hull. In the West Riding the proportion of land laid down in permanent pasture is larger than in any other, being two thirds of that under cultivation. The West Riding has long been famous for its woollen and worsted manufactures, of which it is now the chief seat. Their development has been in modern times aided by the proximity of coal and iron. The great coal field of the West Riding yields not only the Silkstone bituminous coal, most valuable as a house coal, but also the Barnsley thick coal, semi-anthracitic. Leeds produces every variety of woollen goods; Bradford, mixed worsted fabrics and yarns; Dewsbury, Batley, and adjoining districts, shoddy; Huddersfield, plain goods, with fancy trouserings and coatings; and Halifax, worsted and carpets. Barnsley is famous for its linen manufactures, of which Leeds also is a seat, as well as of that of leather. Next to the woollen and other textile industries comes the manufacture of iron and steel machinery, and implements of every description. Leeds is one of the principal seats of all kinds of mechanical engineering, and Sheffield of iron-work and cutlery. Total population of Yorkshire (1901) 3,585,122.

York'town, Va., town, county-seat of York County; on the York River, seven miles from its mouth, and 68 miles southeast of Richmond. It has regular connection with the Chesapeake and Atlantic ports by means of the Old Dominion and other lines of steamers. York is one of the oldest settlements of the United States; it contains the oldest custom-house in the country. It is famous for having been the place where Lord Cornwallis surrendered, and a monument has been erected in honor of the event. In August 1781 Cornwallis, with a force of 8,000 men, took possession of the place, threw up earthworks and fortified the town. He was supported by several British vessels in the York River. Fortifications were erected also at Gloucester Point, opposite Yorktown. Washington left his headquarters on the Hudson on 19 August, and traveled by land to

Philadelphia, then to Elkton, at the head of Chesapeake Bay, and down the bay, arriving at Williamsburg 14 September. His force consisted of 7,000 French under Rochambeau and 9,000 Americans. On 29 September Washington and his men invested Yorktown. He was assisted by a French fleet under Count De Grasse, who blocked the river in such a way that the British were unable to send assistance to the soldiers at Yorktown. Clinton had sent reinforcements to Cornwallis, but De Grasse prevented the landing. The first parallel was established on 9 October, and the Americans opened fire and destroyed some of the British guns. The next day three large transports and a frigate were destroyed. The attack was renewed on the 11th and again on the 14th. On the 17th Cornwallis offered to capitulate, and on the 19th he surrendered. The American loss, including the French, was about 300 killed, wounded, and missing, and the British loss was about 550. This was the last important battle of the Revolutionary War.

Yorktown was the scene of a second siege during the Civil War (see YORKTOWN, SIEGE OF). Pop. (1890) 151; (1900) 221.

Yorktown, Siege of, in the Civil War, On 4 April 1862 Gen. McClellan, with 58,000 men and about 100 guns, started from Fort Monroe up the York Peninsula for his campaign against Richmond. His plan of operation was to move in two columns, one on the right direct to Yorktown, and another along the James River westward of and beyond Yorktown to the vicinity of Williamsburg. Should the Confederate works at Yorktown and Williamsburg offer serious resistance he designed to land Gen. McDowell's First corps, reinforced if necessary, on the left bank of the York or on the Severn, and move it on Gloucester and West Point, in order to take in reverse whatever force the enemy might have on the peninsula and compel him to abandon his positions. At the end of the first day's march Gen. Heintzelman's Third corps on the right bivouacked at Howard's Bridge and Cocketown beyond, and Gen. Keyes' Fourth corps on the left, at Young's Mill, near James River. On the 5th Keyes resumed his march for the Halfway House, between Yorktown and Williamsburg, but had hardly got on the road when it was ascertained that a large force of the enemy, with a battery, was at Lee's Mills, six miles beyond, barring the way over the Warwick, which, according to the maps, should not have run in that direction. Keyes advanced, and in the afternoon found the situation as reported; and after some artillery-firing he encamped for the night. On the right Heintzelman advanced to near Yorktown, came under artillery-fire from the works, and encamped fronting them, where he was destined to remain a full month. Yorktown, as well as the line of the Warwick southward to James River, was held by Gen. J. B. Magruder, with about 11,000 men. For ten days McClellan remained in front of Magruder, making some reconnoissances, but no serious demonstrations. He was engaged in bringing up troops and guns preparatory to a regular siege, and was asking for heavy reinforcements and more heavy siege-guns. He was compelled to adopt the slow method of a siege from his exaggerated idea of the Confederate strength in his front and by

YORKTOWN—YOSEMITE VALLEY

the fact that McDowell's corps of 33,400 men, which he had proposed using to flank Yorktown, by Gloucester and West Point, had been withheld from him, to protect Washington (see *PENINSULA CAMPAIGN of 1862*). On the 16th an attempt was made upon Magruder's lines at Lee's Mill (q.v.), but resulted in failure, and McClellan, giving up the idea of carrying the Confederate position by assault, devoted his attention entirely to siege operations against Yorktown. Under the direction of Gen. Fitz-John Porter, who was made director of the siege, Gen. J. G. Barnard, chief of engineers, and Gen. W. F. Barry, chief of artillery, the operations were conducted elaborately and with great skill. Gen. Barry reports that the siege train consisted of 101 pieces, as follows: "Two 200-pounder Parrott rifled guns, eleven 100-pounder Parrott rifled guns, thirteen 30-pounder Parrott rifled guns, twenty-two 20-pounder Parrott rifled guns, ten 4½-inch rifled siege guns, ten 13-inch sea-coast mortars, ten 10-inch sea-coast mortars, fifteen 10-inch siege mortars, five 8-inch siege mortars, and three 8-inch siege howitzers. Three field batteries of 12-pounders were likewise made use of as guns of position." These guns were mounted on very elaborate works, some 15 in number, established opposite the town and the works to its right, at ranges varying from 1,500 to 2,200 yards. In number and weight of metal they were far superior to those of the Confederates. On the 17th Gen. J. E. Johnston had been assigned to the defense of the peninsula and Richmond, and he had on the Yorktown and Warwick line not to exceed 50,000 men. He made no strenuous effort to interfere with McClellan's operations, but determined to hold his position until McClellan was ready to attack and then to fall back without waiting to have his troops driven from their works. By 30 April McClellan had present for duty 115,102 men, including Franklin's division that had been sent to him to turn Yorktown by Gloucester Point or West Point, but which since its arrival on the 20th had been kept on board transports. On 1 May McClellan proposed to open fire on the morning of the 6th with all his guns, and to press the siege until final assault should be deemed practicable. But on 27 April Johnston had learned that McClellan's batteries were approaching completion and would be ready to open fire in five or six days, and he made his dispositions for retreat. On the night of 3 May, leaving some serviceable heavy guns behind, he evacuated Yorktown and fell back to Williamsburg on the way to Richmond.

E. A. CARMAN.

Yorktown, Siege of. In the war of the American Revolution, Lord Cornwallis and the British army reached Virginia in May 1781, and in the following August invested Yorktown, on the York River. Washington and his army advanced on the enemy by land, and the French fleet of Count de Grasse, numbering 28 ships of the line, with nearly 4,000 infantry on board, reached the Chesapeake and came to safe anchor in the mouth of York River. Cornwallis was

securely blockaded both by sea and land. Just after the arrival of Count de Grasse came also Count de Barras, who commanded the French flotilla at Newport. He brought with him into the Chesapeake 8 additional ships of the line and 10 transports; also cannon for the siege of Yorktown. By the beginning of September York River was effectually closed at the mouth and the Americans and the French began to strengthen their lines by land. On 5 September the English Admiral Graves appeared in the bay with his squadron, and a naval battle ensued, in which the British ships were so roughly handled that they were glad to draw off and return to New York. On 28 September the allied armies, now greatly superior in numbers to the enemy, and confident of success, encamped closely around Yorktown, and the siege was regularly begun. By 6 October the trenches had been contracted to a distance of only 600 yards from the British works. From this position the cannonade became constant and effective. On the 13th, in the night, the Americans made an assault, and the outer works of the British were carried by storm. At day-dawn on the 16th the British made a sortie from their intrenchments, but were wholly unsuccessful. On the 17th Cornwallis proposed to surrender, and on the 19th Major-General O'Hara led out the whole British army from the trenches into the open field, where, in the presence of the allied ranks of France and America, 7,247 English and Hessian soldiers laid down their arms, delivered their standards, and became prisoners of war.

Yorkville, S. C., town, county-seat of York County; on the South Carolina & Georgia extension and the Southern R.R.'s; about 85 miles north of Columbia. It is in an agricultural region, in which are valuable deposits of iron. It has iron works, machine shops, saddle and harness factory, spoke and handle works, and lumber mill. There are seven churches and two graded schools (including high school departments), one for colored and one for white pupils. The savings bank has a capital of \$50,000. Pop. (1890) 1,553; (1900) 2,012.

Yoruba, yô-roo-bâ, or Yarriba, yâ-rê-bâ, northern Nigeria, West Africa, a former independent state situated north and north-east of the colony of Lagos, peopled by a number of confederated tribes, and now attached to the colony and protectorate of Lagos. Much of the country is fertile and well cultivated, and the inhabitants have made great progress in the industrial arts. They are largely pagans, but Mohammedanism and Christianity have made way among them. Protestant and Roman Catholic missions have long been at work. Ibadan, to which there is a railway from Lagos, is the largest town, having about 200,000 inhabitants; Oyo, farther to the north, is the capital.

Yosemite, yô-sêm'î-tê (Indian, "full-grown grizzly bear") **Valley,** in Mariposa County, Cal., on the west slope of the Sierra Nevada; about 150 miles, in direct line, east by south of San Francisco. This valley is one of the natural curiosities of America, and is unlike any other known valley in the world. It is about six miles long and from half a mile to a mile wide. It is nearly a mile below the general level of the land near it. Entering the valley from the lower end, the two distinct valley

types may be seen, the V-shaped, and the U-shaped (see VALLEYS). It has the characteristics of a gorge and also of a cañon. It is nearly enclosed by walls of granite from 3,000 to nearly 5,000 feet in height. On the north side is a huge block of granite called El Capitan. It projects into the valley so that two of its smooth, almost perpendicular faces are visible; the height is 3,300 feet. Opposite El Capitan are Cathedral Rocks and Bridal Veil Rock. From the summit of El Capitan to the summit of Bridal Veil Rock is one mile; but at the base of the rocks the distance apart is not great. The bottom of the valley widens from El Capitan up to the "meadows." Other conspicuous blocks of the unbroken wall are called the Three Brothers (4,000 feet), the Spires, Cap of Liberty, and Sentinel Rock.

About 15 miles above is the source of the Merced River, which flows through the Yosemite Valley. The Illonette River which enters the valley from the south, and the Tenaya Fork, from the northeast, are branches of the Merced. There are two falls and about half a mile of rapids in the Merced River, beginning just below the point where the stream enters the valley. Nevada Fall, the upper one, is about 600 feet high, and Vernal Fall is about 400 feet. The Bridal Veil Falls is on the side of Cathedral Rock which faces the entrance. Bridal Veil Creek here falls over a precipice 630 feet high, and flows over an irregular bed which forms a series of cascades that combined make a descent of about 300 feet. The total fall is 900 feet. The name comes from the appearance of the highest vertical sheet of water at times when the amount of water in the stream is not too great and when the wind sways the "veil of waters." Just below El Capitan is a fall called Virgin's Tears, which is over 1,000 feet high. The waters flow over this precipice only for a few months after the summer heat has melted the mountain snows. The Yosemite Falls, nearly opposite Sentinel Rock, is made by the Yosemite Creek. The first vertical fall is 1,500 feet; then the water descends, in a series of cascades about 625 feet, and again flows over a precipice 400 feet high. In the "meadows" are a variety of flowers and grasses in the early summer months. The principal trees are the pine, fir, cedar, and oak.

In the vicinity are many features of interest; great masses of dome-shaped rocks, and the famous "big trees" of California are nearby. Among the prominent elevations are North Dome, Sentinel Dome, Half Dome, and Glacier Point. From Sentinel Dome may be obtained a good view of the Yosemite Valley and the surrounding country. Glacier Point (4,740 feet) also affords a magnificent view. Half Dome is an imposing mass, 4,700 feet high.

The Yosemite Valley was discovered in 1851 by settlers who were located near a mining camp in the vicinity. The Indians had been annoying the white settlers and miners, and while in pursuit of the band of red men, the whites found this valley. It was named after an Indian chief. In 1864, Congress gave the Yosemite Valley to the State of California, to be "held for public use, resort, and recreation," and to be "inalienable for all time." It is under the control of commissioners who are appointed by the governor. Private parties have built wagon-roads to the valley, and trails to various

points of interest in the vicinity. In 1886 a railroad, 22 miles long, was built from Berenda, the Central Pacific Railroad, to Raymond, whence a stage line extends to the valley. In the grant to the State, in 1864, besides the valley proper there was included adjacent territory for two miles around it. Since 1890 the whole grant has been called Yosemite National Park.

Consult: Bunnell, 'Discovery of the Yosemite'; 'Guide to the Yosemite' (California Geological Survey).

You'att, William, English veterinary surgeon: b. Exeter, Devonshire, 1777; d. London 9 Jan. 1847. Having been educated for the ministry, he preached for a few years in London, but about 1813 established there a veterinary infirmary, lecturing on veterinary practice 1828-35. He published 'The Complete Grazier' (American ed. 1864); 'Extent and Obligation of Humanity to Brutes'; 'Treatise on Cattle' (1834); 'Treatise on Sheep' (1837); 'Treatise on the Horse' (1831); 'Treatise on the Pig' (1847); and 'Treatise on the Dog' (1842); and was the owner and editor of 'The Veterinarian,' established in London in 1828, the first periodical devoted to that class of subjects. His writings are still much valued both in England and the United States.

Youghal, yá'hal or yál, Ireland, a seaport of County Cork, on the estuary of the Blackwater, 27 miles east of Cork. The parish church is formed of the nave and aisles of the ancient collegiate church, built by the Earl of Desmond in 1464; the "water gate," the "clock gate," and Sir Walter Raleigh's house, Myrtle Grove, are other notable features. There is a handsome Roman Catholic church, and remains of several ancient conventual and other buildings. Parts of the old city walls are standing. The export of agricultural produce and the fisheries are the chief industries. According to local tradition, the potato was first planted at Youghal by Raleigh, who was mayor in 1588. Pop. (1901) 6,000.

Youmans, yoo'manz, Edward Livingston, American scientist: b. Coeymans, N. Y., 3 June 1821; d. New York 18 Jan. 1887. Partially blind at times through many years of his life, he pursued his studies by the aid of his sister, Eliza Ann Youmans, and became widely known as a popularizer of science. He lectured extensively and in 1872 founded 'The Popular Science Monthly,' which he edited till his death and established the 'International Scientific Series.' The volumes of this series were published simultaneously in different languages in London, Paris, New York, Leipzig, Saint Petersburg, and Milan. He published 'Alcohol and the Constitution of Man' (1854); 'Hand-Book of Household Science' (1857); 'Correlation and Conservation of Forces' (1864); 'The Culture Demanded by Modern Life' (1867); etc.

Youmans, William Jay, American chemist, brother of E. L. Youmans (q.v.): b. Milton, Saratoga County, N. Y., 14 Oct. 1838; d. Mount Vernon, N. Y., 10 April 1901. He studied chemistry at Columbia College and at the Sheffield Scientific School, New Haven, and was graduated from the medical department of the New York University in 1865 and practised his profession for a time at Winona, Minn. In 1871 he was called to assist his brother, who had

YOUNG

planned to publish 'The Popular Science Monthly,' and from that time till 1900 was actively connected with the management and editorship of that periodical. He edited 'Pioneers of Science in America' (1895); Huxley's 'Lessons in Elementary Physiology,' adding a second part, 'Elementary Hygiene' (1867).

Young, Alexander, American Unitarian clergyman: b. Boston 1800; d. there 15 March 1854. He was graduated at Harvard in 1820, studied theology at Cambridge, and in 1825 became pastor of the New South Congregational Church in Boston, which office he held till the close of his life. He published 'Chronicles of the Pilgrim Fathers of the Colony of Plymouth' (1841); 'Chronicles of the First Planters of the Colony of Massachusetts Bay' (1846); 'Library of Old English Prose Writers' (9 vols., 1831-4); etc.

Young, Andrew White, American political economist: b. Carlisle, N. Y., 2 March 1802; d. Warsaw, N. Y., 17 Feb. 1877. His publications include: 'Introduction to the Science of Government' (1835); 'First Lessons in Civil Government' (1843); 'Citizen's Manual of Government and Law' (1851); 'The American Statesman: A Political History of the United States' (1855); 'National Economy: A History of the American Protective System' (1860).

Young, Arthur, English agricultural writer: b. London 11 Sept. 1741; d. there 20 April 1820. He was intended for a mercantile career, but early adopted the profession of agriculture, carrying on farms at various places, and especially on his paternal estate, near Bury St. Edmunds. He soon became famous as a writer on farming and allied topics, and especially for his agricultural tours. He also carried on an extensive correspondence with public men both at home and abroad, Washington being one of his correspondents. In 1784 he began the publication of his 'Annals of Agriculture,' of which 46 volumes were issued. This work had the most important influence upon the art of agriculture in England, and a considerable portion of it was translated into French under the auspices of the government. In 1793 he was appointed secretary of the newly erected board of agriculture, with a salary of £400 a year. Young not only visited and examined with great attention many parts of England and Ireland, but also made several tours on the Continent. He became blind some years before his death. Among his numerous works are: 'The Farmer's Letters to the People of England' (1767, enlarged edition 1777); 'Six Weeks' Tour through the Southern Counties' (1768); 'Six Months' Tour through the North of England' (1770); 'Farmer's Guide' (1770); 'Farmer's Tour through the East of England' (1771); 'The Farmer's Calendar' (1771); 'Tour in Ireland' (1780); 'Travels in France during the Years 1787-89' (1792-4); treating of agriculture and national resources, the social and political condition of the people, the most reliable source of information regarding the state of France on the eve of the Revolution; 'Essays on Manures' (1804); 'The Rise of Prices in Europe' (1815). By order of the French Directory his agricultural works were published in French in 20 volumes entitled 'Le Cultivateur Anglais' (1800-1). Consult: Les-

lie Stephen, 'Studies of a Biographer' (1898); his Autobiography edited by Miss Betham Edwards (1898); and bibliography by Anderson in Hutton's edition of 'Tour in Ireland' (1892).

Young, Brigham, American Mormon leader: b. Whitingham, Vt., 1 June 1801; d. Salt Lake City 29 Aug. 1877. He learned the trade of painter and glazier and worked at this occupation in Mendon, N. Y. Early in life he joined the Baptists, but in 1831 was converted to Mormonism, and joined the sect at Kirtland, Ohio, in 1832. In 1835 he was ordained an elder and sent forth as one of the 12 apostles, the New England States being the district assigned him. On the death of Joseph Smith, in 1844, he was unanimously chosen president and prophet, though he had three competitors for the office, one of whom, Sidney Rigdon, he soon afterward excommunicated. On the forcible expulsion of the sect from Nauvoo, Ill., in 1846, Young led them through toils and dangers, which nothing but the most untiring energy could have conquered, over the plains and tablelands to the valley in the heart of the Rocky Mountains, where, between the Wasatches and the Great Salt Lake, he founded in July 1847 the present Salt Lake City. His immediate followers forming a nucleus, others poured into "the Promised Land," and in 1849 an attempt was made to organize a State, to be called the State of Deseret, that being the official name given by the Mormons to the district. The United States government refused to sanction the new State, but Utah was organized as a territory, and Young appointed governor by President Fillmore. The appointment of a "Gentile" governor in 1854 led to serious troubles as Young and the other Mormons refused to recognize his authority, and it was not till a force of 2,500 troops was sent out in 1857 that the United States government could enforce its authority.

Young was the founder of polygamy as an institution, and among the first to practise it. In 1852 he promulgated the "celestial law of marriage," which he declared to have been revealed to Joseph Smith nine years before. A large party, among whom were Smith's wife and sons, in the Church opposed the innovation, and declared the revelation to be a forgery, but Young's influence carried the day. He himself had from 15 to 18 actual wives, besides numerous spiritual wives who were formally "sealed" to him. He was twice indicted for polygamy, but each time the case fell through. His 19th wife, Ann Eliza Young, sued for a divorce in 1875. The Mountain Meadow Massacre of 1858 was brought to the notice of the law in 1875. In it a company of 136 emigrants, which had come into collision with the Mormon settlers, was practically exterminated, only a few children being allowed to escape. The court exonerated Young from complicity in the affair, but Bishop Lee, a leading Mormon, was condemned to death in 1876, and shot in March 1877 on the scene of the massacre. See MORMONS.

Young, Charles Augustus, American astronomer: b. Hanover, N. H., 15 Dec. 1834. He was graduated at Dartmouth in 1853, was professor of mathematics, physics, and astronomy in Western Reserve College (1857-66); and of astronomy and physics in Dartmouth (1866-77).

YOUNG

Since 1877 he has been professor of astronomy at Princeton. He accompanied the eclipse parties to Iowa in 1866, and to Spain in 1870; the transit of Venus party to Peking, China, 1874, and organized the Princeton eclipse expedition to Denver in 1878. He was the discoverer of the green line of the solar corona in 1869, identifying it with the line 1,474 of Kirchhoff's scale. At the 1870 eclipse he detected the so-called "reversing layer" surrounding the solar photosphere, and in 1872 at Sherman, Wyo., noticed the bright reversal of many lines of the solar spectrum in ordinary sunlight. He is recognized as a leading authority in spectroscopy and has lectured in the courses of the Peabody Institute at Baltimore, the Lowell Institute at Boston, and at many colleges. He is the author of 'The Sun' (1882); 'General Astronomy' (1889); 'Elements of Astronomy' (1890); 'Lessons in Astronomy' (1891); 'Manual of Astronomy' (1902); 'Uranography.'

Young, Charles Mayne, English tragedian: b. London 10 Jan. 1777; d. Southwick, Sussex, 28 June 1856. In 1798 he made his debut at Liverpool as Young Norval, and his first appearance in London, in 1807, was as Hamlet. As Hamlet, Iago and Falstaff he was seen at his best, but his repertoire was very extensive. In 1829 he declined an offer of \$50,000 for a ten months' tour in the United States, and in 1832 retired with a fortune of \$300,000. At his farewell benefit at Covent Garden, 31 May 1852, he appeared as Hamlet, with Mathews as Polonius, and Macready as the Ghost. Consult J. C. Young, 'Memoirs of Charles Mayne Young' (1871).

Young, Clark Montgomery, American educator: b. Hiram, Ohio. He was graduated at Hiram College, and since 1833 has been employed in educational work in South Dakota. He was secretary of the Territorial board of education of Dakota in 1889, and of the State board of education of South Dakota, and since 1892 has been professor of history and sociology in the University of South Dakota. He has published 'The State and Nation' (with G. M. Smith); 'History and Government of South Dakota'; 'Elements of Pedagogy'; etc.

Young, Edward, English poet: b. Upham, Hampshire, 3 July 1683; d. Welwyn, Hertfordshire, 5 April 1765. He was educated at Oxford and in 1708 was nominated to a law fellowship in All Souls College. Befriended by the Duke of Wharton, an annuity of £100 was granted him by the duke. In 1719 and 1821, respectively, appeared his tragedies of 'Busiris' and 'Revenge,' both produced at Drury Lane. In 1725 he began the publication of a series of satires, 'The Universal Passion.' He now took holy orders, and in 1728 was nominated one of the royal chaplains. In 1730 the College of All Souls presented him with the rectory of Welwyn, in Hertfordshire, to which the lordship of the manor was attached. In 1731 he married Lady Elizabeth Lee, daughter of the Earl of Lichfield, and after his marriage the poet lived much in retirement at Welwyn, sadly disappointed that church preferment, which he so eagerly desired and so unscrupulously belauded those in power to obtain, was refused him. The work by which he is best known is 'The Complaint, or Night Thoughts on Life, Death, and Immortality' (1742-5), a series of argumenta-

tive poems in blank verse, intended to prove the immortality of the soul and the truth of the Christian religion—a work displaying great force of pious and somewhat gloomy reflection, and containing many lofty passages, but marred by a straining after antithesis and ornament. The 'Night Thoughts' were translated into French and German, and were as popular on the Continent as at home. Of Young's three tragedies, 'Busiris' (1719); 'The Revenge' (1721); and 'The Brothers' (1753), only the second has kept a place on the stage. His 'Night Thoughts' has never since ceased to be popular, and many of its sententious lines have become proverbial. The poem is not destitute of real excellence, but a note of insincerity runs through it and the poet too often substitutes pomposity for dignity. Consult Mitford edition of Young's 'Poetical Works' with 'Life' (1854); Thomas, 'Le poète Edward Young' (1901); 'Worldliness and Other-Worldliness,' by George Eliot, in 'Westminster Review' for 1857, reprinted in her 'Essays and Leaves from a Notebook' (1884).

Young, Franklin Knowles, American author and inventor: b. Boston, Mass., 21 Oct. 1857. He is the inventor of an automatic breech action for small arms and field artillery and has published 'The Minor Tactics of Chess'; 'The Major Tactics of Chess'; 'Chess Strategics'; 'Napoleon's Campaigns.'

Young, Sir Frederick, English publicist: b. London 21 June 1817. He was formerly a London merchant and has for many years busied himself in endeavors to promote the general welfare, aiding in securing Victoria Park, London, and Epping Forest to the public, and in establishing the People's Palace. He took great interest in emigration and was one of the earliest advocates of imperial federation. He published: 'Long Ago and Now' (1863); 'New Zealand: Past, Present, and Future'; 'A Winter Tour in South Africa' (1890); 'A Scheme for Imperial Federation' (1895); 'Exit Party' (1900); 'A Pioneer of Imperial Federation in Canada' (1902); etc., and edited 'Imperial Federation' (1876).

Young, Frederick George, American educator: b. Burnett, Wis., 3 June 1858. He was graduated at Johns Hopkins University in 1886; was vice-principal of the State Normal School, in Madison, S. Dak., 1887-90; principal of the Portland High School, Ore., 1890-4; president of Albany College, Ore., 1894-5; and was appointed professor of economics and history in the University of Oregon in the year last named. He edited 'Sources of the History of Oregon,' and is editor of the 'Quarterly Journal of the Oregon Historical Society.'

Young, James, Scottish chemist: b. Glasgow 14 July 1811; d. 13 May 1883. He began his career as a cabinetmaker, but in the evenings studied chemistry under Professor Graham in Anderson's College, Glasgow, and became his assistant both there and afterward at University College, London (1832-8). Receiving appointments in chemical works at Manchester and elsewhere, he discovered a method of distilling oil from bituminous shale, and thus became the founder of the mineral-oil industry of Scotland, besides leading to the development of the petroleum industry in America and elsewhere. (See PARAFFIN.) He acquired a large

YOUNG

fortune and endowed a chair of chemistry in Anderson's College, and fitted out at his own expense an expedition in search of Livingstone, in 1872.

Young, James Thomas, American publicist: b. Philadelphia, Pa., 23 Sept. 1873. He was graduated at the University of Pennsylvania in 1893; and became instructor there in 1896. He has published 'Der Staatsdienst in Deutschland, der Schweiz und den Vereinigten Staaten' (1896), and 'Administrative Centralization in France,' and 'Administrative Centralization in England' in the 'Annals' of the American Academy of Political and Social Science.

Young, Jesse Bowman, American Methodist clergyman and author: b. Berwick, Pa., 5 July 1844. He was graduated at Dickinson College in 1868, but had previously served three years in the Union army during the Civil War, becoming captain in the 84th Pennsylvania volunteers. Entering the ministry in 1868, he held pastorates in Pennsylvania and Kansas City, Mo., and was subsequently editor of the 'Central Christian Advocate' (1892-1900); etc. He has published 'What a Boy Saw in the Army'; 'Days and Nights on the Sea'; 'Helps for the Quiet Home' (1900); 'Our Lord and Master' (1903).

Young, Sir John, BARON LISGAR, English statesman: b. Bombay, India, 31 Aug. 1807; d. Ireland 6 Oct. 1876. He was graduated at Oxford in 1829, called to the bar in 1834, and sat in the House of Commons in 1831-45. He was lord of the treasury 1841-4; secretary of the treasury in 1844-6; chief secretary for Ireland in 1852-5; and lord high commissioner of the Ionian Islands 1855-9. He succeeded to the baronetcy on the death of his father in 1848 and from 1860 to 1867 was governor to New South Wales. Appointed governor-general of Canada in 1868 he filled this post till 1872, when he was succeeded by the Earl of Dufferin. During his Canadian governorship he suppressed the Riel rebellion in 1870 and was rewarded with the title of Baron Lisgar.

Young, John Russell, American journalist: b. Downingtown, Pa., 20 Nov. 1841; d. Washington, D. C., 17 Jan. 1899. In 1857 he was copyholder on the Philadelphia *Press*; and later its news editor. At the outbreak of the Civil War he became war correspondent, and was with the Army of the Potomac from the battle of Bull Run to the end of the Chickahominy campaign, when he returned to Philadelphia and became managing editor of the *Press*. In 1865 he joined the editorial staff of the New York *Tribune*, retiring in 1869; established the *Morning Post* in Philadelphia; and the *Standard* in New York (1869); and was European correspondent of the New York *Herald* (1871-7). As correspondent of that paper he accompanied General Grant in his journey round the world in 1877, and was attached to the editorial staff of the *Herald* 1879-82. He was minister to China 1882-5; and was appointed librarian of Congress 30 June 1897. He published 'Around the World with General Grant' (1879); 'Memorial History of Philadelphia,' edited 1895.

Young, Julia Evelyn Ditto, American verse writer and novelist: b. Buffalo, N. Y., 4 Dec. 1857. She has published 'Adrift: A Story of Niagara' (1889); 'Glynn's Wife: A Story

in Verse' (1896); 'Thistle-Down,' poems; 'The Story of Savilla' (1897), verse; etc.

Young, Robert, Scottish Biblical scholar: b. Edinburgh 10 Sept. 1822; d. there 14 Oct. 1889. He became a printer and superintended the Mission Press at Surat, India (1856-61). He subsequently devoted himself to preparing, printing, and publishing at Edinburgh a long series of works of somewhat narrow but remarkable Biblical scholarship; among them were an independent translation of the Bible; 'Marginal Readings (10,000) for the English Testament'; 'Concise Critical Comments on the Holy Bible'; 'Grammatical Analysis' of the Hebrew, Chaldee, and Greek Scriptures (1885); 'Hebrew Vocabulary'; and a laborious 'Analytical Concordance to the Bible,' giving 311,000 references (1880).

Young, Robert Anderson, American Methodist clergyman: b. Knox County, Tenn., 23 Jan. 1824; d. 1902. He was graduated at Washington College, Tenn., in 1844; entered the Methodist ministry, and held pastorates in several cities in Tennessee. He was president of the Wesleyan University, Florence, Ala., 1861-4; financial secretary of the board of trustees of Vanderbilt University, 1874-83; secretary of the board of missions of the Methodist Episcopal Church, South; and secretary of the Tennessee Conference for 21 years. He was editor of the 'Advocate of Missions,' and author of 'Personages'; 'Ariel'; 'Twenty Thousand Miles'; 'Celebrities, and Less'; etc.

Young, Samuel Baldwin Marks, American general: b. Pittsburg, Pa., 9 Jan. 1840. He entered the Union army as a private in 1861; served with distinction through the Civil War; and was brevetted brigadier-general in 1865. Joining the regular army as 2d lieutenant in May 1866, he became colonel in 1897; was commissioned brigadier-general of volunteers the next year, and participated in the Cuban campaign. He was promoted major-general of volunteers; served in the Philippines in 1889-1901; was promoted major-general U. S. A. 2 Feb. 1901; and served as military governor of northwestern Luzon and was commander of the 1st District, Department of Luzon. In February 1902 he was elected as the first president of the newly established Army War College, in Washington, D. C.

Young, Samuel Hall, American Presbyterian clergyman: b. Butler, Pa., 12 Sept. 1847. He was graduated at the University of Wooster, Ohio, in 1875, and at the Western Theological Seminary, Allegheny, Pa., in 1878; and ordained to the Presbyterian ministry in 1878. Going to Fort Wrangel, Alaska, as a missionary and explorer in 1878, he organized the first Protestant church in Alaska in 1879; and afterward held pastorates in California, Illinois, Iowa, and Ohio. Sent to the Klondike in 1897, he established the First Presbyterian Church in Dawson in 1898; and organized missions in Eagle, Romfort, Nome, and Teller. In 1901 he was appointed superintendent of all the Presbyterian missions in Alaska.

Young, Thomas, English physicist and archæologist: b. Milverton, Somerset, 13 June 1773; d. London 10 May 1829. He was of Quaker parentage and was brought up in the strict discipline of that sect, studied medicine and received his degree at Cambridge. As early

YOUNG—YOUNG MEN'S CHRISTIAN ASSOCIATION

Young, Thomas wrote his celebrated memoir on the 'Outlines and Experiments respecting Sound and Light,' which speedily conducted him to the discovery and demonstration of the interference of light. This discovery alone, according to Sir J. Herschel, would have sufficed to have placed its author in the highest rank of scientific immortality. In 1801 he became professor of natural philosophy at the Royal Institution, and in 1802 foreign secretary to the Royal Society—an office which he held for the remainder of his life. The series of lectures delivered in connection with his professorship form the substance of his great work, 'Natural Philosophy and the Mechanical Arts' (1807). In 1811 he was elected physician to St. George's Hospital. In 1818 he was appointed secretary to the board of longitude, with the charge of superintending the 'Nautical Almanac.' In addition to the works already named, and many scientific papers, he published 'An Account of Some Recent Discoveries in Hieroglyphical Literature and Egyptian Antiquities' (1823). Consult Peacock, 'Life of Young,' and 'Miscellaneous Works,' edited by Peacock and Leitch (1855).

Young, William, American poet and dramatist: b. Illinois 1847. He has published 'Wishmakers Town,' poems (1885-98); and the plays: 'Jonquil'; 'The Rogue's March' (1872); 'Pendragon,' verse (1881); 'The Rajah' (1883); 'Ganelon,' verse (1888); 'The Home of Mauprat,' with J. G. Wilson (1882); 'Ben Hur,' dramatization (1899); 'Woman's Wiles' (1898); 'The Sprightly Romance of Mersac' (1900); etc.

Young England, a political party formed in London about 1844 by Mr. Disraeli, after he had begun to oppose the general policy of Sir Robert Peel. Besides its founder it contained some young men of ability and position, prominent among them being Lord John Manners, now Duke of Rutland; George Smythe, afterward Viscount Strangford; and Baillie-Cochrane, afterward Lord Lamington. Its programme was the reconciliation of the aristocracy and the Church on the one hand, and the people on the other. Its principles were attractively expounded in Disraeli's two fictions, 'Coningsby' and 'Sybil.'

Young Germany, a group of literary and political innovators in Germany, headed by Heine (q.v.).

Young Ireland, the name applied to a company of Irish agitators, who were active between 1840 and 1850. They at first adhered to O'Connell, but soon became very radical in their opinions and separated from the conservative Irish politicians in 1844. 'The Nation' was their political organ and in this journal the Irish people were constantly incited to revolt. In 1848 John Mitchell (q.v.), one of the leaders of the party, was arrested and sent to Tasmania, and the attempted insurrection which followed soon collapsed, two of the leaders W. F. Meagher (q.v.), and W. S. O'Brien (q.v.), being sentenced to death, but their sentences were presently commuted to transportation.

Young Italy, a society of Italian republicans formed by Giuseppe Mazzini (q.v.) in 1831, whose aims were the emancipation of the

Italian peninsula from the control of Austria, and the union of the various portions of the country under a republican rule. Its greatest activity was in 1834, when Mazzini led an unsuccessful invasion of Savoy. The influence of the society soon declined, but it was of service in arousing Italian patriotism and it formed the model for similar organizations elsewhere in Europe, such as Young France, Young Germany, etc.

Young Men's Christian Association. A Young Men's Christian Association is an organization composed of young men who are united together for the purpose of ministering to the spiritual, intellectual, social, and physical needs of young men. Any young man of good moral character, regardless of race or creed, may become a member of this organization and enjoy its privileges; but only active members, who must be in communion with a Protestant evangelical church, can vote or hold office. Local associations are usually under the administration of a board of directors, which employs to carry on its work officers known as general secretaries, physical directors, boys' secretaries, etc. Local societies are independent and autonomous in their administration. Local societies are affiliated together into national, and sometimes into international, unions. These national unions are under the administration of a national committee. The national organizations are further united into a world's organization, having its headquarters at Geneva, Switzerland. The world's organization is administered by what is known as the Central International Committee of Young Men's Christian Associations, 3 Rue Général Dufour.

History.—The establishment of the Young Men's Christian Association was occasioned by the growth of the modern city. The city movement which has spread throughout the more industrial parts of the world created an environment which made necessary special effort in behalf of young men. Without the rise of the city, the parlors, gymnasiums, reading-rooms, educational classes, Bible studies, religious meetings, this vast organization of over 700,000 young men, with its secretaries, directors, committees, costly buildings, and mighty influence would never have been born.

The Association movement was founded by a young man who came from the country to the city. It was founded primarily for commercial young men living away from home in cities. Without the spread of the city it would have remained a London institution, and never have become a world-wide organization. The city has become the dominant factor in modern life. Young men form the largest and most important element of the large army which is annually invading the city from the country. The proportion of young men in the city is much larger than in rural districts. In the city, the home and the Church have a smaller place in the life of the average young man than in the country. The city is full of opportunities to gratify temptation. Contrasted with the country, where life is in the open air and activity is chiefly muscular, life in the city is indoors, and far more full of nervous excitement. It should also be said that the city has brought young men together in large numbers, and so made possible

YOUNG MEN'S CHRISTIAN ASSOCIATION

an organization among themselves in their own behalf.

The history of the Association falls into three periods: 1844 to 1855, the founding of the Association; 1855 to 1878, the development of Association methods; 1878 to the present time, the wide extension of the movement.

Period I., 1844 to 1855. Founding of the Young Men's Christian Association.—The founder of the Young Men's Christian Association, George Williams, now Sir George Williams, who was born at Ashbury Farmhouse, near Dulverton, southern England, in 1821, grew into manhood at the time when the industrial revolution in England was attracting young men from the country to the town. He went to London in October 1841, and became a clerk in the dry goods establishment facing St. Paul's churchyard, of which he is now the proprietor. At that time there were some 80 young men employed in the different departments of the business. Through Mr. Williams' efforts, a Young Men's Christian Association was organized, for the purpose of establishing religious services and Bible classes among the young men employed in various houses of business in London. This organization took effect on 6 June 1844. The name was suggested by Christopher Smith, George Williams' room-mate. The constitution provided that the Association should seek to promote the spiritual and mental improvement of young men engaged in the drapery trade, that its membership should be young men who gave decided evidence of conversion to God, and that its management should be in the hands of a small board chosen from the membership. This movement rapidly assumed important proportions. Prayer meetings and Bible classes were soon established in 14 different business houses, and a missionary to young men was employed in January 1845. In 1848, apartments were rented, in which a library, reading-room, restaurant, social parlors, and educational classes were provided; and young men who made no religious profession were invited, upon the payment of a small fee, to use the privileges of the institution, though they were given no share in its management and were known not as members but associates. A lecture course was established, which soon became the most important lecture platform in London. Branches of the parent society sprang up in different parts of the metropolis, and provincial branches in different parts of the United Kingdom became affiliated with the parent society.

The Association was marked by intense religious zeal. Through personal interviews by its members with young men, through Bible classes and evangelistic meetings for men, a persistent campaign was carried on to win young men to lead a religious life. The secular agencies developed considerably during the first seven years. In 1851, in the Central Association, there were 225 members and 425 associates. There were estimated to be 750 members and associates in the other branches in the metropolis. At this time there were 8 societies in London, and 16 in various parts of the United Kingdom. The 24 Associations enrolled approximately 2,700 young men.

Knowledge of this work came to America in the fall of 1851 at three different centres—Montreal, Boston, and New York. The first movement took place at Montreal, where,

through the efforts of two young men who had become acquainted with the London work through published copies of the lectures delivered before the London Association, an Association was formed on 25 Nov. 1851. In November 1851 George Petrie, who had become well acquainted with the London work during a visit to that city, called together a group of his personal friends in New York. These conferences, however, did not result in organization until encouraged by the success at Boston, where the first Association in the United States was established.

A letter published on 30 Oct. 1851, describing in detail the work of the London Association, came under the eye of Captain Thomas V. Sullivan, who was active in Christian work among seamen, and so impressed him that he determined to establish a society in Boston. His purpose was accomplished at a meeting held on 29 Dec. 1851, in the chapel of the old South Meeting House in Spring Lane. The Boston society laid great emphasis upon the Association as a social resort. It introduced the committee system, and inaugurated the plan of restricting voting and officeholding to members who were in good standing in an evangelical church. It was the Boston society which gave character and direction to the American movement. It immediately became one of the leading religious agencies of the city. Twelve hundred young men joined its membership; 16,000 copies of its constitution and by-laws were printed and scattered broadcast over the United States; representatives of the society assisted in founding Associations at other points, and through its influence, by the year 1854, some 26 Associations had been established in different parts of the Union.

Through the efforts of Chauncey M. Langdon, a government employee in Washington, and later a clergyman in the Episcopal Church, a convention of the American Associations was called at Buffalo in June 1854. This convention established an alliance of the associations of the United States and Canada, under the supervision of an executive committee which was instructed to call annual conventions, and to do everything in their power to foster and extend the work of the associations. The organization was made international at the suggestion of a delegate from the association at Toronto, Ont., who had been invited to the convention. This alliance was known as the American Confederation, and it was largely through its influence that the American movement rapidly took pre-eminence among the associations of the world.

In the meantime, through the efforts of George Williams and others, associations had been established at Paris and other points in France, and at Geneva, in Switzerland. Prior to the founding of the association, a movement known as the "Junglingsverein" had been started among young workmen in Germany in the year 1834. This had already come into friendly correspondence with the associations in England. The German associations, while not on a strictly inter-denominational basis, were invited into alliance with the Young Men's Christian Association, and have always continued in this fellowship. Since uniting with the general movement, they have greatly increased.

The culminating event of the early period was the first convention of the associations of all

YOUNG MEN'S CHRISTIAN ASSOCIATION

lands, held at Paris in 1855, at which the memorable statement of belief known as "the Paris basis" was adopted. This has been called the apostles' creed of the association, and did much to unify the movement. It was proposed by Mr. Frederick Monnier, a layman from Strasburg, and was read before the convention, all the delegates standing, "in which position it was then solemnly passed by the unanimous vote of the whole assembly. The members present then knelt together, gratefully to acknowledge the mercy of God and to entreat His benediction on the decision at which they had arrived." The basis was as follows:

The Young Men's Christian Associations seek to unite those young men, who, regarding Jesus Christ as their God and Saviour according to the Holy Scriptures, desire to be His disciples in their doctrine and in their life, and to associate their efforts for the extension of His kingdom among men.

The reports of this convention showed the estimated strength of the association movement as follows:

	Associations	Members
Continent of Europe:		
Germany	130	6,000
Switzerland	54	700
France	49	700
Holland	10	400
Belgium and Italy.....	3	60
Total	246	7,860
British Isles	47	8,500
United States and Canada...	36	14,000
Total	329	30,360

The period from 1844 to 1855 saw the association founded in the various Protestant countries, an International Alliance established on the American continent, and a uniform basis adopted by the associations of all lands. The fundamental principles of the association began clearly to emerge. Although the movement was at first primarily religious and spiritual in character, the association was led to add secular agencies for ministering to the intellectual and social needs of young men. It recognized the principle that ministering to the needs of a man is one of the surest ways to promote his religious life; and on the other hand, that the Christian religion demands the development of all human powers and their use in the service of God. It is upon these two truths, the power of environment to mold character, and the adoption of the religion of Jesus Christ to redeem manhood, body, soul, and spirit, that the Young Men's Christian Association rests its claim for a place among the agencies of the church.

Period II. 1855 to 1878. Period of Development of Association Methods.—During the years from the Paris convention in 1855 to the Geneva convention in 1878, when a central executive committee for the associations of the world was established, with headquarters at Geneva, the Young Men's Christian Associations were gradually developing a world consciousness as an organization, and slowly evolving a method of work for ministering to the needs of young men. During this period, the American associations rose to the place of pre-eminence, and the type of association developed here has in later years spread throughout the world. For convenience the American development during

this period may be further subdivided into four divisions: The period of the confederation, 1855 to 1861; the War period, 1861 to 1866; the revival of the association work after the War, 1866 to 1870; the period of adaptation of the work to the needs of young men, 1870 to 1878.

The six years preceding the Civil War were remarkable for two results in the association: the creation of the International Committee, with its work of supervision, and the great revival which stirred the entire country during the years 1857 and 1858. During these years, the central committee of the confederation was located respectively at Washington, Cincinnati, Buffalo, and Philadelphia. This migratory plan was soon found to be a source of weakness, but much good was accomplished. Annual conventions were held, and information regarding the new movement was widely disseminated. Many new associations were founded; and at the outbreak of the war there were 240 associations in America, with an estimated enrolment of 30,000 members.

In 1856, several members of the New York association established a union prayer-meeting, chiefly for men at the Dutch Reformed Church, in Fulton Street. This was carried on for nearly a year, and in the following September it was given over to Mr. J. C. Lamphier, the city missionary of the Dutch Reformed Church, with the understanding that it should be continued on a union basis. The committee of the association arranged to co-operate heartily in this meeting.

In the fall of 1857 came the financial panic which prostrated the business interests of the country. Large numbers of men began immediately to attend this noon prayer-meeting, and, under the auspices of the New York association, many more union meetings were established in different parts of the city. Similar meetings were conducted by all the Young Men's Christian Associations throughout the country. It is estimated that over 300,000 persons were added to the evangelical churches of America as a result of this revival.

The years from 1861 to 1866 in America were overshadowed by the cloud of the Civil War. The financial depression and the distractions attending the outbreak of the War brought the association to the lowest point it ever reached. The Boston membership declined from 2,400 to 700. The New York City association, at the beginning of 1862, had but 151 members; it was burdened with a debt of \$2,400, and its work had sadly declined. It is recorded that only 60 organizations survived the War; and yet, in the midst of this depression and apparent weakness, the association performed one of the most heroic tasks ever undertaken by a religious organization.

Through the influence of the association in New York, heartily seconded by those of Boston, Washington, Philadelphia, Chicago, and other places, the United States Christian Commission was organized. This was the first organized attempt, on a large scale, to minister to both the spiritual and physical needs of soldiers in time of war. The plan of work was to send out delegates with supplies and needed comforts, who should spend some five or six weeks without remuneration, nursing the sick and wounded, distributing literature, conducting evangelistic and religious meetings, bearing messages from home, and in various ways encourag-

YOUNG MEN'S CHRISTIAN ASSOCIATION

ing and helping the soldiers. Over 5,000 of these delegates were sent to the front during the Civil War. The following table shows the vast efforts of this commission in raising money and supplies for the soldiers:

*RECEIPTS BY THE UNITED STATES CHRISTIAN COMMISSION.

	1862	1863	1864	1865 (4 mos.)	Total
Cash	\$ 40,160	\$358,200	\$1,297,755	\$ 828,357	\$2,524,472
Supplies	191,096	558,637	1,584,592	1,432,298	3,766,623
Totals	\$231,256	\$916,837	\$2,882,347	\$2,260,655	\$6,291,095

*Moss, United States Christian Commission, p. 729.

This was an heroic service, and won for the association the admiration and confidence of the public. In the meantime, the New York City society had secured for its secretary, Robert R. McBurney, and for its president William E. Dodge, Jr. It had on its board of directors Hon. Cephas Brainerd, who had been identified with its work from the beginning, and who had early perceived the true mission of the association. Mr. Dodge with his associates set about developing in New York a work specifically adapted to the needs of young men, and introduced a new era in association history. Mr. Dodge was in sympathy with the idea of a clean, home-like social resort for young men, and with the providing of opportunities for physical training. It was at his suggestion that the constitution of the New York City association was altered so as to provide for the erection of a gymnasium. Mr. Dodge was also influential in enlisting large gifts for the association. He was himself the largest donor to the first building.

The years from 1866 to 1870 mark the revival of the American work after the war. In June 1866 an international convention was called at Albany, which outlined a new policy for the associations. The plan of a migratory international committee was given up, and the headquarters were permanently established in New York city. Hon. Cephas Brainerd was, a year later, chosen chairman of this committee, a position which he held for 25 years. This convention announced the platform that the work of the association should be limited to young men, although it was some years before this became the actual practice. The convention established a day of prayer for young men in November, which has become a world-wide observance. It also arranged for the organizing of State committees, and the beginning of what is usually spoken of as state work. The great contribution of this convention, however, was the emphasis which it placed on the true field of the Young Men's Christian Association as distinctive work for young men. In his opening address, Mr. Brainerd said: "Our future progress rests upon an unswerving devotion to the primary objects and aims of this association—the social, mental, and religious improvement of young men. As organizations with these avowed objects, we challenge attention. As seeking these ends we are prominently before the world. Because of these things we are what we are. When we deviate from them, we trench upon ground assigned to others."

As yet there was no uniformity among the associations in America as to the conditions of membership. At the international convention held in Portland, in 1869, it was decided that only members of evangelical churches should

vote or hold office in the association, and stated that:

We hold those churches to be evangelical which, maintaining the Holy Scriptures to be the only infallible rule of faith and practice, do believe in the Lord Jesus

Christ (the only begotten son of the Father, King of Kings, and Lord of Lords, in whom dwelleth the fullness of the Godhead bodily, and who was made sin for us though knowing no sin, bearing our sins in His own body on the tree) as the only name under heaven given among men whereby we must be saved from everlasting punishment.

In the meantime, in New York city a determined effort was being made to erect a suitable building adapted to the needs of young men. In addition to the work already undertaken for the spiritual, intellectual, and social improvement of young men, it was decided to add a gymnasium for physical training. After an earnest canvass for funds, and a most careful study of plans, the historic building on the corner of Twenty-third Street and Fourth Avenue, which provided under one roof for the various phases of association activity, was erected. This building cost \$487,000, and was opened to the public in November 1869. Here was developed the modern type of the diversified work for the cultivation of Christian manhood, which has become characteristic of the American associations, and which is spreading throughout the world.

A unique feature of this building, which has been copied in most association structures, was the central reception-room, or lobby, in which was the public office of the secretary, and through which every one must pass upon entering the building. From this reception-room opened the reading-room, the parlors, the amusement-room, the gymnasium, the library, the educational class-rooms, and the secretary's private office. This enabled the secretary in charge to control the various activities which were housed under one roof, and to keep in touch with the multitude of young men who took advantage of the privileges of the association.

The years from 1870 to 1878 in America may be characterized as a period of adaptation of the work of the association to the needs of young men, and the extension of this work to various classes of young men. It is an interesting fact that, as soon as the organization specialized its work and limited it to young men, it immediately found a large field for service. In 1872, at Cleveland, a branch association was founded for work among railroad men. This met with a hearty response from the men themselves. A secretary was employed, rooms were opened at the railway station of the Lake Shore & Michigan Southern road, and an effort made to extend the work elsewhere. Similar societies were also organized at a number of the terminal points, and in the fall of 1875 the attention of Mr. Cornelius Vanderbilt was called to this work. Through his endorsement, other railroad officials became interested in this movement. It was soon found that it was worth while

YOUNG MEN'S CHRISTIAN ASSOCIATION

for railroad corporations to provide the facilities and attractions of a Young Men's Christian Association for the comfort of their employees.

As early as 1858, at the State Universities of Michigan and Virginia, student Young Men's Christian Associations had been organized. Early in the 70's, Mr. Robert Weidensall organized similar societies in a number of colleges. By 1876 there were 25 college associations, with about 2,500 members. Through the influence of Mr. Luther D. Wishard, a student at Princeton, representatives of all college associations were invited to the international convention held at Louisville, Ky., in 1877. This resulted in the inauguration of the inter-collegiate movement as a department of the work of the international committee. An extended effort was also made during this period among German-speaking young men, and toward its close a work was inaugurated among colored young men.

One of the most important agencies developed during this time was the work of supervision. The international committee located in New York steadily grew in resources and influence. A number of the most prominent Christian business men of New York city and other parts of the country accepted positions of responsibility upon this committee. In 1868, Mr. Robert Weidensall became the first traveling secretary, being located in the West with headquarters at Omaha, afterward Chicago. He is still in the service of the committee. Mr. Weidensall has done much pioneer work, organizing state committees, and introducing many new phases of work for young men. In recent years he has particularly fostered what is known as county work for young men in rural districts. Mr. Richard C. Morse accepted a position with the international committee in December 1869, first as editor of the 'Association Monthly,' and in 1872 as executive secretary of the committee, in which position he has continued until the present time.

At the close of this period, 1878, the American international committee had in their employ eight traveling secretaries, and in addition to the general work, were supervising work for railroad men, college students, German-speaking young men and colored young men. The budget for 1878 showed an expenditure for supervision on the part of the international committee of \$16,875. The American associations at this time reported 141 employed officers. Of these, 100 were general secretaries, 21 assistants, 12 State, and 8 international secretaries.

In other lands, while war, ecclesiastical conditions and general conservatism retarded the growth of the associations, a marked development had taken place. Every three years, conventions of the associations of all lands were held in different European cities. To these, the American associations since 1872 have regularly sent representatives. During the early 70's, Mr. Moody made his evangelistic campaigns in the British Isles, and did a great deal to stimulate the work of the Young Men's Christian Association in securing money for buildings, in arousing spiritual zeal, and in calling the attention of the Church to this important work. In 1878, some 40 representatives of the American associations attended the world's convention, which met at Geneva, Switzerland. Up to that time there had been no established headquarters for the world's work. General affairs had been ad-

ministered from London through Mr. W. E. Shipton, the secretary of the London association. It was chiefly through the influence of the French and American delegates that the Geneva convention voted to organize the work of the associations in all lands under an advisory committee, which should have a quorum located at Geneva, Switzerland. Col. Charles Fermand, an officer in the Swiss army, and a man with bright business prospects in Geneva, consented to give up his calling and accept the position of general secretary of this committee. By the year 1878, with the establishment of the world's committee, the Young Men's Christian Associations of the world may be said to have developed their ideal of work for young men.

Period III. 1878 to 1904. Period of Expansion.—Expansion has been the striking characteristic of the period from 1878 to 1904. The American associations have increased in membership three and one-half times, from 99,000 to 350,455; in value of property, from \$2,295,000 to \$28,827,886; in the number of buildings, eight-fold, from 56 to 460; in employed men, fourteen-fold, from 141 to 1,934; the current expenses for operating the associations have increased ten-fold, from \$376,000 to \$3,583,506. (These figures are taken from reports for 1903.)

The two factors which have most profoundly influenced the Association movement, during this period, have been the securing of property, and of trained secretaries and directors who give their whole time to this service. The carrying on of an all-round work for young men—physical, social, intellectual, and spiritual—demanded not only experienced and able men to conduct the work, but commodious and properly adapted structures in which it could be housed.

The discoverer and demonstrator of the secretaryship was Robert R. McBurney, who was secretary of the New York City association from 1862 until his death in 1898. Under his leadership, this office was developed and the number of employed men increased. Of all the agencies the association movement has brought forth, the most vital is the secretariate. To this may be attributed its permanence and continued power. There are now nearly 2,000 men devoting themselves to this service as a life work. The pre-eminence of the American associations is chiefly due to this policy of employing salaried officers. About five-sixths of the secretaries employed by the associations of all lands are in the United States and Canada.

Not only have men been employed for supervisory work, but since 1870 there has been an increasing demand for Christian young men to devote their lives to service in the association as physical directors. Three hundred and fifty-three of these men are now employed. To the Christian physical director, the Young Men's Christian Association owes the development of the physical department, which aims not only to give young men physical training, but rugged, vigorous bodily development. This department has proved a great attraction to young men. In 1896, the 'Year Book' reports 52,672 men as using the physical department of the association. In 1900, there were 80,433, and for 1902 there are reported 129,193 individuals, of whom 35,210 were boys. Much of the progress in this department has been due to the leadership of Dr. Luther Halsey Gulick, who became instructor of physical training at the Association Train-

YOUNG MEN'S CHRISTIAN ASSOCIATION

ing School at Springfield in 1886, in which position he continued until 1900. In 1888, he was also appointed secretary of the international committee for the physical department, in which office he served until the spring of 1903. The Young Men's Christian Association is doing the most extensive work in physical training of any agency in the country. It is also interesting that more than 40 per cent of the physical directors in academies and colleges have been furnished by the association. The physical department has proved not only a means for physical well-being, which is much needed under modern city conditions, but also a means of leading young men into lives of personal purity.

The following table shows the employed officers in the association exclusive of physical directors:

GROWTH OF THE SECRETARYSHIP

In 1885, at Springfield, Mass., a school was established for the training of general secretaries for the Young Men's Christian Association. The year following, a physical department was added for the training of physical directors. This school at first offered a two-years' course of study, which was later extended to three years. In 1890, a similar school was established at Chicago. This institution also conducts a summer term at Lake Geneva, Wis. In 1902, a summer school was established at Silver Bay, Lake George. These educational agencies seek to thoroughly train officers for the Young Men's Christian Association as a life work. About one sixth of the officers of the association have received training at these institutions. The courses of study cover the Bible, Church history, psychology, sociology, religious pedagogy, physiology, anatomy, anthropometry, physical diagnosis, physiology of exercise, gymnastics, athletics, aquatics, history of the Young Men's Christian Association, methods of work among young men, etc. There are about 150 students enrolled in these two institutions in addition to those attending the summer institutes.

The building movement in America has developed with increasing momentum. In 1890, there were 205 buildings, valued at \$8,350,000, in the United States and Canada; in 1900, there were 359; in 1902, there were 460. During the past year, 40 association buildings have been erected. There is no greater testimony to the confidence of Christian philanthropists and business men in the Young Men's Christian Association and its work than the investment of large sums of money in association property. The type of architecture developed by the Young Men's Christian Association is of the club order, its buildings being home-like and social.

One of the striking developments of this period in the city work has been the growth of the educational classes. Immediately upon the erection of the building on the corner of Twenty-third Street and Fourth Avenue in New York city, evening classes were started in different subjects for young men. Similar classes were carried on in other cities, and by 1892, 20,526 different men were under instruction. In 1892, a secretary for the educational department was appointed by the international committee, and this work has been systematized and greatly developed. International examinations are now held annually, in which large numbers of students take part. International certificates are accepted by more than 100 different colleges and institutions. An illustration of the growth of this department is seen in Boston, where the association in 1903 reported 1,184 different students, studying in its evening classes. This association has a law school which has been given by the legislature a charter, granting the right to confer degrees, and the past year graduated 19 students who were admitted to the Massachusetts bar. Nearly every association contains a reading room, 700 report having libraries, and many others are distributing stations for public libraries. In January 1904, 30,600 different students were reported as taking class work; the total expense for class instruction was \$111,000, and the receipts and tuition fees from the students was \$86,099. In that year, 1,426 students won international certificates.

In its religious work the associations have made the most marked progress in recent years. This has now been organized into a system, having four features: (1) Religious meetings for men, chiefly evangelistic; (2) personal work for individuals, which seeks through individual interviews to win young men into the Christian life; (3) Bible study, which seeks to organize young men into Bible classes and Bible departments for their religious education; (4) missions, which is an effort to interest young men in the study and support of the work of the associations in non-Christian lands.

The religious meetings of the association for men are generally held on Sunday afternoon, and within recent years what is known as the "big meeting" has become common. This effort began at Trenton in 1894, where the average attendance for the first year was 427, the second 608, the third 727, and for the fourth over 1,000. This meeting has continued with equal results to the present time. There are now some 30 associations which conduct these large men's meetings, the ones in Washington, D. C.; Baltimore, Md., and Springfield, Mass., averaging over 1,000 each in attendance. The Cleveland association has inaugurated what is known as the Sunday Club, where a continuous program of music, Bible classes, addresses, an evening tea, and after-dinner talks, occupy the afternoons of Sunday during the winter. The most notable leader in evangelistic work in recent years is Mr. Fred B. Smith, secretary of the international committee for religious work. The religious work prospectus of the city and railroad associations reports 18,716 professed conversions for the year 1903, 22 per cent of whom had already united with local churches.

In its Bible study department, the progress has been even more marked, particularly in the last five years. In 1901, in the city associations,

YOUNG MEN'S CHRISTIAN ASSOCIATION

19,160 students were reported; in 1902, 25,092; for 1903, 31,300; this is in addition to the large number of men studying in shop Bible classes. The student associations have a thoroughly systematized plan of Bible study, covering the four college years. Student conferences are held at Northfield each summer, and at five other points at which leaders for the Bible classes for the coming year are trained. Reports for the summer of 1904 show that nearly 30,000 undergraduates will be enrolled in these classes the coming year.

An important phase of the religious work of the association is the interest in foreign missions which it has aroused among young men. The student volunteer movement, which is an outgrowth of the student department, is the chief missionary agency in the colleges of this country. It annually secures a large number of students to volunteer for foreign missionary service. In 1903, 3,246 men were reported as in mission study classes. The last student volunteer convention, which was held at Toronto in 1902, was attended by 2,200 delegates.

The latest period of association history has also been marked by a great extension in the work for different classes of young men. In August 1895, the world's student Christian federation of under-graduates of all lands was established. This now enrolls 65,000 members, in 1,400 institutions, in 30 different countries, and is the largest organization among undergraduates in the world. In the United States and Canada the movement has been extended to professional schools, theological seminaries, State universities, and other institutions of learning. There are now 716 college associations upon this continent, enrolling 44,500 students. Thirty American student associations own buildings valued at \$1,000,000. There are now 98 student secretaries devoting their whole time to this work.

The work for railroad men has become one of the most remarkable features of Christian endeavor. Railroad corporations which control three fourths of the railroad mileage on this continent contributed last year over \$200,000 toward the current expenses of the railroad associations now in existence. There are 122 buildings, valued at \$1,829,500, occupied by these associations, with a membership of 62,300, a gain of 30,000 in three years. There are 301 secretaries engaged in this department.

Since 1879 the international committee has employed a secretary to develop the work among colored young men. There are to-day 40 Indian associations, with 1,600 members, under the direction of a traveling secretary, who is a native American Indian.

Largely as an outgrowth of the work for students in other lands, the American international committee was invited by missionaries in India to inaugurate a work among young men in non-Christian lands. This work has always been carried on in subordination to the Church, and as a supplementary work where missions have already been developed. There are now 37 secretaries of the American international committee in India, Ceylon, Japan, China, and Brazil.

With the outbreak of the war with Spain, secretaries were sent out with tents and suitable equipments, and a successful effort was under-

taken to preach the gospel to the soldiers and sailors. The army in the Philippines was provided for in a similar way, and some of the Canadian regiments sent to South Africa were equipped in like manner. This work has been established as a permanent department of the international committee. There are now 269 army posts at which work is being done. Seventy-five tons of equipment in 1903 were shipped to Alaska, China, Philippine Islands, Cuba, Porto Rico, and to different parts of the United States. Three army buildings have been erected.

Even before the Spanish war began steps had been taken to inaugurate a work among the seamen of the navy, and after the war a building was equipped for seamen at the Brooklyn navy yard. This department has developed rapidly, and at the present time there is an organized movement among the seamen of the navy, which is full of promise. Through the munificence of Miss Helen Millar Gould, who has contributed largely toward the railroad and army work, a splendid building has been erected for the Naval Association, near the navy yard in Brooklyn, at a cost of \$450,000. Work is now being done at two other home ports, and on a large scale. There are 27 secretaries in the army and navy associations of the United States.

For many years the work of the associations was limited to young men between 16 to 17 years of age, and upward. It is an interesting sociological development that, in the prosecuting of its work for young men, the association has been led to give its attention to work among boys. Careful study led to the conviction that effort ought to begin at the age when the boy is becoming a man—at the dawn of adolescence. There are almost as many boys in cities between the ages of 12 and 17 as there are young men. The first boys' department was organized at Salem, in 1869, but it is only in recent years that a determined effort has been made to organize a work among boys. In 1890 there were four secretaries giving their time to this department. In 1895 this number had increased to 17, and in 1903 to 107. There are now 46,000 members of boys' departments, and 13 buildings devoted exclusively to boys' work. Five hundred and seventy-six associations have either branches or departments for work among boys. The most unique feature of this department is what is known as the boys' camp, which was first developed by the Young Men's Christian Association, and is already a large factor in Christian work. In 1903 214 summer camps were conducted by the American associations.

One of the most important developments of recent years has been the extension of the association among men engaged in industrial pursuits. The associations were originally for commercial young men. Afterwards associations were organized for students, and later for railroad men. The city associations in recent years have been attracting large numbers of skilled mechanics to their membership, and to-day in the eastern associations, 35 per cent of the members belong to this class. Industrial associations existed in 1897 in connection with the Johnson Steel Plant at Lorain, Ohio, and an association building at a cost of \$25,000 was erected for the use of the workmen. Similar

YOUNG PEOPLE'S CHRISTIAN UNION — Y. W. C. A.

associations have been erected at Proctor, Vt.; Wilmerding, Pa.; Stampo, Ark.; Douglas, Alaska; Cananea, Mexico, and at several other places. An extensive work is also done among the miners in Pennsylvania and the lumbermen in several northern States. In 1902 the Brooklyn Young Men's Christian Association employed a secretary for the organizing of association work among the street railway employees of that city. They now have a building erected at a cost of \$30,000. This is a club house with reading room, library, educational class rooms, auditorium, gymnasium, game room with pool and billiards, also bowling alleys, baths, etc. Similar departments have been organized in a number of other cities.

The industrial revolution which attracted the young men to the city, and so created the basis for the Young Men's Christian Association, has to a large extent depleted the rural districts of young men. At the same time it still remains true that a majority of young men are found in the country. There are 8,000,000 young men in the country districts of the United States and Canada. For many years an effort was made to discover some method of carrying on association work among these men. What is known as the county work has proved so successful that in 10 different States there are now county organizations, the most extensive work being carried on in Kentucky, where eight county secretaries are employed. The plan of work is a county committee, which employs a traveling secretary who will supervise and stimulate Christian work among the young men in the county, organizing Bible classes, men's meetings, in many cases establishing reading rooms, social parlors, sometimes educational classes, and in a few instances organizing clubs for athletics of various kinds. County conventions are held, deputation Sundays, and a carefully systematized effort is made through the entire county.

Whether the Young Men's Christian Association has reached its final form, no one would be bold enough to affirm. It is remarkable that it should have grouped together such a variety of agencies upon the simple platform of young men advancing the Kingdom of Christ among young men. Through the three periods of its development, the association has evolved into an institution with an enlarged ideal, closely akin to that of the Christian university. It is still animated by the evangelistic, spiritual purpose of the original band of young men who rallied around George Williams 60 years ago. But, while keeping uppermost this ideal, it has endeavored to do, in a popular way, for the multitudes of young men of our cities, what the Christian university, in a more scholarly way, is doing for the young men who are to enter the professions. There is every evidence that the association has only begun its career of usefulness, and that in the future it will become a manifold more important factor than in the past.

(1896); Mott, 'Strategic

Points in the World's Conquest' (1897); 'Book of the British Young Men's Christian Associations' (London 1902-3); 'Year Book of the Young Men's Christian Associations in North America' (1903-4).

L. L. DOGGETT, PH.D.,
President International Young Men's Christian Association Training School, Springfield.

Young People's Christian Union, an organization in the United Brethren Church, founded 5 June 1890. It is a union of all forms of young people's societies within the church, uniting them for the purpose of denominational direction. There are now in this union 1,971 societies, of which 251 are junior societies. The total membership is 80,243.

Young People's Society of Christian Endeavor. See CHRISTIAN ENDEAVOR, YOUNG PEOPLE'S SOCIETY OF.

Young Pretender, The, a title applied to Charles Edward Stuart, son of the Pretender. He was defeated by the Duke of Cumberland at Culloden 16 April 1746.

Young Women's Christian Association. The World's, has headquarters in London, and embraces organized associations in the following countries: Great Britain, Canada, the United States, Denmark, Norway, Sweden, Finland, France, Germany, Hungary, Italy, and India. Many of these countries hold national conventions and issue national organs.

The affiliated body in the United States is known as the American Committee, organized in 1886. Its headquarters are in Chicago. At the present time there are connected with the American Committee 24 State associations, embracing organized work in nearly every State in the Union and employing 28 State secretaries. There are affiliated with the American Committee 93 city associations and 10 branch associations in six cities. Three of the 93 city associations are gospel settlements for women. The total active membership of the city associations is 50,638. For the past year 306 Bible classes, 434 physical training classes, 676 educational classes, 227 domestic science, and 225 domestic art classes are reported; 52 associations conduct lunch rooms for women, 35 conduct boarding homes. There are also employment bureaus, travelers' aid work, summer homes, and religious meetings maintained. In 227 factories association workers carry on meetings and clubs for young women.

There are 501 student associations affiliated with the American Committee, with a total membership of 35,181; 269 of these have rooms or buildings, all hold regular religious meetings and missionary meetings. They enroll 4,756 young women in mission classes, and 10,567 students in regular study of the Bible.

The American Committee conducts four summer conferences, attended the last season by 2,026 persons. A training institute for secretaries is conducted in Chicago, and a monthly periodical, the 'Evangel,' is maintained as the national organ.

The International Board of Women's and Young Women's Christian Associations embraces 54 associations in various cities throughout the United States. Of these 40 report boarding homes, 14 report vacation homes, 37

YOUNGHUSBAND — YOUNGSTOWN

report libraries, 20 report women's restaurants, 27 report educational classes, 26 report domestic science and art, 21 report physical classes, 15 have travelers' aid work, 26 have employment departments, 27 maintain work of city relief, hospital, rescue work, homes for the aged and incurables, orphans' home and maternity work, 15 conduct women's exchanges.

ELIZABETH WILSON,
Secretary of the Training Department, Chicago.

Young husband, George John, English soldier. He entered the British army in 1878, and was promoted successively lieutenant 1880, captain 1889, major 1896, and lieutenant-colonel 1900. He served in the Afghan war in 1878-80, in the Sudan in 1885, on the northwestern Indian frontier in 1886, and in the Burmese expedition of 1886-7. In 1895 he was a member of the Chitral relief force, and in 1898 was detailed to accompany the American forces in the Spanish-American war and the subsequent campaign against the Philippine insurgents. He fought in the second Boer war in South Africa (1899-1902), and was severely wounded. Subsequently he was assigned to the Indian staff corps, and in 1904 was the leader of a British diplomatic mission to Tibet which aroused considerable discussion by its unwarranted assumption of the character of a punitive expedition.

Youngstown, Ohio, county-seat of Mahoning County, sixth city in the State, 7 miles north of the southern boundary of the Western Reserve, half-way between Cleveland and Pittsburgh, 67 miles from each; extends nearly 6 miles along the Mahoning River, northwest and southeast, covering 10 square miles. It began where the valley widens and spread mainly north and west to higher land. Since a connecting viaduct was built in 1899 the south side has grown rapidly. The principal business street is Federal, nearly 3 miles long, running through the small Public Square. The best residential streets are Wick, Lincoln and Madison avenues and Bryson street, which are beautifully shaded.

Municipal Service and Improvements.—The city has 125 miles of streets, of which 23 are paved. The street-cleaning service employs 60 men, costs \$34,000 annually and is fairly efficient. There are 48 miles of sewers, discharging by main sewer into the river below the city. The city owns the Holly water-works, installed 1872. This has cost, including efficient filtration plant just being established (1904) to purify supply from river, \$1,000,000, has 78 miles of mains and supplies about 3,500,000 gallons daily, the expense being \$27,000 annually. The city as a whole is very healthy; average general death rate for last four years being 15.04. The police department has 65 men, 49 patrol boxes, and costs \$66,000. The high pressure immediately obtainable from mains renders many steam fire engines unnecessary, but the fire department has two, one chemical engine, six hose carts, seven stations, employs 44 men, and costs \$58,000. Three street railway companies operate in all 132 miles electric line, 29 in city proper, and 103 connecting with surrounding cities. Another of 60 miles reaching East Liverpool and undeveloped coal territory south is under construction. Gas is still used, but electric lighting is general. Natural gas from Pennsylvania furnishes domes-

tic fuel. There are two telephone companies with 4,800 instruments.

Parks and Cemeteries.—The only public park within the city is Wick Park, which has an extent of 47 acres, a natural grove near the northern limits, named for the donors. Just outside but readily accessible, extending southwest on both sides of the stream for 3 miles, is Mill Creek Park of 457 acres, of striking natural beauty. From a waterfall 25 feet high at the south the creek flows through a gorge like a cañon, with steep sides, often rocky, rising sometimes over 100 feet, widening in places and well covered with fine trees. The park, which cost \$260,000, has 9 miles of attractive drives and a lake of 28 acres. Idora Park is a popular pleasure resort of 20 acres located near the above falls. Oak Hill cemetery, 27 acres, begun in 1846, is well situated and possesses some fine monuments. Belmont Park just opened, has 100 acres, and Calvary, just west of the city, with an extent of 50 acres, is owned by the Catholic Church.

Chief Buildings.—The most notable is the handsome steel-frame Dollar Savings and Trust Company. The government building is wholly inadequate, a monument to mistaken economy; there is no municipal building and the court-house is now too small. Aside from banks and churches, there are the Y. M. C. A., one of the finest in the State, costing \$90,000; City Hospital; Public Library; Rayen School, in Ionic style with inharmonious addition; Lucretia K. Baldwin Memorial Kindergarten; Elks and Odd Fellows.

Commerce and Manufactures.—The P. & O. canal, built in 1839, stimulated mining of large deposits of Brier Hill block-coal which long furnished a principal part of Youngstown's commerce and warranted building the railroad to Cleveland, opened in 1856. There are now the Erie, Pennsylvania, B. & O., Lake Shore, and Pittsburgh & L. E. systems, with 67 passenger trains daily and 155 miles of track within the city, crowded with the immense tonnage of "Mahoning Valley" iron and steel industries, of which Youngstown is the centre.

The second blast furnace in the United States to use raw block-coal and a rolling mill for making bar iron were both built here in 1846. Other iron works, which have formed the main industry of the place, followed, using richer lake ore and Pennsylvania coke and coal since native ore and coal were exhausted. The Ohio plant, making steel and rails, started in 1895. There are now in the city eight blast-furnaces, two steel plants, and five rolling mills, with an annual capacity of 1,140,000 tons pig metal, 1,100,000 tons billets and rails, and 600,000 tons finished material, whose actual tonnage in and out for 1903 exceeded 5,500,000, to which similar concerns, just outside but belonging to the city, and kindred industries making boilers, bridges, cars, cranes, engines, forgings, machinery, metal lath and furniture, pipes, tubes, shafting, steel-castings, stoves and washed-metal added 1,000,000 tons. The investment in these industries in and adjoining the city exceeds \$26,000,000. There are also large oil-cloth and rubber plants and works for making automobiles, brass castings, cement, flour, leather, and powder. The last census gives 249 industrial establishments outside iron and steel, with a capital

YPRES — YPSILANTI

of \$4,818,243; employees, 2,716; wages paid, \$1,458,821; cost materials, \$3,553,156; value products, \$6,597,245.

Finances and Banking.—The assessed valuation of the city is \$22,317,210 with tax rate \$33 but usually under \$30; bonded debt, \$880,304; annual interest charge, \$42,096. The city owns property valued at over \$2,500,000. City income by last annual reports, \$385,000; expenditures, \$378,000. Post-office receipts 1903, \$100,468. There are five national banks and one trust company with capital and surplus \$3,834,000 and deposits \$10,151,000.

Churches.—There are here 46 Protestant churches, chapels and missions, most numerous being Methodist 11, Presbyterian 10, Lutheran 8; 10 Catholic churches, with 1 Ursuline convent, and 2 Jewish synagogues. Of the churches 41 are English, 4 German, 3 each Welsh and Swedish, 2 Slovak, and 1 each Italian, Polish, and Arabic. The best church buildings are St. Columba's, St. John's, Trinity, and the beautiful Helen chapel.

Benevolent Institutions.—City hospital, with substantial limestone buildings, best modern equipment, cost \$200,000, and Mahoning Valley, conducted by Sisters of Charity; Y. M. C. A., with large membership and well sustained; Children's Home, Florence Crittenton Home, five free kindergartens, an active humane society, and various fraternal societies.

Education.—There are 22 public school buildings, 199 teachers, and 8,000 pupils enrolled; salaries and expenses 1903, \$178,500. The Rayen School, founded in 1854 by Judge William Rayen, with fine building and large grounds, is conducted as the city high school with 450 pupils. There are eight parochial schools with 36 teachers and 2,470 scholars, several private schools, and the Y. M. C. A. sustains good educational classes.

The R. McMillan Free Public Library is well managed, and has 20,530 volumes. The Rayen School has a good library.

Newspapers.—Two daily, *Telegram* and *Vindicator*, each with several other editions; three weekly; one Catholic monthly.

Government.—A biennial mayor, president of council, one councilman from each of seven wards and three at large, board of public service of three, solicitor, auditor, and treasurer. The board of public safety of two, sinking fund trustees, and board of health are appointed by the mayor; city engineer and clerk by council; other officers elected by the city.

Population increased from 8,075 in 1870 to 44,885 in 1900, and rapid growth since makes conservative estimate for end of 1903 over 56,000, besides several thousand belonging to city but outside the boundary. In 1900 the percentage of foreign born was 27.2; native of foreign parentage, 41, leaving but 31.8 of native parentage.

History.—The township was named from John Young, who purchased it from the Connecticut Land Company in 1796. David Tod, afterward "war governor," operated first coal mines and led in establishing the canal and first railroad. Sturdy foreign elements, attracted later by the heavy industries, have combined with descendants of early residents, largely from New England, and others, to form

an enterprising, industrious, upright and patriotic community whose future, with first-class plants established, is bright.

WILLIAM H. BALDWIN.

Ypres, è-pr, (Flemish, *Yperen*), Belgium, a town in the province of West Flanders, in a plain, on both sides of the Yperlèe, 28 miles south-southwest of Bruges, 53 miles by rail. Ypres formerly was one of the most important manufacturing towns of Flanders, and in the 14th century had 200,000 inhabitants and employed 4,000 looms. Its manufacturing prosperity has long departed, but a striking monument remains in its cloth-hall (Les Halles), an immense building of the 13th and 14th centuries, in the form of an irregular trapezium, surmounted by a square tower or belfry. One of its wings is used as the town-house, and other parts are occupied by different public establishments and concert-rooms. The Gothic cathedral of Saint Martin dates from the 13th century, and is one of the most remarkable religious edifices in Belgium. The chief manufactures are cottons and lace. Ypres was made by Louis XIV. in 1688 one of the strongest fortresses of the Low Countries, and in the great European wars seldom escaped a siege or bombardment. It is no longer fortified. Jansen (q.v.) was bishop of Ypres, and is buried in the cathedral of Saint Martin. Pop. (1900) 17,371.

Ypsilanti, ip-sì-làn'ti, a distinguished Fanariot family descended from the Comneni and of prominence as defenders of Greek liberties. Its most conspicuous members are: ALEXANDER: b. Constantinople 1725; d. 1805; hospodar of Wallachia 1774-82, and again in 1796-8, and of Moldavia 1784-92. He propounded a scheme for the fusion of the Greek and Turkish people, but having incurred the suspicion of the Porte, was executed. CONSTANTINOS, his son (b. Constantinople 1760; d. Kiev, Russia, 28 July 1816). He early planned the freedom of Greece, but his scheme was prematurely discovered, and he fled to Vienna. Pardon by the Sultan, he was hospodar of Moldavia 1799-1805. He then went to Russia, but returned to Bucharest with 20,000 men, in the hope of freeing Greece. The peace of Tilsit interrupting his plans, he returned to Russia. ALEXANDER, eldest son of the preceding (b. Constantinople 12 Dec. 1792; d. Vienna 31 Jan. 1828. He went with his father to Russia and, joining the Russian army, served with distinction in various campaigns. In 1820 he became head of the secret association known as *hetæria*, whose aim was the independence of Greece, and in March 1821 entered Moldavia and raised the standard of revolt among the Rumanians. He was defeated by the Turks at Dragaschen, near Galatz, 19 June 1821, fled to Austria, and was imprisoned six years at Munkacs, Hungary. DIMITRIOS, brother of the preceding (b. Constantinople 25 Dec. 1793; d. Nauplia 16 Aug. 1832). After serving in the Russian army, in 1821 he joined the Greek patriots in the Morea, and played a brilliant part in the struggle. But though a brave and successful general, as his victory at Tripolitza and his defense of Argos show, his influence was constantly undermined by the "native" party, who never forgot that he was a Fanariot, and therefore a foreigner in part. In 1827,

however, he was made commander-in-chief of the Greek army, but the ungenerous course adopted toward him by the government of Capo d'Istria compelled him to resign 1 Jan. 1830, and he then withdrew from public affairs.

Ypsilanti, Mich., city in Washtenaw County; on the Huron River, and on the Lake Shore & M. S., and the Michigan C. R.R.'s; 30 miles west of Detroit and eight miles southeast of Ann Arbor. It is on both sides of the river. In 1807 there was an Indian trading post on the site of the present city. In 1824 it was laid out as a town, became a village in 1832, and was chartered as a city in 1858. It has considerable manufacturing interests. In 1900 (government census) the total capitalization of the manufacturing establishments in the city was \$898,161; the value of the annual products was \$1,318,793. The chief manufactures are flour, paper, dairy products, underwear, agricultural implements, sash, door, and blinds, tags and labels, pumps, cement and foundry and machine shop products. The city is the commercial centre of a rich surrounding country. It contains 9 churches, and the Michigan State Normal College, a high school established in 1849, a business college, public elementary schools, kindergartens, and public and school libraries. The two banks have a combined capital of \$125,000, and, in 1903, had deposits amounting to \$1,056,570. The city owns and operates the electric-light plant and the waterworks. The government is administered under a charter of 1898, and is vested in a mayor, who holds office one year, and a common council of ten members. Pop. (1890) 6,129; (1900) 7,378.

Yreka, wī-rē'kə, Cal., city, county-seat of Siskiyou County; on the Yreka Creek, and on the Yreka Railroad; about 355 miles north of San Francisco. It is in an agricultural and lumbering region, in which considerable attention is given to fruit cultivation and stock-raising. There are large stock yards, a lumber mill, and fruit-packing houses. The city has one bank with a capital of \$100,000, and a county high school. Pop. (1890) 1,100; (1900) 1,263.

Yriarte, ē-rē-ār'tā, Charles Emile, French journalist and author: b. Paris 5 Dec. 1832; d. there 10 April 1898. He studied architecture as a pupil of Constant Dufeux, became inspector of imperial asylums, and after this post was abolished, went on the Spanish expedition to Morocco in 1859 as correspondent and artist for the *'Monde Illustré'*, and in 1860 on Garibaldi's campaign in Sicily in the same capacity. From 1864 to 1870 he was editor-in-chief of the *'Monde Illustré'*; in 1881 he was made inspector of fine arts, and in 1889 member of the superior council of fine arts. He wrote for the *'Figaro'*, and for *'La Vie Parisienne'* over the pseudonym 'Marquis de Villemer.' Among his numerous volumes of various character are: *'Portraits Parisiens'* (1865); *'Les Tableaux de la Guerre'* (1870), on the war in Morocco; *'Venise'* (1877); *'Autour du Concile'* (1887); and several works on the Italian Renaissance, such as *'Florence'* (1880); *'Matteo Civitali, sa Vie et son Œuvre'* (1885); *'Autour des Borgia'* (1890), and *'Maso di Bartolommeo dit Masaccio'* (1894).

Yriarte, or **Iriarte**, Juan de, Spanish linguist: b. Orotava, island of Teneriffe, 15 Dec.

1702; d. Madrid 23 Aug. 1771. In 1714 he was sent to school at Paris, afterward studying English in London and jurisprudence in Madrid, where he presently obtained a post in the royal library. In 1732 he became chief librarian and in 1742 translator for the ministry of foreign affairs. He published an important *'Codices græci manuscripti'* (1769), and wrote many Latin and Spanish epigrams and proverbs, Latin poems, etc., included in his *'Obras Suel-tas'* (4 vols. 1774).

Yriarte, or **Iriarte**, Tomas de, Spanish dramatist: b. Orotava, island of Teneriffe, 18 Sept. 1750; d. Madrid 17 Sept. 1791. He began to write in boyhood and in 1770 published his comedy, *'Hacer que hacemos'*, under the pseudonym, 'Tirso Ymareta.' In 1780 he published a didactic poem, *'La musica'*, and in 1782 *'Fabulas literarias'*, considered the best fables in the Spanish language. He also wrote the first regular comedies in Spanish, the best being *'The Spoiled Child'* and *'The Ill-Bred Young Lady'* (1788), and published Spanish translations of French plays, Horace's *'Ars Poetica'* (1777), and four books of the *'Aeneid.'* In 1771 he succeeded his uncle, Juan de Yriarte (q.v.) as royal librarian.

Ysaye, ē-sī-yē, Eugene, Belgian violinist: b. Liège, Belgium, 16 July 1858. He studied at the Liège Conservatory and subsequently with Wieniawski and Vieuxtemps at Brussels. He made many successful European concert tours and in 1880 became a professor in the Royal Conservatory of Brussels. He has originated a new school of violin playing, embracing features of the German, the French, and the Belgian schools, and is considered one of the leading violinists of the world. He visited London in 1889, and in 1894 and 1904 made concert tours in the United States.

Ysleta, ē-slā'ta, Texas, city in El Paso County; on the Rio Grande, and on the Texas & P., and the Southern P. R.R.'s; 12 miles east of El Paso. It is in a fertile agricultural region, the productive Rio Grande Valley, in which fruit and grains grow in abundance. In 1540 Coronado discovered here a village of Pueblo Indians. He founded here a colony, erected a church and provided teachers for the Indians. The city claims to be the oldest in the State. Several of the descendants of the Pueblos are residents of the city. Pop. (1890) 1,528; (1900) 1,771; about one third are citizens of the United States, and nearly all the others are Mexicans and Indians.

Yssel, i'sēl, or **Ijssel**, Netherlands, the name of several rivers, chief of which are: (1) the Nieuw Yssel, one of the principal arms of the Rhine, which leaves that river below Arnheim, flows northeast for 16 miles to Doesburg, where it receives the Oude Yssel from Westphalia, then northeast, north, and northwest, through Gelderland and Overijssel, past Zutphen and Deventer, receiving the Borkel and Schip-Beek, emptying at Kampen by many arms into the Zuyder Zee, and forming a constantly widening delta. It is one of the five main arms of the Rhine, is 320 feet broad at Zutphen, 764 at Kampen, and 90 miles in length. (2) The Neder Yssel, an arm of the Leck, which leaves that stream at Vianen, flows west through Utrecht, at Oudewater enters southern Hol-

YTTERBIUM — YUCCA

land and flows southwest past Gouda to join the Maas, forming at its mouth the island of Ysselmonde. Length 30 miles.

Ytterbium, a rare chemical element belonging to the Yttrium group. Discovered by Marignac in 1878 in the mineral gadolinite. Also found in other minerals occurring in Siberia, Scandinavia, and Greenland. Symbol, Yb.; atomic weight, 173. Its oxide Yb_2O_3 forms colorless salts with sulphuric acid, etc.

Yttrialite, a native silicate chiefly of thorium and the yttrium metals. It occurs in Llano County, Texas, in grayish-olive-green masses, associated with gadolinite, and other minerals which have been mined as a source of the rare earths.

Yttrium, a rare chemical element discovered 1794 by Gadolin in the mineral gadolinite from Ytterby. It is always found in combination, some of the minerals containing it being gadolinite, xenotime, euxenite, ytrotantalite and polycrase. Usually separated from the mineral by use of sulphuric acid or aqua regia. The element is obtained by heating the chloride with metallic potassium, by electrolysis of a molten mixture of the chloride and sodium chloride, or by heating the oxide with magnesium. It is a grayish-black, lustrous, metallic powder that burns in the air to the oxide Y_2O_3 . Soluble in dilute acids. Symbol Y. Atomic weight 89. Valence 3. It forms a great many compounds closely resembling aluminium, but unlike that element forms no alums.

Yuba, yoo'bä, a river in California, formed by the junction of three rivers, North, Middle, and South, which have their sources in the Sierra Nevada. The Yuba enters the Feather River just below Yuba City. In its upper course it has many picturesque gorges, and several cascades.

Yuba City, Cal., town, county-seat of Sutter County; on the Feather River, near the mouth of the Yuba River, and on the Southern Pacific Railroad; about 40 miles north of Sacramento. It is in a fertile agricultural region, in which fruits are among the important productions. The industries are chiefly connected with farm products. The town has one bank, Farmers' Co-operative Union of Sutter County, with a capital of \$50,000. Pop. (1890) 1,071; (1900) 1,488.

Yucatan, yoo-kä-tan', Central America, (1) a peninsula forming the southeastern boundary of the Gulf of Mexico and comprising the Mexican states of Yucatan and Campeche, British Honduras, and part of Guatemala. The combined area of the two states is 53,290 square miles; with British Honduras, 60,852 square miles. The capitals of the states of Yucatan and Campeche are Merida and Campeche respectively, and among other towns on the peninsula are Sisal, Izamal, Valladolid, Tixcotob, Progreso, and Bacalar. The peninsula is a limestone plain of coralline formation, and, except for some ridges in the south and in the centre, it has no hills. It has little wood, except near the coast, and surface water is almost wholly absent, though underground water is abundant. The water stored in natural caverns is reached by means of steps cut in the rock, and the Maya Indians formerly excavated large storage basins, many of which have become hot-

beds of fevers. Some of the many rock caves have been inhabited or used as refuges during periods of war or revolution. The climate is warm, and generally unhealthful. There are no minerals of importance. Some maize and rice are cultivated, but the principal vegetable product is henequen or sisal hemp. Logwood is a product of the forests. Salt is obtained on the coasts, and the fisheries are productive. Yucatan and the neighboring districts were the seat of ancient kingdoms of the Mayas, who were the most highly civilized of all the Central American aborigines, and whose descendants still form the bulk of the population. There are numerous splendid ruins of their ancient cities, notably those of Uxmal, 40 miles south of Merida, Izamal, east of Merida, and Chichen-Itza, southeast of Merida. The Spaniards first entered the country in 1506, and during 1527-42 they effected its conquest. (2) A northeastern state of Mexico with an area of 35,203 square miles. Pop. (1900) 312,264.

Yuc'ca, the name of a genus of shrubs with clustered ensiform leaves, belonging to the *Liliaceæ*, but also employed as a common name to designate the plants belonging to the entire botanical family of yuccas. This includes not only the genus *Yucca* but several other genera, as *Samuella*, *Clistoyucca*, *Hesperaloe*, etc. The species are chiefly found in the United States and Mexico, though some of them are distributed to many portions of the world. The best known species in the United States is *Yucca filamentosa*, or Adam's needle, which is found in cultivation as far north as New England, its clusters of large white, bell-shaped flowers making it a favorite in gardens. Until recently none of the species has been regarded as valuable commercially, though the coarse fibre of *Y. filamentosa*, called bear-grass, has long been used in a small way as tie material in the South. In Mexico, however, there are several species with larger leaves that have of late years been exploited for their fibre, which is becoming known as a rather coarse substitute for the better cordage fibres. *Yucca australis*, *Hesperaloe funifera*, and *Samuella carnerosana* especially are used in northern, eastern, and central Mexico for fibre, which is derived from the *cogolla* or central spike of unopened leaves, the *cogollas* first being steamed, and the individual leaves scraped with a dull-edged iron tool, upon a block of wood, and the fibre extracted. This coarse fibre is known as palma istle, pita sylvestris, zamandoque, etc. Yucca fibre is stiff, harsh, and brittle, and as prepared is not always of good color, and therefore can never take rank with the better known hard cordage fibres. (See FIBRE.) *Yucca baccata* yields a fairly good fibre, and the parenchyma or pith, and the root possess detergent qualities, from which the name soap-plant has been derived. The sun-cured, whitish yellow inner leaves of *Yucca glauca* are used by the Arizona Indians for ornamental basketry, either entire or subdivided, and several other species are also employed in the domestic economy of North American Indian tribes for rude cordage, baskets, sandals, mats, etc.

A very remarkable feature in the yucca is its fertilization by the aid of any of several species of small whitish moths of the tineine genus *Pronuba*. The yucca flowers are so

YUCHEE — YULE

shaped as to be impossible of fertilization, and no other insects attach themselves to this plant. The yucca moth gathers a quantity of pollen in its jaws, then lays an egg in the pistil, and stuffs the hole in which it is laid with pollen, thus fertilizing the ovary. The caterpillar develops in the fruit-pod, but does not seriously harm the plant. This extraordinary case of symbiosis was disclosed by C. V. Riley in 1872, and may be found fully related by him in the 'Fourth Annual Report' of the State entomologist of Missouri.

Yu'chee. See UCHEAN.

Yuga, yoo'gā, or Yooga, one of the periods into which the past history of the globe is divided in the chronology of the Hindus. There are four yugas: The Satya Yuga, containing 1,728,000 years; the Treta Yuga, 1,296,000; the Dwapara Yuga, 864,000 years; and the Kali Yuga, now in progress, which began about 3094 B.C., and which will extend to 432,000 years. Horace Hayman Wilson points out that these numbers originate in the descending arithmetical progressions of 4, 3, 2, 1, according to the notions of diminishing virtue in several ages applied to a cycle of 12,000 divine years, each equal to 360 years of mortals; and $12,000 \times 360 = 4,320,000$, the periods of the four yugas added together. See INDIA.

Yukian (adjectival form of the Wintun *yuki*, "stranger," also "bad," "thieving"), a linguistic stock of North American Indians, consisting chiefly of the Ashochimi, Chumaya, Napa, Tatu and Yuki tribes, which formerly occupied Round Valley and the area extending therefrom to the California coast. The Round Valley reservation was subsequently established to receive these and other tribes, and most of their representatives now reside thereon. The entire group numbers only a few hundred at most. The original home of the Ashochimi was near the present Healdsburg; the Chumaya occupied middle Eel River; the Napa, upper Napa Valley; the Tatu, Potter Valley; and the Yuki, Round Valley.

Yukon, yoo'kōn, North America, (1) a large river, mainly in the United States Territory of Alaska, which rises as the Lewes in British Columbia, about lat. 59°, and after a tortuous north, west by south, and northwest course of 2,044 miles, flows into Bering Sea, on the southern shore of Norton Sound, through a many-channeled delta from 80 to 90 miles wide. The northernmost channel of the delta, the Aphoon Mouth, is the only one navigable. The main stream of the Yukon is formed at Fort Selkirk in 63°, by the junction of the Lewes and the Pelly, the former being constituted by the junction of the Big Salmon and Teslin flowing from Teslin Lake and draining a group of small lakes in the region around Mounts Landsowne and Lorne. From Fort Selkirk the Yukon flows northwest with many windings, passing through the Klondike gold-field, receiving from the right the Stewart River, and at Dawson the Klondike, and from the left the White River, Sixty Mile Creek, and Forty Mile Creek. It enters Alaska in about 65° N., and continues its northwestern course until the Arctic Circle is reached, when at the abandoned Fort Yukon, it is joined on the right by the Porcupine River, bends sud-

denly, almost at right angles, and thenceforward has a general southwestern trend to its mouth.

The chief Alaskan tributaries of the Yukon are the Kozukuk on the right bank, and the Birch and Tanana on the left bank. Its whole course of 1,260 miles through Alaska is navigable by stern-wheel steamers, and beyond to Dawson in Canada; since the discovery of gold throughout the region in 1897 a regular summer service is maintained; the first impracticable obstruction to navigation is at the Grand Cañon, 1,866 miles from the mouth. In its lower course the Yukon is a broad, muddy stream flowing mostly through a marshy plain and for nearly nine months of the year, from October to June, frozen over; its upper course is through the grand scenery of narrow mountain valleys, and rocky gorges. The Yukon is the largest American river flowing into the Pacific; it is the 17th river of the world as to length, the seventh of the Western hemisphere, the fourth of the North American continent, and the third in the United States. This last assertion is based on its whole length of 2,044 miles, however, but taking only that portion which is in the United States, or Alaska, 1,260; it is the fifth river of our country, the Mississippi, Missouri, Arkansas, and Ohio rivers being longer. Its length in navigable miles is 2,036, there being but four rivers in the world with a greater capacity, the Amazon, the Mississippi, the Missouri, and the Saint Lawrence. (2) The Yukon Territory, Canada, named after the river, was formerly a district of the Northwest Territories. It was created a separate territory in 1898 after the discovery in the preceding year of immense quantities of gold on the Klondike River and its tributaries had brought it into prominence. It lies north of British Columbia, and is the westernmost territory, bordering on Alaska, U. S. Its area is estimated at 192,000 square miles; pop. (1901) 27,219. See ALASKA; ALASKA, RECENT DEVELOPMENT OF; KLONDIKE.

Yukon Gold Fields. See ALASKA; CAPE NOME; KLONDIKE.

Yulan, a Chinese tree. See MAGNOLIA.

Yule, yool, Sir Henry, British geographer and Orientalist: b. Inveresk, Midlothian, Scotland, 1 May 1820; d. London 30 Dec. 1889. He entered the East India Company's military college at Addiscombe in 1837, in 1840 was appointed to the Bengal Engineers, and in 1855 became under-secretary to the public works department. In 1858 he published a 'Narrative of the Mission to the Court of Ava in 1855.' He left India in 1862 and in 1864 took up his residence at Palermo, Sicily, in order to continue and extend the researches which led to the publication of his great work, 'The Book of Sir Marco Polo, the Venetian, Concerning the Kingdoms and Marvels of the East,' newly translated and edited, with notes, etc. (1871, enlarged ed. 1875). In 1875 he returned to England, and from that year till 1889 was a member of the Indian Council. His great work gained him the founder's medal of the Royal Geographical Society. His other works include: a treatise in 'Fortification,' which was used as a text-book; 'Cathay and the Way Thither' (1866); 'Notes on Hwen Thsang's Account of the Principalities of Tokharistan' (1872);

'Hobson-Jobson: a Glossary of Anglo-Indian Colloquial Words and Phrases, and of Kindred Terms, etc.' (1886), with A. C. Burnell; 'The Diary of William Hedges' (1887-9), edited for the Hakluyt Society, of which he was for many years president.

Yule, the old English name for Christmas, still used provincially. See CHRISTMAS.

Yu'lee, David Levy, American politician: b. West Indies 1811; d. New York 1886. In boyhood he came with his father, whose name was Levy, to Richmond, Va., where he was educated. Sent to Florida in 1824, he there studied law, and being elected to Congress from that territory, served from 1841 to 1845, changing his name at this time from David Levy to David Yulee. He was United States senator from Florida 1845-51, taking a prominent part in senatorial debates, and again 1855-61, when he resigned on account of the Civil War. He was then made a member of the Confederate Congress. After the war he became president of the Atlantic & Gulf Railroad, and was interested in the commercial development of Fernandina and Cedar Keys, Fla.

Yuma, yoo'ma, Ariz., city, county-seat of Yuma County; on the Colorado River, and on the Southern Pacific Railroad; 150 miles southwest of Phoenix. It is in a mining region in which there are considerable productive farm lands on which are raised grains and fruits. There is one bank, four churches, and graded public schools. Pop. (1890) 1,773; (1900) 1,402.

Yung Wing, yoong'wīng', Chinese diplomatist and scholar: b. Nan Ping, province of Kwang Tung, 17 Nov. 1828. After graduation from Yale in 1854, he was in the silk and tea trade until 1864, and then entered the governmental service of China. The China Steam-navigation Company was established on his initiative, as was also the Chinese Educational Mission, for the education of Chinese in America. Yung Wing was made chief commissioner of this enterprise, for which an appropriation of \$1,500,000 was made. He was granted the rank of mandarin of the second grade, and appointed intendant of Kiang-Su province; and was for some time associate-minister to the United States, where he took up his residence in 1902.

Yunnan, yŭn-nān', China, the most southwesterly province of the empire bordering on Tonkin and Burma; area, about 146,680 square miles. It is very mountainous in the north and west, and has a general slope toward the southeast. The central part is a plateau about 6,500 feet above sea-level, dotted with lakes and diversified by hills of red sandstone; but in the south the elevation of the land is much less. The province is traversed by several large rivers, principally the upper courses of the Yangtse-kiang (called Kin-cha-kiang), the Si-kiang, the Song-ka or Red River, the Mekong, and the Salwin, but only the Song-ka can be regarded as of use for navigation within the province. The principal crops are rice, opium, and wheat, but tea, indigo, sugar-cane, cotton, earth-nuts, and many vegetables also are cultivated. Cattle, sheep, hogs, and other animals are reared in considerable numbers, and silk-worm-rearing is also extensively carried on.

The chief wealth of the province, however, lies in its immense mineral resources, which include iron, coal, copper, gold, silver, lead, tin, zinc, cinnabar, and precious stones. The manufacturing industries include the making of silk goods and other textiles, leather goods, etc. The climate varies from the rigor of the northern districts, where the mountains are snow-capped for the greater part of the year, to the comparatively tropical condition of the southeast. A large part of the population consists of Miao-tse and other non-Chinese elements, and Mohammedanism has many adherents. Yunnan, the capital, in the southeast, is a busy and prosperous town, with large copper factories, and manufactures of silks and carpets. (Pop. 200,000.) Other towns are Chaotung, Tali-fu, Momein, Lingang-fu, Puerh, Tung-chwan, Mengtse, and Ssumao, the last two being open to foreign trade since 1889 and 1897 respectively. The British have endeavored to establish a direct trade route between Yunnan and Burma, but from the physical features of the region this is not easy. The history of Yunnan can be traced back to the 3d century B.C. Owing to its distance from the seat of the central authority and its mountainous character this province long remained practically independent. The most noteworthy event of its recent history is the great Panthay revolt of 1855, which was not suppressed by the Chinese authorities till 1873. Pop. estimated at 12,324,574.

Yupanqui Pachacuti, yoo-pān'kē pā-chā-koo'tē, or Pachacutec **Yupanqui**, Peruvian inca: b. about 1380; d. about 1440. He was the ninth ruler of the Inca line of sovereigns, and one of the greatest. He was the second son of the Inca Viracocha and after deposing or superseding his imbecile elder brother, Urco, he defeated the Chancas in a great battle, annexed their territory to his own and continued his successful career till the Inca kingdom included nearly all of what is now the republic of Peru. In order to relieve the congested condition of Peru he developed a system of colonies called mitimacs. Yupanqui figures largely in Quechua tradition and various national institutions have been traced to him.

Yu'rok. See WEITSPEKAN INDIANS.

Yuruary, yoo-roo-ä'rē, a river of Venezuela, rising to the east of the Caroni and flowing eastward to join the Cuyuni in about lon. 61½° W., near the frontier of British Guiana. It gives its name to the Yuruary territory claimed by both Venezuela and Great Britain until 1899, when the award of an arbitration court gave most of it to Venezuela. There are several gold-fields here, including El Callao, etc.

Yurucares, yoo-roo-kä-rās', or **Yurucare**, Indians of Bolivia occupying the forest plains on the eastern slope of the Andes between the rivers Mamore and Beni. They include several tribes, are tall and shapely, and are almost white. They are hunters and warriors for the most part and their mythology is intricate and confused. Prior to the expulsion of the Jesuits, in 1767, numbers of them were attached to the Chiquito missions.

Yusuf, yoo's'uf, or **Yussuf**, **Abu Amru**, Arabic historian: b. Cordova 976; d. Xativa 1070. He was profoundly versed in the tradi-

tions of the Oriental Mussulman countries and wrote: 'Behedjet-Almodjalisyn,' a collection of tales relating to Mohammed, etc.; 'Tamhyd,' a commentary on one of the chief Mussulman works of religious and civil law; 'History of the Opinions and Doctrines of the Principal Mussulman Sects'; 'History of the Wars Against the Christians'; etc.

Yusuf, or **Yussuf-Ben-Taxfyn**, yoo's'ûf-bên-tâsh-fên', Moorish prince: b. Velad Sahara; d. 1106. He was the second prince of the Almoravide line and in 1086 aided the Emir of Seville, Al-Mo'tamid, to gain the victory over Alfonso VI. at Zalaca near Badajos. In 1090 he again invaded Spain, at the call of the emir of Seville, and taking advantage of Mohammedan dissensions gradually acquired the sovereignty of the kingdoms of Malaga, Grenada, Murcia, Cordova, Seville, Almeria, Badajoz, and Valencia, which he united to the kingdom of Morocco. Yusuf never assumed a higher title than that of emir, and in 1103 his son Ali was acknowledged heir of both his Spanish and Moorish possessions. Consult Freeman, 'History and Conquests of the Saracens' (1856); Yonge, 'Story of the Christians and Moors in Spain' (1878); Coppée, 'History of the Conquest of Spain by the Arab-Moors' (1881).

Yuthia, yoo'thê-â, or **Ayodhya**, the former capital of Siam. See AYUTHIA.

Yverdon, ê-vêr'dôn (German, *Ifferten*), Switzerland, a town in the canton of Vaud, at the southwestern extremity of Lake Neuchâtel. Its castle, built in 1135, was used by Pestalozzi (q.v.) as an educational establishment in 1805-25, and now contains a library and museum. The town has also a fine town-house, a hospital, and a memorial of Pestalozzi; and among the manufactures are railway wagons and materials, beer, etc. Yverdon was the *Eburodunum* of the Romans, and there are remains of the ancient walls. Pop. (1900) 7,985, mostly French-speaking Protestants.

Yves D'Evreux, êv dâv-rê, **Pierre**, Franco-Brazilian historian: b. Evreux, Normandy, France, about 1577; d. after 1620. He became

a member of the Capuchin order in 1595 and was sent in 1612 with four missionaries as their superior, to Maranhao, Brazil, where a French colony had been established. He returned in 1614 and wrote: 'History of the Most Memorable Things that Happened at Maranhao in the Years 1613 and 1614' (Paris, 1615; 2d ed. 1864), a continuation of the history of Claude d'Abbeville, a work of great historical value.

Yvetot, êv-tô, France, a town in the department of Seine-Inférieure, on an elevated plain, 23 miles northwest of Rouen. It has manufactures of calico, hosiery, linen, leather, and baskets. Antiquaries have been much puzzled by an ancient chronicle, and still earlier edict, which gave the title of king to the lords of Yvetot. This edict was formally abrogated in 1681. 'Le Roi d'Yvetot,' the well-known song by Béranger, translated by Thackeray, was a satire on Napoleon, which has immortalized the ancient dignity. Pop. (1901) 7,352.

Yvon, ê-vôn, **Adolphe**, French historical painter: b. Eschwiller, Moselle, 1 Feb. 1817; d. Paris 11 Sept. 1893. He studied under Paul Delaroche, traveled in Russia in 1843, and brought back with him a series of designs exhibited in Paris in 1847-8. He obtained the medal of honor at the Salon of 1857, 10 years later became an officer of the Legion of Honor and was professor of drawing at the Ecole des Beaux Arts, Paris. In 1855 he was commissioned by the French government to accompany the army to the Crimea. Among his most important works are: 'The Remorse of Judas' (1846); 'The Battle of Kolikova' (1850); 'The First Consul Descending the Alps' (1853); 'Marshal Ney Supporting the Rear Guard in Russia' (1855); 'The Seven Deadly Sins,' designed after Dante (1855); 'The Capture of the Malakoff' (1859); 'Battle of Solferino' (1861); and an allegorical picture of 'The United States of America' (1870), executed for A. T. Stewart. He was an artist of remarkable power and holds a prominent place among the historical painters of France.

Z the twenty-sixth of the letters of the English alphabet, is a vocal or sonant consonant, as distinguished from *s*, which is the corresponding fricative sibilant. It was adopted into the Latin from the Greek alphabet in the time of Cicero: in the Latin alphabet, as in our own, it holds the last place; but in the Greek its place is sixth, and in the Phœnician, Hebrew, and other Semitic alphabets seventh. In German and Italian it represents the sound of *ts*; in our language and in French it represents one simple sound. In Latin it was used only in words derived from the Greek. The exact value of zeta in Greek is not known with certainty; but beyond any question it stood for a double sound, not a simple sound like our *z*; this is conclusively inferred from Aristotle's remark that *xi* (ξ), *psi* (ψ), and *zeta* (ζ) are like in sound; and the inference is strengthened by the fact that in Greek prosody a vowel short by nature is made long by position when it occurs next before the zeta. The sound of the zeta, however, is in doubt—whether it was *dz* or *sd* or both. The name of *Z* in Great Britain is *zed*, in the United States *zee*. Though *z* is the alphabetic representative of the sonant sibilant, the special *z*-sound is in English oftener represented by *s* than by *z*.

Z-Bars. See RAILS AND STRUCTURAL SHAPES.

Zaandam, zān-dām', or **Saardam**, Netherlands, a town in the province of North Holland, five miles northwest of Amsterdam. It lies on a plain at a dam on the Zaan, whence its name. The chief edifices are the town-hall, and the house occupied by Peter the Great of Russia during his eight days' residence here, when he came to study shipbuilding. He would not remain longer on account of the throngs of inquisitive spectators, and left for Amsterdam. There are corn, oil, and saw mills, paper and tobacco works. The shipbuilding, whale-fishing, and shipping trade have almost ceased to exist. Pop. (1900) 21,597.

Za'biāns, a term not identical with Sabæans, but properly meaning certain non-Christian Gnostics, predecessors of the peculiar sect called Mandæans, still surviving in South Babylonia. The Syrian Zabians were the survivors of the ancient Syrian heathen who, being under Mohammedan rule, took the name of Zabians in order to share the toleration which the followers of Mohammed extended to the real Zabians. They were a highly cultured people, and produced many learned men. This sect became extinct about the 12th century. See MAN-DEANS.

Zacatecas, tzā-kā-tā'kās, Mexico, (1) the capital of Zacatecas state, on the Mexican Central Railway, 440 miles northwest of Mexico

City. It is a famous silver-mining town, built in a deep ravine, 8,000 feet above sea-level. The narrow and irregular streets rise in terraces; there are numerous plazas and on the spacious central market stands the handsome 17th century cathedral. Over 15,000 men are employed in the neighboring mines which since 1540 have yielded above one billion dollars worth of silver. The city was founded in 1546. Pop. (1904) 39,900. (2) A state bounded by Coahuila, San Luis Potosí, Aguascalientes, and Durango; area, 24,757 square miles. It is a mountainous and arid tract, with a rigorous climate, and little arable land. Sugar-cane, cereals, and cotton are grown in a few southern fertile portions. The table-land, which forms the central part, rises to upward of 6,500 feet above the level of the sea. It has great mineral wealth, especially in silver, and some of its mines have been worked for centuries. Pop. (1900) 462,886.

Zaccheus, ză-kē'ūs, or **Zacchæus**, a Hebrew tax-gatherer near Jericho. Being short of stature he climbed into a sycamore tree to behold the passing by of Jesus (Luke xix. 1-10).

Zacharia, tsä-ha-rē'ä, **Heinrich Albert**, German publicist: b. Herbsleben, Saxe-Gotha, 20 Nov. 1806; d. Kannstadt 29 April 1875. He was graduated from the University of Göttingen in 1829, was lecturer there in 1835-42, and in 1842 became professor of law. He took active part in the political movement of 1848 as a member of the National Parliament; in 1866 he opposed annexation to Prussia; and in 1867 took a leading part in the convention which framed the constitution of the North German Confederacy. He wrote: 'German States' Rights and Federal Rights' (1841); 'Manual of German Criminal Procedure' (1860); 'German Constitutional Laws of the Present Time' (1855); 'The Question of the Competence of the Empire in View of the Dogma of Infallibility.'

Zachariä, tsä-ha-rē'ä, **Just Friedrich Wilhelm**, German poet: b. Frankenhausen 1 May 1726; d. Brunswick 30 Jan. 1777. After studying at Leipsic and Göttingen he became professor of belles-lettres in the Carolinum, Brunswick, and in 1761 at Halle. He wrote: 'Der Rennomist' (The Brawler) (1744), the first burlesque heroic poem that had appeared in German; 'Fables and Tales' (1771), etc.; and translated into German hexameters Milton's 'Paradise Lost' (1760). Consult: Zimmer, 'Zachariä und sein Rennomist' (1892); Zimmerman, 'Friedrich Wilhelm Zachariä in Braunschweig' (1897).

Zachariä von Lingenthal, fön ling'ën-täl, **Karl Eduard**, German writer on jurisprudence, son of K. S. Zachariä von Lingenthal: b. Heidelberg 21 Dec. 1812; d. Grosskmehlen,

near **Mosburg**, 3 June 1894. He is regarded as the founder of the science of Græco-Roman jurisprudence. His works include: 'Outline of a History of Græco-Roman Jurisprudence' (1839); 'History of Græco-Roman Private Right' (1864); 'Græco-Roman Laws' (1856-84); 'Paralipomena ad Basilica' (1893); and an edition of Justinian's 'Novellæ' (1881-91).

Zachariä von Lingenthal, Karl Salomo, German jurist: b. Meissen, Saxony, 14 Sept. 1769; d. 27 March 1843. He studied at Leipsic and Wittenberg, was professor of law at the latter university, 1797-1807, and filled the same position at Heidelberg, 1807-43. He wrote: 'The Unity of State and Church' (1797); 'Forty Books on the State' (2d ed. 7 vols., 1839-43); 'Hand-Book of French Civil Law' (8th ed. 1894-5); etc.

Zacharias, zâk-a-rî'as, father of Saint John the Baptist, and husband of Saint Elizabeth. He was a priest of the temple of Jerusalem, and was stricken dumb on refusing to believe the announcement, made by the angel Gabriel, that a son should be born unto him; but recovered his speech at the birth of Saint John the Baptist. He is supposed to have been put to death by Herod (Luke i. 5-79).

Zacharias, or **Zachary**, **Saint**, pope of Greek birth; d. Rome 14 March 752. He succeeded Saint Gregory III. in the papal chair in 741 and at his death was followed by Stephen II. He exercised a powerful influence over several of the Lombard kings, obtaining the restoration of various cities and territories which had formerly been subject to the papacy, and gave his consent to the setting aside of the Merovingian Childeric III. and the elevation of Pepin the Short to the French throne (752).

Zacharias. See ZACHARIAH.

Zacher, tsah'ër, **Ernst Julius August**, German philologist: b. Obernigg, Silesia, 15 Feb. 1816; d. Halle 23 March 1887. He was educated at Berlin and Breslau and was professor of German philology in Halle 1856-9, and 1863-87. His works, which are greatly prized by students, include: 'Ulfilas' Gothic Alphabet and the Runic Alphabet' (1855); 'German Proverbs' (1852); 'History of the Palgrave Geneveva' (1860); 'Pseudo - Callisthenes' (1867), dealing with the Alexander myth, etc.

Zack. See KEATS, GWENDOLINE.

Zacynthus, zâ-kîn'thüs. See ZANTE.

Zadkiel, zäd'ki-ël, (1) According to Jewish legend the angel of the planet Jupiter. (2) A pseudonym adopted by William Lilly (b. 1602; d. 1681), the astrologer. (3) The name assumed by Richard James Morrison (b. 1794; d. 5 Feb. 1874), compiler of an astrological almanac, begun by him in 1830, and which reached an annual sale of from 100,000 to 200,000 copies.

Zadok, zä'dök, (1) A high priest of Israel, contemporary with David. (See SADDUCEES.) (2) A personage in Dryden's 'Absalom and Achitophel,' intended as a portrayal of Archbishop Sancroft.

Zaffarin Islands, a group of three islands lying off the coast of Morocco, near the Algerian frontier. They are at the mouth of the Muluva River and shelter its harbor. They have belonged to Spain since 1848. The central island is fortified. Pop (1900) 426.

Zaffre, in chemistry, an impure oxide of cobalt containing some arsenic and made by roasting speiss cobalt. Used in place of smalt in painting on cheap glass and porcelain ware.

Zagazig, za-ga-zëg', or **Zakazik**, Egypt, the chief town of the province of Sharkieh, in the delta of the Nile, on the Muizz and Fresh-water canals, connected by rail with Cairo, Alexandria, and Suez, 40 miles north-northeast of Cairo. The great number of factories, with their tall chimneys, and the structure of the houses, give the place a European appearance, and testify to the industrial activity which prevails. Nearly all the cotton grown in the eastern Delta is sent here to be cleaned, sorted, and partly spun before being put on the market. The town is also a centre of the grain trade, and has rapidly increased in prosperity and population since its connection with Suez by the Fresh-water Canal. The excavated ruins of ancient Bubastis are in the vicinity. Pop. (1897) 35,715.

Zagoskin, zâ-gös'kîn, **Mikhail Nikolaievitch**, Russian author: b. government of Penza 1789; d. Moscow 1852. For some time he held a post in the department of mines at St. Petersburg. His comedy, 'The Scapegrace,' was praised by Prince Tschakovski, a dramatist of influence, and he wrote a number of others which had some success but were deficient in originality. His efforts in the domain of historical fiction, with Scott as a guide, were more worthy, the chief being 'Yuri Miloslavski' (1820). There were half a score of others, their subjects derived from Russian history or legend. Their patriotic quality assured them an audience on their first appearance, and that they do not yet lack for readers is shown by the commencement of a complete edition of his works in 1898. There is a Russian biography by Aksakov in an edition of selected works published in 1858.

Zahn, zäm, **John Augustus**, American educator: b. New Lexington, Perry County, Ohio, 14 June 1851. He was graduated at Notre Dame University in 1871 and entered the Order of the Holy Cross the same year. Appointed to the charge of the scientific department of Notre Dame in 1874, he became director in 1875, and vice-principal and director of studies in 1876. He has been provincial of the Order of the Holy Cross since 1897, has lectured extensively, and is known as an advanced evolutionist. His publications include: 'Evolution and Dogma'; 'Sound and Music'; 'Catholic Science and Catholic Scientists'; 'Scientific Theory and Catholic Doctrine'; 'Science and the Church'; etc.

Zahn, tsän, **Johann Karl Wilhelm**, German architect, painter, and art critic: b. Rodenberg, Schaumburg, 21 Aug. 1800; d. Berlin 22 Aug. 1871. He became professor in the Academy of Arts, Berlin, 1829, and among his writings were: 'The Most Beautiful Ornaments and the Most Notable Pictures from Pompeii, Herculaneum, and Stabiæ' (1828-30); 'Ornaments of All Classical Periods of Art' (1832-9).

Zahn, **Theodor**, German theologian: b. Mörs, Prussia, 10 Oct. 1838. After studying at Basel, Erlangen, and Berlin he became professor of theology in the University of Göttingen in 1871. He filled a similar chair at Kiel

ZÄHRINGEN — ZAMBALES

in 1877, at Erlangen in 1878, at Leipsic in 1888 and in 1892 returned to Erlangen. Among his works may be named: 'Marcellus of Ancyra' (1867); 'The Shepherd of Hermas' (1868); 'Ignatius of Antioch' (1873); 'The Acts of St. John' (1880); 'Cyprian of Antioch and the German Story of Faust' (1882); 'Researches Into the History of the New Testament Canon' (1881-93); 'The Gospel of Peter' (1893); 'Introduction to the New Testament' (1897).

Zähringen, tsä'ring-ën, the house from which the reigning grand-ducal family of Baden (q.v.), Germany, takes its origin. The name is derived from the castle of Zähringen, now in ruins, in the village of that name, about two miles north of Freiburg in Baden. The founders of the family were from the 8th to the 10th century Counts of Breisgau, but the history of the house really begins with Duke Bertold I., "the Bearded," who began to rule in the first third of the 11th century.

Zaire, zä-é'rá, Africa, a name given to the Kongo River in part of its lower course.

Zakazik, zä-kä-zék', Egypt. See ZAGAZIG.

Zaleski, zä-lës'kī, Bohdan, Polish poet: b. Bohaterka in the Ukraine 14 Feb. 1802; d. Villepreux, near Paris, 31 March 1886. He studied at Warsaw and being obliged to leave his country after the revolution of 1830, he went to France. Many of his poems depict in the most vivid manner the scenery of Poland. His chief works are: 'The Spirit of the Steppes' (1842); 'The Most Holy Family'; and collections of shorter poems.

Zaleucus, zä-lü'kü's, the legendary law-giver to the Epizephyrian Locrians, the Greeks who colonized Magna Græcia, the southwest extremity of Italy. He is supposed to have flourished in the middle of the 7th century B.C. and his code is said to have comprised the first written laws of the Greeks. According to tradition his laws were exceedingly severe.

Zalinski, zä-lin'skī, Edmund, "LOUIS GRAY," American soldier and inventor: b. Kurnich, Prussian Poland, 13 Dec. 1849. Coming to the United States in 1853 with his parents, who settled at Seneca Falls, N. Y., he was educated at the Syracuse High School, and entered the army in 1864 as volunteer aid on the staff of Gen. N. A. Miles. He was appointed second lieutenant 5th United States Artillery in 1866, and captain in 1887. He was professor of military science at the Massachusetts Institute of Technology 1872-6, and was graduated in 1880 from the United States Artillery School at Fort Monroe and the School of Submarine Mining at Willett's Point, N. Y. From 1883 to 1889 he devoted himself to the development and perfecting of a pneumatic dynamite torpedo gun. Among his inventions are an intrenching tool, a ramrod bayonet, a telescopic sight for artillery and a system of range and position finding for sea-coast and artillery firing. He retired from active service in 1894. See ORDNANCE.

Zalinski Gun. See ORDNANCE.

Zalokos'tas, Georgios, Greek poet: b. Syrrhako, Epirus, 17 April 1805; d. Athens 3 Sept. 1858. An ardent patriot, at 16 he fought in the insurrection at Missolonghi. Greek children are taught his songs, and among his best-known poems are: 'Missolonghi'; 'Armatoles

and Klepts'; 'The Entrance of Prevesa'; 'Hours of Leisure'; 'Marco Bozzaris'; etc. Several of his verses have been translated into Italian, Spanish, English, German, French, and Russian. His 'Poetical Works' were published at Athens in 1860.

Zaluski, zä loos'kē, Josef Andrezei, Polish prelate and scholar: b. Poland 1702; d. 9 Jan. 1774. After serving for three years at Rome as ambassador to Pope Clement XII. he was made bishop of Kiev, but was banished to Kaluga for his opposition to the Dissidents. He is chiefly remembered for the service he did in awakening Polish literature. He spent his fortune in collecting a great library, which he bequeathed to Poland, but which was taken by Russia after the partition, and formed the nucleus of the Imperial Public Library.

Zama, zā'ma, North Africa, the name of two ancient cities about 30 miles apart, 100 miles southwest of Carthage, now represented by Djama and Sidi Amor-Djedidi. Both claim to be the scene of the victory of Scipio Africanus over Hannibal, which decided the fate of Carthage 202 B.C. It led to an ignominious peace which closed the Second Punic War 201 B.C. The Romans lost about 2,000 killed and wounded, while the Carthaginians lost in killed and prisoners over 40,000.

Zamacois, thā-mā-kō'ēs, Eduardo, Spanish artist: b. Bilbao, Vizcaya, 1842; d. Madrid 14 Jan. 1871. He was a pupil in Madrid of Balaca, Federico de Madrazo, and the Academy; in Paris of Meissonnier and the Beaux-Arts; and has been ranked as second to only Fortuny among Spanish genre-painters of the 19th century. His subjects were drawn largely from the 16th and 17th centuries, and frequently treated in a satirical vein. His technical finish has been described as "almost as perfect as Meissonnier's." Among his paintings are: 'The Hunchback'; 'Spanish Recruits'; 'The Bull Fighters'; 'Indirect Taxes'; 'A Court Jester of the 16th Century'; 'The King's Favorite' (1867); 'Cervantes as a Recruit'; 'The Rival Confessors' (1868); 'Return to the Convent' (1869); 'The Education of a Prince' (1870); 'The Puzzled Musician.' Very many of his works are in private collections in the United States.

Zambales, thām-bā'lās, Philippines, a province of Luzon, in the southwestern part of northern Luzon; bounded on the west by the China Sea; on the north by Lingayén Gulf; on the east by Lingayén Gulf, and the provinces of Pangasinán, Tárlac, and Pampanga; and on the south by Bataan; length 120 miles; width, 28 miles in the southern part, 25 miles in the northern part, and 12 miles in the central part; area, 2,160 square miles; with dependent islands, 2,210 square miles. A chain of mountains near the eastern boundary parallels the coast; and there are also two groups of peak, but a few miles inland from the coast. There are numerous short rivers, and several thermal springs in the province. The chief industry of the province is agriculture; rice and wheat of superior quality are the special products; sugar, cotton, tobacco, and coffee are also extensively cultivated. Next to agriculture in importance is the raising of cattle, horses, carabaos, and hogs. The mechanical industries are very limited and primitive; copper and coal are mined; and there are

ZAMBESI — ZAMBOANGA

indications of iron. The forest products are valuable, and amber is collected in considerable quantities on the coast. There are but few roads, and these are mostly impassable in the rainy season; a road and telegraph line parallel the coast for the greater part of the distance. Civil government was established in August 1901, and the provincial governor reported the province in a peaceful and prosperous condition in January 1902. Pop. (1903) 101,381.

Zambesi, zām-bě'zē, or **Zambezi**, South Africa, a river rising in Portuguese West Africa, in lat. $11^{\circ} 21' 3''$ S., and lon. $24^{\circ} 22'$ E., and reaching the Indian Ocean at Chinde and Conceição in Portuguese East Africa, opposite Madagascar, after a total course of 1,650 miles, of which the middle part belongs wholly to Rhodesia. The Victoria Falls and the Kebrabasa Rapids, the former in the west of Rhodesia and the latter in Portuguese East Africa, above Tete, are regarded as dividing the river into three sections, the Upper, Middle, and Lower Zambesi. The neighborhood of the source has an altitude of about 5,000 feet, and the river has its origin in a deep depression at the base of steep undulations, where the water oozes from a black marshy bog and quickly collects into a well-defined stream. Another head-stream of the Zambesi is the Kabompo, which rises in the northwest of Rhodesia, about lat. $11^{\circ} 34'$ S., and lon. $25^{\circ} 17'$ E., also at an altitude of 5,000 feet, and in a region of open grassy downs. The former stream, at first known as Yambeshe and then as Liambai (Liambeshe), flows at first west with a southward trend, and then turns south-southeast. Ten miles of rapids precede the Sapuma cataracts ($13^{\circ} 7'$ S.), where the river flows "through a narrow rocky fissure into a pool of considerable extent." At about 14° S. it is joined by the Kabompo from the northeast and the remaining course of the Upper Zambesi has a south and southeasterly direction through the low-lying, grassy Marotse country, and is marked by various cataracts and rapids. Sesheki is a place of some importance on the left bank, near where the river begins to be wholly in British territory; and a short distance farther down, opposite Kazungula, it receives from the west the waters of the large tributary Kuanda. In about 18° S. there are the celebrated Victoria Falls (q.v.), discovered by Livingstone in 1855. Here the broad river suddenly plunges into a transverse chasm 400 feet deep amidst a scene of tremendous grandeur. The gorge just below and in full view of the falls is spanned since 1904 by a lofty bridge on the Cape to Cairo Railway. The Middle Zambesi, whose direction is east, northeast, and again east, receives the Guay-Shangani and San'yati from the south; the Kafukwe and Loangwa from the north, the latter at Zumbo, where the river leaves British territory; and is interrupted by various rapids and rocks, especially at low-water, the Kebrabasa Rapids being the first impassable obstacle to navigation from the mouth. The remaining course of the river (Lower Zambesi) has been described as, except for the Lupata Gorge, "merely a broad expanse of sand, three to five miles wide, with low, reed-fringed banks, and intersected by numerous shallow streams." It passes the town of Tete, below which it is joined on the right

by the Mazoe, and after passing Sena it receives from the left the Shiré from Lake Nyassa, the waterway to British Central Africa. It enters the Indian Ocean by several mouths, of which the Chinde one is the most practicable. The delta covers an area of about 25,000 square miles, and commences about 90 miles from the coast, a little below the confluence of the main stream with the Shiré. The river drains an area estimated at 600,000 square miles. Its basin is separated from that of the Orange River on the southwest by a slight watershed, and from that of the Limpopo on the south by a mountain range. The valley of the Zambesi is capable of immense development in the way of trade. The Portuguese government has long exercised sway for 300 miles from the mouths of the river, and by the international arrangement of June 1891 the river from the coast to the confluence of the Loangwa is recognized as being in Portuguese territory. The Zambesi and its affluents are now free to the flags of all nations. The Upper Zambesi was first explored by Livingstone, who reached the Liambai in 1851.

Zambesia, zām-bě'zhī-ā, one of the three districts of Portuguese East Africa, and a name popularly applied to the regions in Rhodesia divided by the Zambesi, and known respectively as North and South Zambesia. See EAST AFRICA, PORTUGUESE; RHODESIA.

Zamboanga, thām-bō-an'gā, Philippines, (1) town, capital of the comandancia of Zamboanga; on the southern coast, 17 miles across the strait from Isabela. It was founded in 1635 as a base of operations against Moro pirates; shortly before the American occupancy of the islands it was almost entirely destroyed by fire, partly by the Spaniards and partly by the Filipinos; since then it has been rebuilt. Many of the houses are of stone, and the town contains a fort, the Castle of San Felipe, a cathedral, and a public hospital. It is connected with Manila by steamer, and is the chief market in the southern part of the archipelago for hemp, copra, and gutta percha. (2) Comandancia of Mindanao, forming the western peninsula of that island; bounded on the north by Dapitan, on the south by the Celebes Sea and Basilan Strait, on the east by Cotabato, and on the west by the Sulu Sea; length from northeast to southwest 103 miles, and from east to west along the northern boundary 94 miles; area, 3,358 square miles; with dependent islands, 3,486 square miles. The main mountain range extends west and then southwest from the northeastern boundary; another range traverses the Bañaninan or Flecha peninsula. The climate is the best in the Philippines, the temperature varying but a few degrees. Agriculture and stock raising are the more important industries; rice, hemp, cotton, coffee, sugar, coconuts are cultivated; and cloves and nutmegs and vegetables are also among the valuable products of this province. Cattle, horses, and hogs are raised. There is an abundance of valuable woods, particularly teak and juniper; several saw mills, coconut mills, and small sugar mills are in operation, but the mechanical industries are almost entirely for supplying home demand. There are indications of coal and gold, but no mining. There are no roads except near the towns. Pop. (1903) 20,692.

Zambo'ni's Pile, in electricity, a dry voltaic pile or battery invented by Zamboni. Paper silvered on one side is damped and coated on the other with manganese dioxide; half a dozen of these sheets being superposed to save time, disks are punched out, and 1,000 to 2,000 single sheets are compressed in a glass tube with metal caps and knobs at the ends. Such a pile will charge a Leyden jar, though it will not give shocks or sparks.

Zam'ia, a genus of *Cycadaceæ*. (See CYCADS.) In aspect the species partly resemble palms, and partly tree ferns; in affinity they are nearer the latter than the former, but rise considerably above them in organization. They are natives of tropical America, tropical Asia, the Cape of Good Hope, and Australia. *Z. caffra* is the bread-tree *Zamia*. It is six or seven feet high, and is a native of southeastern Africa, where the Kaffirs and the Hottentots make cakes of the pith after it has putrefied. *Z. spiralis* has many smooth leaflets, with a few spines at the tip. It grows in Australia, where the natives eat the fruit. The stems of *Z. tenuis* and *Z. furfuracea*, and the seeds of *Z. integrifolia* or *pumila*, in the West Indies, yield arrow-root. The Florida Indians call the last "coontie," and manufacture flour from the rhizomes. It grows in the everglades of Florida, and has large tubers of the shape and size of parsnips, which are rough and gray on the outside, but are white internally. The tubers are pounded to a pulp, in a log mortar, and washed in a straining cloth, the abundant starch of the coontie passing through and settling in a deerhide. This process rids the plant of an acrid poisonous principle which is carried away by the water. The Federal armies lost a number of men during the Civil War, who ate the root in its crude poisonous state. The sediment, or starch left in the deerskin after straining, is fermented and dried, and becomes a yellowish-white flour ready for use, which has long been a staple food of the Seminoles. The coontie starch, when extracted in proper mills, is finer and whiter than the Indian product, and is called Florida arrow-root. It is nutritious, and makes excellent puddings, and the like.

Zamojski, ză-mo'jskē, an ancient family of Poland, whose most distinguished members have been JAN ZAMOJSKI, statesman and general (b. Skokow, palatinate of Chelm, 1 April 1541; d. near Skokow 3 July 1605). He was educated at Paris, Strasburg, and Padua, and in 1564 was elected rector of the university at Padua. In 1565 he returned to Poland, and upon the death of King Sigismund Augustus in 1572, succeeded in so organizing the equestrian order, that in the diet of 1573, held at Warsaw, Henry of Anjou (afterward Henry III of France) was chosen king of Poland. Upon the abandonment of Poland by Henry, a party of nobles elected Maximilian II. of Austria, and he was proclaimed king by the primate; but the party hostile to the house of Austria chose Stephen Báthori (q.v.), who marched rapidly to Cracow, and was there crowned. Zamojski, the leader of this movement, was made grand chancellor of the kingdom. In 1580, during the war with Russia, Báthori appointed him commander of the principal army, with the title of hetman; and in 1582 he negotiated the peace by which Livonia, Esthonia, and Novgorod were

ceded to Poland. After the death of Báthori in 1586, he might have secured the crown for himself; but he used his influence in favor of Sigismund III., son of the king of Sweden, defeated the army of the opposing claimant, the Archduke Maximilian, at Cracow, pursued him into Silesia, and took him and his forces prisoners. From 1590 to 1597 he was engaged in a constant series of wars; and while Sigismund, with whom he was no favorite, did not concern himself about the condition of the kingdom, he almost alone maintained the integrity of the state, fighting successfully against the Turks, Tartars, and Cossacks, and oftentimes supporting the army from his private fortune. Zamojski was not only a great statesman and general, but a munificent patron of literature and the sciences. He founded New Zamosc, which came to be regarded as one of the strongest fortresses of Poland, and established there an academy and a famous printing press. He wrote 'Testamentum Joannis Zamori' (1606), and many letters of his are to be found in Lumg's 'Literæ Procerum Europæ.' JAN ZAMOJSKI, general, grandson of the preceding (b. 1620; d. Warsaw 2 April 1665). He participated in the campaign of 1651 against the Cossacks, was made palatine of Sandomir, and was very conspicuous in the following wars. In 1659 he was at the head of the army which acted in the Ukraine against the czar of Russia. ANDRZEJ ZAMOJSKI, statesman (b. Biegun 1716; d. Zamosc 10 Feb. 1792). He entered the military service of Saxony, went back to Poland in 1754 and was made marshal of the palatinate of Smolensk. In 1760 he emancipated his serfs, and on the accession of Stanislas Augustus was appointed grand chancellor. In 1776, at the request of the diet, he drew up a code of laws, which was printed under the title of "Zbiór praw sądowych" (1778). The liberal character of the code, especially its provision for a general measure of emancipation, aroused against it so great a hostility, that in the diet of 1780 it was not permitted to be read, but it was adopted in 1791. ANDRZEJ ZAMOJSKI, statesman, grandson of the preceding (b. 2 April 1800; d. Cracow 20 Oct. 1871). He studied at Geneva and Edinburgh, entered the Polish civil service in 1823 and was minister of the interior of the revolutionary government in 1831. He later introduced steam navigation on the Vistula, but as the head of an important agricultural association incurred the suspicion of the Russian government. The association was suppressed in 1862 and Zamojski banished.

Zamora, thi-mō'ri. **Antonio de**, Spanish dramatist: b. Madrid about 1600; d. there before 1744. He was a court officer during the reign of Philip V. and also held a secretaryship in the department of Indian affairs. He wrote a number of dramas which were highly esteemed by his contemporaries. He imitated the style of Calderon, but rarely attained the poetic beauty of that author; the best of his dramas, however, show skillful development of character. Among the most noteworthy are 'Mazariegos y Monsalves'; 'Cada uno es Linaje Aparte'; 'El hechizado por fuerza,' a comedy produced in Spain in modern times; and 'El Convidado de Piedra,' on which is based the libretto of the opera of 'Don Juan.'

ZAMORA — ZANESVILLE

Zamora y Coronado, ē kō-rō-ná'fhō, **Jose Maria**, Central American jurist: b. Cartago, Costa Rica, 1785; d. Cuba after 1846. He was educated in Spain and on his return from there held important judicial and civil posts in both Porto Rico and Cuba. He published 'Registro de la legislacion ultramarina' (6 vols. 1844-8), a work of much historical value on account of its being a collection of laws and regulations pertaining to the Spanish-American colonies.

Zamora, Spain, a city in Leon, capital of a province of the same name, 140 miles northwest of Madrid, on a rocky hill on the right bank of the Douro, here crossed by a fine bridge. It has interesting mediæval buildings, and is the see of a bishop; the cathedral is a Gothic structure, completed about 1174, but partially modernized in the Corinthian and Doric styles. Zamora as a fortified town played an important part in early Spanish history, and is renowned for the successful defense which it made against the Moors in 939 A.D. Pop. (1900) 16,417.

Zamora, Venezuela, an interior northwestern state bounded by Lara, Miranda, Bolivar, and Los Andes. The capital is Guanare (q.v.). Area, 25,212 square miles. Pop. 240,676.

Zamosc, za'mōsch, Russian Poland, a fortified town in the province of Lublin, on the Wieprz, 50 miles southeast of the town of Lublin. It was laid out in 1588 in the Italian style by Jan Zamojski, and all its houses have arcades. Its fine castle, the four churches, the arsenal, and the town-house are the chief buildings. The manufacture of furniture is the principal industry. Pop. (1897) 12,400.

Zamouse, ză-moos', the West African buffalo (q.v.).

Zampa, zan-pa, **Ou la Fiancée de Marbre**, an opera comique by the French composer, Louis Joseph Ferdinand Herold (q.v.), first produced in 1831.

Zampieri, dzam-pē-ā'rē, **Domenico**. See DOMENICHINO.

Zanardelli, Giuseppe, joo-sēp'pē dza-nar-dēll'ē, Italian statesman: b. Brescia 29 Oct. 1826. After study at Pavia, he was a volunteer in the war of 1848, then was for a time in journalism and gave lectures on law, but was forced by the Austrian officials to discontinue them. Elected deputy in 1850, he held various administrative posts, in 1876 became minister of public works, and in 1878 of the interior. From 1881 to 1883 he was minister of justice, and from 1887 to 1891 again held that portfolio. During the latter period of service he issued the penal code and commenced a reform in the magistracy. He was president of the Chamber of Deputies in 1862-4, in 1867 was again chosen, in December 1897 accepted the portfolio of justice for a third time, but withdrew in May 1898, once more to become president of the Chamber. This post, too, he relinquished, to identify himself with the opposition, and at the fall of the Saracco cabinet in February 1901 was able to form an administration with the aid of the extreme left. He was an orator of high rank, a steadfast Liberal, and the recognized leader of the constitutional left.

Zandeh, zān'dā. See NYAM-NYAM.

Zane, zān, **Ebenezer**, American pioneer: b. Berkeley County, Va., 7 Oct. 1747; d. Wheeling, W. Va., 1811. Of Danish descent he made the first permanent settlement on the Ohio River in 1770, on the site of the present city of Wheeling, building there a block house called Fort Henry, whence he repelled several Indian assaults during the Revolutionary War. He was a disbursing officer under Lord Dunmore; held several military and civil offices, and attained the rank of colonel. The land where the city of Zanesville, Ohio, now stands, formed a portion of his property, and he assisted John McIntire in laying out that town in 1799. The locality was called by them Westbourn, and the present name was not adopted till 1802.

Zanella, Giacomo, ja'kō-mō dzā-nēll'ā, Italian poet. b. Chiampo (Vicenza) 1820; d. Vicenza 17 May 1888. After studying for the priesthood at the Vicenza seminary, he became professor there of philosophy and Italian literature. Having held posts in lycæums at Venice, Vicenza, and Padua, he was made professor of Italian literature in the University of Padua in 1860, and in 1871-2 was rector of the university. His work is noted for beauty of style and mastery of form; his most popular poem being 'La Conchiglia Fossile' (The Fossil Shell). His first volume of poems, 'Verses,' appeared in 1868, and was followed by several others. Among his poetic tales are: 'The Little Calabrese' (1870), and 'Robin Redbreast' (1881). He published also some volumes of prose, including 'On Italian Literature in the Last Century' (1885).

Zanesville, Ohio, city, county-seat of Muskingum County, on the Muskingum River at the confluence of the Licking, and on the Baltimore & O., the Cincinnati & M. V., the Ohio & L. K. branch of the Baltimore & O., the Ohio River & W., the Wheeling & L. E., the Zanesville & W., and the Zanesville, M. & P. R.R.'s, and on the Columbus, Newark & Zanesville Interurban Electric Railroad. The town was originally founded by Jonathan Zane and John McIntire in 1799. The city is situated in the midst of a fertile agricultural region, and near the city are extensive deposits of coal, clay, and limestone.

Principal Buildings, etc.—The chief buildings include the New Masonic Temple, the People's Saving Bank building, Soldiers and Sailors' Monumental building, Schultz Opera House, Weller Opera House, County Court-house, Schultz office building, Zanesville High School, Clarendon Hotel building, and City Market House.

Manufactures.—Manufacturing began early in Zanesville, and was rapidly increased owing to the excellent water-power furnished by the Muskingum River, and the low price of fuel. The manufactures are varied and consist of the largest tile works in the world, potteries, agricultural implements, bent wood works, breweries, brick-yards, coffin factories, foundries, flouring mills, glass houses, leather tanneries, machine-shops, mining tool factory, tube works, and woolen mills, etc. The employment list numbers nearly 6,000 persons.

Banks, Churches, Schools, etc.—The city has four national banks, with a capital of \$650,000; there are also two state banks and seven savings banks; there are 31 churches, in-

cluding nearly all the leading denominations. There are 44 secret societies. The city has a very complete school system, there being 17 public schools, the Zanesville Business College, two Roman Catholic parochial schools, besides a high school, a Roman Catholic academy, and a Lutheran parochial school. The McIntire Children's Home was endowed by the estate of John McIntire.

Government, etc.—The organization of the city under the Ohio Code consists of a mayor, three members of the board of public service, who also constitute the board of health; two members of the board of public safety, appointed by the mayor; joint city and county board of workhouse directors, appointed by the mayor; and a police judge. The city has a municipal water plant and a municipal hospital. Pop. (1904) 24,574.

FLORENCE C. HYSER,
Secretary Post-Office Executive Department,
Zanesville.

Zang'will, Israel, British author; b. London 1804. He was educated at the Jews' Free School (Spitalfields) and the University of London, published in 1888 'The Premier and the Painter,' a fantastic romance, in 1890 established 'Ariel, or the London Puck,' a brilliant but short-lived periodical, and soon made his reputation by his essays, works in fiction, and plays. His department of literary causerie, 'Without Prejudice,' in the 'Pall Mall Magazine,' became well known in Great Britain for its able critiques. Some of these essays were gathered into a volume of that title in 1896. Some of Zangwill's best fiction deals with Jewish types and subjects, as in 'Dreamers of the Ghetto' (1898), with its semi-historical pictures of Heine, Spinoza, Uriel (Gabriel) Acosta, and others. He lectured in Great Britain, Ireland, Palestine, Holland, and the United States, and, as a prominent Zionist, gave addresses in connection with that movement and the application to it of the Baron de Hirsch millions. His literary work is in a style of much distinction, with frequent touches of irony. Among his farther volumes are: 'Children of the Ghetto' (1892); 'Ghetto Tragedies' (1893); 'They That Walk in Darkness' (1899); 'The Mantle of Elijah' (1900); 'The Grey Wig' (1903); and 'Blind Children' (1903), a collection of his verses. The play which he constructed (under the same title) from his 'Merely Mary Ann' (1893), was more successful (1904) than the dramatization (1890) of 'Children of the Ghetto' or the one-act 'The Moment of Death' (1900). 'Six Persons' (1892) was well received in England.

Zangwill, Louis, English author, brother of I. Zangwill (q.v.); b. Bristol 25 July 1869. At first a journalist he later took up literature as a profession, using for a while the pseudonym "Z.Z." He has published 'A Drama in Dutch' (1894); 'The World and a Man' (1896); 'The Beautiful Miss Brooke' (1897); 'A 19th Century Miracle' (1897); 'One's Womanhood' (1902); etc.

Zankoff, zan'köf, Dragan, Bulgarian politician; b. Sistova 1827. He studied at the universities of Odessa, Kiev, and Vienna, and entering the service of Turkey, became secretary to the Pasha of Rustchuk, Bulgaria. In 1880 he was made premier of Bulgaria and minister

of foreign affairs by Prince Alexander, and again held the post of premier 1883-4. Later he became the enemy of Alexander and the head of the pro-Russian party. On the night of 20 Aug. 1886 Zankoff with a party of fellow-revolutionists broke into Prince Alexander's palace and forced him to resign. Zankoff then became a member of the provisional government.

Zanotti, dzā-nōt'tē, or Cavazzoni Zanotti, Giovanni Pietro, jō-van'nē pē-ā'rō, Italian artist; b. Paris 1674; d. Cortona 1765. He was a pupil of Lorenzo Pasinelli at Bologna, and became a good designer and colorist, and an adept in chiaroscuro. For churches at Bologna he executed several altar-pieces, among the chief that of 'The Incredulity of St. Thomas' in the church of that saint. There is also in the Palazzo Pubblico a large picture by him of 'The Ambassadors of Rome Swearing Fidelity to the Bolognese.' At Cortona, where he long resided, he distinguished himself by such pictures for churches as 'Christ Appearing to Mary Magdalene' and 'Christ Carrying His Cross.' He was a careful writer on art, the most important of his works being the 'Storia dell' Accademia Clementina di Bologna' (1739).

Zante, zān'tē, or Zacynthus, Greece, one of the Ionian Islands, in the Mediterranean, between eight and ten miles south of Cephalonia, and 15 miles from the nearest point of Greece. It is about 24 miles long, 12 miles broad, and 60 miles in circuit; area, 277 square miles. It has the form of an irregular oblong, indented with a deep bay at its southeast extremity. The western half is hilly, rising to 2,500 feet, and the west coast exhibits limestone cliffs. The east coast has a harbor, within which is situated the town of Zante [pop. (1896) 14,906] a thriving and well-built place, the see of a Greek protopapas, and of a Roman Catholic bishop. Part of the island consists of an extensive fertile plain, having the appearance of one continued vineyard, with a few patches under cereals or pasture. The prevailing rocks are calcareous; gypsum appears in various parts, and its pitch-vells are famous. Earthquakes frequently occur. The staple export of Zante is currants. The other chief exports are oil, soap, and a little wine; pomegranates, melons, peaches, oranges, citrons, and other fruits are grown, but the corn raised scarcely supplies three months' consumption. Goats are the only live stock. The island forms a nomarchy of the kingdom of Greece, since 1864; it is mentioned by Homer, and was formerly an independent state which successively came under Macedonian, Roman, and finally Greek rule. Pop. (1896) 45,032.

Zanza'lians. See JACOBITES.

Zanzibar, zan-zī-har', East Africa, (1) A former sultanate comprising the whole coast between Magdishu (Magadoxo), about lat. 2° N., and Cape Delgado, lat. 10° 42' S., with the four islands of Zanzibar, Pemba, Lamu, and Mafia. The continental part of the sultanate in 1890 was divided between British East Africa and German East Africa; while the island and town of Zanzibar, and the island of Pemba became a British protectorate; joint area 1,020 square miles; pop. est. 250,000. (2) The island of Zanzibar with an area of 600 square miles, is very fertile and well cultivated, being espe-

cially suited for the cultivation of cloves, sugar, coffee, cocoa, and various spices, of which there is a considerable export. The heterogeneous population estimated at 200,000 includes Europeans, Arabs, half-caste Portuguese from the Malabar coast of India, and the Suahilis from the mainland. (3) Zanzibar, the chief town (pop. 100,000) on the west side of the island, is the centre of trade for the eastern seaboard of Africa, and of missionary and exploring work for the interior.

Zapolya, zä'pöl'yö, **John**, king of Hungary: b. about 1487; d. 1540. After the death of Louis II. at Mohács (1526) he was elected king of Hungary by the National party, having previously been voivode, or prince, of Transylvania. The crown was contested by Ferdinand of Austria, who was at first so successful as to compel Zapolya to flee to Poland. But the latter, with Turkish assistance, by 1529 had subdued a great part of Hungary, together with the capital city of Buda, as well as Transylvania. The kingdom was divided between Zapolya and Ferdinand in 1538 by the treaty of Grosswardein.

Zappi, Giovanni Batista Felice, jö-vän'në ba-tës'ta fä-lë'chä zap'pë, Italian poet: b. Imola 18 March 1667; d. Rome 30 Aug. 1719. After a legal training at Bologna, he went to Rome, where he gained a brilliant reputation as juriconsult and poet. He assisted in establishing the Academy of Arcadians, in which he held the name Tirsi Leucasio. His verse abounds in fantastic adornments. A collection of it appeared in 1776, and it has been otherwise published, both separately and in association with that of his Arcadian colleagues. He received the patronage of Pope Clement XI.

Zara, zä'ra, Ital. dzä'ra, Austria, a seaport town, capital of Dalmatia, on a promontory, which was converted into an island by cutting through the narrow isthmus which formerly connected it with the mainland, 70 miles northwest of Spalatro. It was a fortress till 1873, and still has four gates and medieval ramparts, the latter now converted into a public promenade. It has steep and narrow streets; several squares; an ancient and interesting cathedral, in the Lombard style; several other churches; a town-house; a lyceum, gymnasium, archiepiscopal seminary, normal and other schools; a civil and a military hospital; and a capacious but somewhat shallow harbor, admitting warships of medium size. It has manufactures of rosoglio, maraschino, and glass, and some trade. Zara has stood many sieges, particularly one in 1202, when it was taken by the Venetian doge Dandolo, with the assistance of the French crusaders; and another in 1346, when it was taken by Marino Faliero in the face of a large Hungarian army. Pop. (1900) 32,500.

Zarate, thär-ä'tä, **Antonio Gil y**, Spanish dramatic poet: b. San Lorenzo de l'Escorial, Spain, 1705; d. 1800. He was educated in Paris; and on his return to Spain became professor of physics in Granada. He afterward wrote dramas notable for striking situations, lively dialogue, and elegant versification; among them are: 'Blanche of Bourbon' (1835); 'Guzman the Brave'; 'The Czar Demetrius'. He also published a history of Spanish literature.

Zarate, Augustin de, Spanish historian: b. about 1492; d. Madrid about 1560. After holding for 15 years the office of comptroller of Castile he accompanied Nunez Vela, viceroy of Peru, to South America in 1543, and while there was not only an eye witness of many historical events of importance, but made a close study of Peru and its annals. On the fall of Gonzalo Pizarro he returned to Spain and in 1555 published 'Historia del descubrimiento y conquista de la provincia del Peru' (History of the Discovery and Conquest of the Province of Peru). There have been many later editions of this most valuable work, and it has been translated into French and Italian.

Zarathushtra, zä-rä-thoosh'tra. See ZOROASTER.

Zar'atite, an emerald-green incrustation usually on chromite. It is a hydrous basic carbonate of nickel. Its best known locality is at Texas, Pennsylvania. It is often called "emerald nickel."

Zaree'ba. See ZERIBA.

Zarit'zin, Russia. See TSARITSYN.

Zarlino, Giuseppe, joo-sëp'pë dzär-lë'nö, Italian composer: b. Chioggia, near Venice, 1520; d. Venice 14 Feb. 1590. He became a Franciscan in 1537 and in 1541 went to Venice to study music with Willaert. In 1565 he was appointed choir master of Saint Mark's, Venice, and continued in that position till his death. He was especially famous for the music he composed to be performed on the occasion of the victory of Lepanto. He determined the relations of the tones and semi-tones more precisely than had previously been done, and on this subject wrote 'Istituzioni armoniche' (1562-73). Other works of his are: 'Dimostrazioni harmoniche' (1571); 'Supplementi musicali' (1588). Among his musical compositions may be named 'Modulationes' (1566); 'Lectiones pro Mortuis' (1563).

Zarncke, tsärn'kë, **Friedrich**, German scholar: b. Zahrenstorf, near Brühl, Mecklenburg-Schwerin, 7 July 1825; d. Leipzig 15 Oct. 1891. After study at Rostock, Leipzig, and Berlin, he founded the 'Literarisches Zentralblatt für Deutschland' at Leipzig in 1850, and in 1858 became professor at the university there. His work in connection with mediæval literature was of particular importance, and his chief publications were his edition of Brant's 'Narrenschiff' (1854), and joint-edition of Benecke's 'Middle High German Lexicon' (1863). His valuable library was acquired by Cornell University. Among his further writings were a study of Christian Reuter (1884) and 'Kurzgefasstes Verzeichniss der Originalaufnahmen von Goethes Bildniss' (1888).

Zarskoje-Selo, zär-skö'i-sä'lö, Russia. See TSARSKO-SELO.

Zauberflöte, tsow'bër-flë'të, **Die** ('The Magic Flute'), an opera by Mozart, first produced at Vienna in September 1791, under the direction of the composer. A French version of the opera bears the title 'Les Mystères d'Isis.'

Zavala, thä-vä'lä, **Joaquin**, Nicaraguan politician: b. Nicaragua about 1830. He entered the army, became prominent in political affairs and was president of Nicaragua 1879-83.

He was afterward minister to the United States and in 1893 headed the insurrection which secured the deposition of President Sacaza in May 1893. On 17 July of that year he was declared provisional president, but only to lose his position through another revolt a fortnight later.

Zbylitowski, zbl̩-li-tow'skē, **Andre**, Polish writer, philosopher and poet: b. Galicia 1732; d. 1813. He was doctor of philosophy for a time at Cracow and later made extensive travels through South America and Europe. He has published 'Rhythms in Polish Verse' (1763); 'The Marshal'; 'A Beard'; etc.

Zbylitowski, **Pierre**, Polish writer and poet: b. in the palatine of Lublin 1684; d. Warsaw 1757. He was educated at the University of Warsaw and after leaving there traveled extensively through Europe and North America. He has published 'Porydia' (1734); 'Epigrams' (1735); 'Lucie,' a poem (1739); etc.

Zea, thā'a, **Francisco Antonio**, Colombian naturalist and statesman: b. Medellin, New Granada (Colombia), 21 Oct. 1772; d. Bath, England, 28 Nov. 1822. After study at the College of Popayan, he was connected with the botanical expeditions of Mutis, in 1795 was sent to Spain under arrest on the charge of circulating republican literature, and though acquitted in 1799 was forbidden to return to New Granada. He carried on botanical researches in Europe, but in 1815 joined Bolivar at Jamaica. In 1819 he was chosen vice-president of Colombia by the congress of Angostura, and in 1820 went to Europe as envoy of the Colombian republic to France and England. He has sometimes been styled the "Franklin of Colombia." Among his published works are: 'Memoria sobre la Quina según los Principios de Mutis' (1800), and a 'Historia de Colombia' (1821).

Zea, zē'a. See CEOS.

Zealand, zē'land, or **Sjælland**, Denmark, the largest island of the kingdom, between the Cattegat and the Baltic, separated from Sweden by the Sound and from Funen by the Great Belt; area, with the two southern islands of Moen and Samsøe, 2,793 square miles; pop. 833,702. It has no mountains; but the surface is finely variegated, having small hills and fields of a fertile soil, intersected by canals. It produces large crops of corn, and has excellent pasture. Besides several other towns of considerable importance, it contains the fortress of Elsinore or Helsingør, and the capital and royal residence, Copenhagen.

Zealand, or **Zeeland**, Netherlands, a province bounded south by Belgium, and west by the North Sea; area, 690 square miles. Capital, Middelburg, in the island of Walcheren; principal seaport town, Flushing. The province consists of a low-lying tract of land on the frontiers of Belgium and on the southern shore of the estuary of the Schelde, and of the islands of Walcheren, North and South Beveland, Schouwen, Tholen, etc., separated from each other and from the mainland by arms of the Schelde, from which and from the North Sea it is protected by dikes. As a whole the province is flat and fertile, producing excellent crops of the ordinary cereals, a considerable quantity of clover, rape, and madder, and a superabundance of excellent fruit. The grass

lands also are rich and extensive. The climate is rather moist, but comparatively healthful. Large tracts partially covered by the sea have in recent times been successfully reclaimed. Pop. (1901) 219,832.

Zeal'ots, a sect of the Jews, composed of the more fanatical elements opposed to Roman rule. They led a revolt against the Romans in 6 A.D., and after that frequently robbed and murdered those whom they knew to be supporters of or sympathizers with the Romans. Felix tried to suppress them by crucifying all of the sect whom he could capture, but this only caused an increase in the number of their acts of violence. They continually stirred up the Jews against the Romans, and were largely influential in bringing on the Jewish war of 66-70, which resulted in the overthrow of Jerusalem.

Zeballos, thā-bal'yōs, or **Ceballos**, **Pedro** (ZEBALLOS CORTES Y CALDERON), Spanish general: b. Cadiz 29 June 1715; d. Cordova 26 Dec. 1778. Entering the army as a cavalry captain in 1738, he became a lieutenant-general in 1755 and was despatched to Buenos Ayres as governor the next year. On the outbreak of the war with Portugal and England in 1762, Zeballos besieged the Portuguese port of Colonia de Sacramento, near the entrance of the Uruguay River, forcing its surrender 2 Nov. 1762, and capturing 26 English ships in its harbor. He returned to Spain in 1767 and in 1777 was made viceroy of the newly established viceroyalty of La Plata. On his way thither he wrested Santa Catharina from the Portuguese and retaking Colonia de Sacramento, which had reverted to Portugal since its former capture, destroyed it. He was relieved of his duties in 1778 and returned to Spain.

Zebid, zē-bēd', Arabia, a town in Yemen, on the inland route from Hodeida to Mokha, 60 miles north of the latter. It was formerly the seat of a long line of princes, and was famous for its commerce and learning. The population has dwindled to 7,000 inhabitants.

Ze'bra, the name of several animals, natives of Africa, belonging to the family of the horses. The zebra belongs to the same general type as the ass, distinguished from *Equus* (the horse) proper by smaller size and by having the body more or less banded black upon yellowish. The forelegs only possess the "warts," seen in both fore- and hind-limbs in the horses; and the tail is "tufted." The typical or mountain zebra (*Equus zebra*) inhabits South Africa, but it is now almost extinct. A few specimens, however, are strictly preserved in the mountainous districts of eastern Cape Colony, where, until about 1875, they abounded in herds on the plains. The body is cream-colored, its characteristic bands being deep black. The stripes are drawn at right angles to the axis of the body. The legs are striped right down to the hoof, but the under part of the body has no stripes. The neck bears a faint development of skin or dew-lap, and the mane is very short. The animal was long considered untamable, but experiments made since 1872 have shown that with proper treatment it can be made to work well in harness. Any general utilization and improvement of it, however, seems impracticable. The dauw, or Burchell's zebra (*Equus burchelli*), is higher and more graceful than the true zebra,

ZEBRA PARRAKEET — ZECHARIAH

and is the one commonly seen in menageries. Its stripes are narrower and somewhat differently disposed from those of the true zebra, and extend under the belly, but are absent from the lower part of the legs. It has been driven northward, and is now rare even in the Transvaal. Chapman's zebra (*E. chapmani*) is another variety, found from Bechuanaland north to the Sudan. Grévy's zebra (*E. grévyi*) is restricted to Abyssinia and Somaliland. The quagga (q.v.) is a near ally of the zebras. Consult Lydekker, 'Royal Natural History,' Vol. II. (London 1895); Tegetmeier and Sutherland, 'Horses, Zebras, Mules and Mule-breeding' (London 1895).

Zebra Parrakeet. See BUDGERIGAR; PARRAKEET.

Zebra-shark. See TIGER-SHARK

Zebra Wolf, an early colonial name for the wolf-like, striped, predatory marsupial of Tasmania. See DASYURE

Zebra Wood, in botany and commerce: (1) A kind of wood, imported from South America, and used by cabinet makers, produced by *Connarus guianensis* (*Omphalobium lambei*), a large tree belonging to the natural order *Connaraceae*, and growing in Guiana. Its colors consist of brown on a white ground, clouded with black, and each strongly contrasted, thus somewhat resembling the skin of a zebra. It is also called pigeon wood, and is used for furniture. (2) The wood of *Eugenia fragrans*, variety *cuneata*. It is a shrub about eight feet high, growing in Jamaica. (3) The wood of *Guetlardia speciosa*, an evergreen tree 25 feet high, with scarlet-colored flowers, growing in the East Indies.

Zebú, zē-boō' or thā-boō', Philippines. See CEBU.

Zebu. See INDIAN HUMPED CATTLE.

Zebulun, zēb'ū-lūn, or **Zebulon**, the tenth of Jacob's 12 sons, and the sixth and last by his wife Leah (Gen. xxx 19-20). Of his individual history nothing is related in the Scriptures, but his name was given to one of the 12 tribes of Israel, and to a region of Palestine. At the time of the exodus from Egypt the tribe of Zebulun moved in the van, following the tribes of Judah and Issachar. The territory of the tribe lay in the fertile hilly country to the north of the plain of Jezreel, and included Nazareth. The tribe of Zebulun was inferior in importance to several of the other tribes and its tribal existence closed when Tiglath-Pileser carried its principal members, with the northern tribes, into captivity (II. Kings xv. 29).

Zech, **Frederick**, American pianist and composer: b. Philadelphia, Pa., 10 May 1858. Taken to San Francisco when very young, he began to study music there and afterward studied in Berlin, 1877-82. Since the year last named he has resided in San Francisco, where he has been conductor of the symphony orchestra and has given many piano recitals. Among his many compositions are four symphonies, four concertos for piano and orchestra, two symphonic poems, 'The Eve of Saint Agnes,' and 'The Raven'; an opera, 'The Cruise of the Excelsior'; sonatas and songs.

Zechariah, zēk-a-ri'ā, the eleventh in order of the Hebrew writers known as minor proph-

ets. Little is known of his personal history, but he first publicly discharged his office as priest in the second year of Darius 519 B.C. He is called in his prophecy the son of Berechiah and the grandson of Iddo, but in the Book of Ezra he is termed "the son of Iddo." He was priest as well as prophet and is associated with the prophet Haggai. Tradition states that Zechariah had much to do in furnishing the liturgical services of the temple, and in the Septuagint and Vulgate versions several psalms are attributed to him. He deals in his prophecy with the same objects as occupied the mind of the prophet Haggai. His style is characterized by symbolic vision and dramatic action. It is distinctly Apocalyptic. This form of prophecy never predominated until after the Exile and seems to have constituted an element in the last and most powerful appeal made by the mouthpieces of Jehovah to the heart and conscience of His people.

Contents of the Prophecy.—The greater portion of the Book consists of a series of visions intended to represent grounds for national confidence and to encourage national effort. The prophecy opens with an exhortation to repentance and a warning against neglect of the prophet's word. The remainder of the book consists of two sections. The first section runs from Chapters i. to vi.

Ch. i 15 contains nine symbols, mostly visions, accompanied by their interpretations:

Ch. i. 8-17, a vision of the horses of Jehovah, which, as His messengers, report to Him; along with His reply.

Ch. i. 18-21, four horns, representing the opponents of Israel, are broken.

Ch. ii., a man with a measuring-line lays out the restored Jerusalem.

Ch. iii., Joshua, the high priest, is accused by Satan, and acquitted, and is honored with commissions and revelations from Jehovah.

Ch. iv., the beautiful symbol of the golden candlestick and two olive trees, with the practical application of encouragement to Zerubbabel.

Ch. v. 1-4, a flying roll recording a curse upon immoral actions.

Ch. v. 5-11, an ephah measure containing a woman is seen carried away to Babylon.

Ch. vi. 1-8, four chariots, each having horses of a particular color, are the four heavenly spirits charged to carry out God's purposes in the earth.

Ch. vi. 9-15, the symbolical action of crowns of silver and gold being made and placed upon the head of Joshua the high-priest, who thus represents the Messiah-priest upon His throne.

The second section runs from chapters vii. to xiv. In ch. vii the prophet, in answer to a question as to observance of a certain fast, replies that the true fast is justice, mercy and piety, which had been so much neglected in earlier generations. This suggests, in ch. viii., the coming Messianic time, when the city shall be populous and happy under the renewed protection of Jehovah, and the fasts shall be joyful feasts, attended by multitude of strangers seeking His favor.

There is so much that is matter of dispute in ch. ix-xiv., as regards their date and immediate application, that we shall have to content ourselves with a summary and a few general re-

marks. The contents are largely symbolical and figurative. Ch. ix.-xi. form a division by themselves, perhaps written by the Zechariah of Isa. viii. 2. It has an entirely different historical setting from that of ch. i., 8. Here we are transported back to the 8th century B.C. Ch. ix. 1-8 refers to conquests made by Tiglath-pileser III. (745-727 B.C.). Northern Israel is still in existence, and Assyria is still in its "pride" (x. 10ff.). These allusions form part of the very texture of the prophecy, and are assumed by some to be old fragments embedded in a post-Exilic work.

Ch. ix. 1-8, Syria, Phœnicia, and Philistia are to be brought low. Yet a remnant of the Philistines shall be united with Judah, and both shall be under the protection of Jehovah. Ch. ix. 9-17, the Messiah shall come as the Prince of Peace to restore the dispersed of Israel, and save them from their enemies. Ch. x., the people are entreated to turn to Jehovah in their troubles, and not to diviners and images. Jehovah will be the defender alike of Judah and Israel, restoring and strengthening them, and bringing low their oppressors. Ch. xi. announces the shock of war which appals the rulers of Judah (ver. 1-3). The rest of the chapter is allegorical. It represents Jehovah as rejected by His people, they being in turn rejected by Him, their true Shepherd. By an expressive figure, the brotherhood of Judah and Israel is declared to be broken. Ch. xii. 1 to xiii. 6, the nations come against Jerusalem; but Jehovah defends and saves it. The conflict is shown to be spiritual, for a spirit of grace and supplication is to be poured upon Judah and Jerusalem. Also a fountain is to be opened for the cleansing of guilt, and the idols and false prophets are to be banished. Ch. xiv.—Again Jerusalem is besieged, and this time it is taken, half the people going into exile; but the residue are saved. After various figurative illustrations of the processes and results of the Messianic reign, it is declared that the survivors among the nations shall go up to worship in Jerusalem, which shall be wholly consecrated to Jehovah.

Zedekiah, zēd-ē-kī'ā, the last king of Judah of the line of David. He was the third son of Josiah and Hamutal and his name was originally Mattaniah. At 21 he was appointed by Nebuchadnezzar to succeed his nephew Jehoiachin (whom he had carried to Babylon) as king of Judah (about 599 B.C.), and changed his name to Zedekiah. He took an oath of allegiance to Nebuchadnezzar, which he afterward broke, and entered into a league with Egypt against him. His action in so doing was denounced by the prophet, Jeremiah, who, as well as Ezekiel, then in Chaldea, predicted the approaching fall of Jerusalem. Jerusalem was besieged by Nebuchadnezzar and taken in 588 B.C., after a siege of a year and a half, the temple and city destroyed, and the leaders of the Jews carried captive. Zedekiah, whose sons were killed in his presence, had his eyes put out, and was carried in fetters of brass to Babylon, where he died, but the time of his death is unknown. His history is recorded in the books of Kings and Chronicles, and more fully in Jeremiah.

Zedlitz, tsēd'līts. **Josef Christian von**, Austrian poet: b. Johannsberg, Austrian Silesia, 28

Feb. 1790; d. Vienna 16 March 1862. He served in the Austrian army at the battles of Regensburg, Aspern, and Wagram, and afterward entered the service of the Austrian foreign-office. His dramas 'Kerker und Krone' (1834); 'Der Stern von Sevilla' (1830), etc., were long popular, but he is best known by his pleasing lyrics and ballads, 'Totenkranze,' a collection of elegies (1827); 'Soldatenbuchlein' (1848).

Zedlitz, von, Karl Abraham, BARON, Prussian statesman: b. Landshut, Silesia, 1731; d. 1793. He was appointed minister of justice in 1770, and was placed at the head of the department of ecclesiastic affairs and public instruction in the next year. He did much to uphold the liberty of the press and was a leader in the matter of prison reform. He resigned office in 1780.

Zedoary, certain species of *Curcuma*, natives of India, China, etc., whose rootstocks are aromatic, bitter, pungent, and tonic, and are used for similar purposes with ginger, although less effective. The round zedoary is the produce of *C. aromatica Zedoaria*, having palmate rootstocks, straw-colored within, which are used like turmeric for dyeing. Long zedoary is produced by *C. zerumbet*, having long palmate rootstocks, yellow within. Zedoary is a powerful sudorific, and is employed in the Orient in alterative medicines and for incense.

Zeehan, zē'han, Tasmanian, a mining township on the west coast near the base of Mount Zeehan, from which it takes its name, and 29 miles from the port of Strahan on Macquarie harbor. The township owes its existence to the discovery in 1884 of rich silver-lead ore in great abundance, extending over an area of more than 100 square miles. Pop. 10,000.

Zeeland, zē'lant, Netherlands. See ZEALAND.

Zeeman, Remigius, Dutch marine painter: b. Amsterdam about 1600; d. there about 1672. His real name was Nooms, but he received the name of Zeeman from painting marine subjects. There are a number of his works in the royal palaces at Berlin, where he resided for a number of years. He also produced several etchings of more than ordinary merit.

Zeeman Effect, a phenomenon highly important in connection with theoretical physics, discovered in 1807 by Dr. Pieter Zeeman, of the University of Amsterdam. It consists in the doubling (or further multiplication) of the lines of the spectrum of a substance, when the source of the light under examination is placed in a powerful magnetic field. (See SPECTROSCOPY.) The results that are obtained under varying conditions are too complicated to admit of full discussion in the present place. In general, however, it may be said that when the ray of light under examination travels in a direction parallel to the lines of force in the magnetic field, each line of its spectrum is separated into two lines, which are collectively known as a "magnetic doublet." The two components of such a magnetic doublet have (in general) the same intensity, and they are circularly polarized in opposite directions. Previous to Dr. Zeeman's discovery, no source of light was known, the rays from which were completely polarized, either circularly or otherwise. In order to ob-

serve the Zeeman effect properly, it is essential for the magnetic field to be both intense and uniform, and for the spectroscope to have a high resolving power. An idea of the order of magnitude of the phenomenon may be had from the following fact: In a magnetic field whose intensity is 10,000 C. G. S. units, each of the two well-known D lines of sodium is resolved into a doublet, and the separation of the constituents of either of these doublets is approximately equal to one twelfth of the distance between the original D lines.

When the ray of light under examination leaves the magnetic field in which it originates in a direction perpendicular to the lines of magnetic force, the phenomena that are observed are much more complicated. The lines of the spectrum are often observed to be triple, and not infrequently they are quadrupled, or even more complex. In all cases, however, each constituent of the modified line is completely polarized; but the polarization, instead of being circular as before, is now plane. The several constituents into which each primitive line is resolved may, in fact, be divided into two groups, one of which is polarized in a plane parallel to the lines of magnetic force, while the other is polarized in a plane perpendicular to those lines.

It will be observed that the Zeeman effect is due, apparently, to the influence of the magnetic field upon the ultimate molecular mechanism which is concerned in the very genesis of the light-ray; and herein lies its great theoretical importance. The ordinary theories of light treat of the propagation of luminous waves through the ether and through matter, *after* those waves have left their source; and little is known of the way in which a light-wave originates, at the atom which presumably gives it birth. The phenomenon discovered by Dr. Zeeman enables us to trace the consequences of modifying, by direct experimental means, the ultimate conditions that prevail at the very source of the light; and for this reason it is likely to lead to results of the highest importance with respect to the structure of matter and the nature of the ether and its motions. At the present day, physicists are of the opinion that the atoms which constitute matter are themselves composed of far smaller particles called "electrons" (q.v.), the electron, or ultimate unit in the structure of matter, being of the nature of a tiny disembodied charge of electricity. Light is believed to be due to the motions of these electrons within the atoms; and the Zeeman effect is believed to be due to the influence of the magnetic field upon the motions of the electrons. See LIGHT; ETHER; ELECTRON; SPECTROSCOPY. Consult, also, Cotton, 'Le Phenomène de Zeeman'; Lewis, 'Effects of a Magnetic Field on Radiation,' in the 'Scientific Memoir Series.' As the subject is now undergoing extensive investigation, reference should also be made to current scientific periodicals.

A. D. RISTEEN, PH.D.,

Editorial Staff, 'Encyclopedia Americana.'

Zegedin, Stephen de, Hungarian Protestant theologian: b. Zegedin 1505; d. Revin, Hungary, 2 May 1572. He studied under Luther and Melancthon at Wittenberg, and taught and preached afterward throughout the cities of Hungary; was taken prisoner by the Turks, who treated him with great cruelty. Among his

works were: 'Speculum Roman Pontificum Historicum' (1602); 'Assertio de Trinitate' (1573); 'Tabulæ Analyticæ in Prophetas, Psalmos, et Novum Testamentum' (1592).

Zegedin, Hungary, city in Csongrad, near confluence of the rivers Maros and Theisse. It is one of the largest towns in Hungary and has manufactures of woollens, leather, and toys. Being located adjacent to two navigable rivers, it controls the commerce of a large surrounding district. Pop. 35,000.

Zegers, zâ'gers, **Hercules**, Dutch landscape painter: b. about 1625. He was an artist and engraver of great merit, but notwithstanding the general excellence of his works he found great difficulty in disposing of them, and, becoming discouraged, fell into habits of intemperance. After his death his works sold for very high prices.

Zegers, Tacite Nicolas, Flemish theologian: b. Brussels in the latter part of the 15th century; d. there 1559. According to all authorities he was one of the greatest critics of his time. Among other works he published an edition of the New Testament in Latin (1559).

Zeila, zâ'la, **Zaylah**, or **Sela**, Northeast Africa, a seaport of the British Somali Coast Protectorate, on the Gulf of Aden, a few miles southeast of Jibuti, the port of French Somaliland. Its former commercial importance as the terminus of caravan routes from Harar and Shoa in Abyssinia, has diminished since the construction of a railroad from Jibuti to Harar. Pop. 12,000.

Zeiler, tsî'ler, **Martin**, German geographer: b. Styria 1589; d. 6 Oct. 1661. He was one of the foremost authorities of his time, and a voluminous writer on various subjects. He published some useful works on the geography and topography of Germany.

Zeisberger, tsîs'bêrg-er, **David**, American Moravian missionary among the Indians: b. Zanchenthal, Moravia, 11 April 1721; d. Goshen, Tuscarawas County, Ohio, 17 Nov. 1808. Educated in Saxony, he emigrated to Georgia in 1740, then went to Pennsylvania, and was one of the founders of the town of Bethlehem. In 1743 he became a missionary to the Indians, and labored until the breaking out of the Indian war in 1755 among the Delawares at Shamokin (Sumbury, Pa.), and the Iroquois at Onondaga. In the time of the Pontiac conspiracy, he assisted in ministering to the Christian Indians for whom the governor of Pennsylvania had provided a refuge at the barracks at Philadelphia. Peace having been concluded, he led the remnant of these Indians to Wyalusing, on the Susquehanna, in Bradford County, Pa. In 1767 he penetrated through the wilderness to Goshgoshunk, on the Allegheny, in Venango County, and established a church among the Monseys. He removed with his flock in 1770 to the Beaver Creek, and began another station, called Friedenstadt, in what is now Lawrence County; two years later explored the Muskingum region, in the present State of Ohio, and laid out an Indian town, Schoenbrunn, on the Tuscarawas. After a time he was joined by all the Moravian Indians of Pennsylvania, whom the march of civilization drove westward. Two more towns were built, a number of other missionaries entered the field, and many new converts were

added. In 1781 the Wyandots fell upon the settlement of the Christian Indians at Gnadenbutten and massacred many of them. This was a death blow to the Moravian mission among the Indians. With a small remnant Zeisberger built an Indian town, in what is now the State of Michigan, but in 1786, at the head of a small band of followers, he returned to Ohio, and in the following year commenced a new settlement, which he called New Salem, in Huron County. In 1791 the hostility of other Indians obliged them to emigrate to Canada, where they founded Fairfield, on the river Thames. In 1798 the United States Congress having granted to the Moravian Indians the tract of land in Ohio upon which they had formerly been settled, Zeisberger returned to that country with some of his converts, and near the ruins of their once flourishing towns established a new station, to which he gave the name of Goshen. There he preached until the close of his life. His published works are: a 'Delaware and English Spelling Book' (1776); 'A Collection of Hymns in Delaware' (1803); 'Sermons to Children,' in Delaware (1803). In recent years have appeared his 'Dictionary in German and Delaware' (1887); 'Diary of David Zeisberger 1781-98' (1888); and 'Essay toward an Onondaga Grammar' (1888). Consult Schweinitz, 'Life and Times of David Zeisberger' (1870).

Zeise, tsî'së, Heinrich, German poet: b. Altona (province of Schleswig-Holstein, Prussia) 19 April 1822. He was an apothecary successively in Altona and Copenhagen, and from 1863 to his retirement in 1875 was proprietor of a chemical manufactory at Altona. He finally settled in Grossflotbek, near Altona. During an extended journey through Norway, Sweden, and Denmark, he familiarized himself with Scandinavian literature, and subsequently he translated the writings of Oehlenschläger, Andersen, Høist, Jørgen, Moe and others, and works of natural history by Schouw and Oersted. Zeise's original verse is often careless in diction, but has generally a pleasing quality, and reaches a stirring note in his patriotic songs, many of which are among the more valuable in his collection of 'Deutsche Kriegs- und Siegeslieder' (1864). Among his volumes are: 'Reiseblätter aus dem Norden' (1848); 'Gedichte' (2d ed. 1852); 'Neuere Gedichte' (1850); 'Kampf- und Schwertlieder' (1849); 'Kleine Lieder' (1871); 'Aus dem Leben und den Erinnerungen eines Nord-Deutschen Poeten' (1888); and 'Natur- und Lebensbilder' (1892).

Zeising, tsî'sing, Adolf, German writer on æsthetics: b. Ballenstedt (Anhalt) 24 Sept. 1810; d. Munich 27 April 1876. He wrote 'Neue Lehre von den Proportionen des menschlichen Körpers' (1854); 'Ästhetische Forschungen' (1855); 'Religion und Wissenschaft' (1873); and several works of fiction. For a time he held a professorship in the Bernburg (Anhalt) gymnasium, but after 1853 devoted himself to letters, residing generally in Munich.

Zeitun, zâ-toon', or Zeitan, Asiatic Turkey, a town in the province of Aleppo, 25 miles northwest of Marash, in an iron-mining district, inhabited chiefly by Armenian Christians. The district is fertile but mountainous. The people,

distinguished by their martial spirit and their immunity from crimes of violence, are descendants of the Armenian kingdom which existed in Cilicia from the 11th to the 14th century. A sanguinary conflict with Turkish troops soon after the Crimean war drew European attention to the community, and it was stopped by the intervention of the British and French consuls. In 1878, 1890, and 1895 they defended themselves successfully from Turkish oppression, securing favorable conditions of peace. Pop. 20,000.

Zeitz, tsîts, Germany, a town in the province of Saxony, Prussia, on the Weisse Elster, 23 miles by rail southwest of Leipsic. A gymnasium, and a library in a former Franciscan monastery are among its educational institutions. It is a busy industrial centre with manufactures of woollens, cottons, calicoes, leather, hosiery, mineral oil, sugar, pianofortes, cycles, etc. Pop. (1900) 27,391.

Zela, zē'la, an ancient town of Asia Minor, in the Pontus, where Julius Cæsar defeated Pharnaces, king of Pontus and son of Mithridates, and announced his victory to the Roman Senate, in the famous brief despatch, *Veni, vidi, vici*—"I came, I saw, I conquered." This battle ended the war; Pharnaces escaped into Bosphorus, where he was slain by his lieutenant, Asander; Pontus was made a Roman province, and Bosphorus was given to Mithridates of Pergamus, 47 B.C.

Zelaya, thā-la'yā, Jose Santos, Nicaraguan statesman: b. Managua, Nicaragua, about 1845. Educated in England, he entered the Nicaraguan army and was made a general in 1885. He became the leader of the Liberal party and united with Joaquín Zavala in the revolt of April-June 1893, which resulted in the overthrow of President Sacaza. When Zavala was made provisional president Zelaya rebelled and Zavala was obliged to resign. A new constitution was then proclaimed, under which Zelaya was elected president 17 Sept. 1893. In the next year he invaded the Mosquito territory and in May 1895 an English force held the port of Corinto for a short time until Nicaragua agreed to pay indemnity for the murder of an English subject.

Zelaya, Mexico, a town of Guanajuato, on the Rio Grande de Santiago, 120 miles northwest of Mexico City. It is a cotton manufacturing centre. The chief buildings are a large and elegant cathedral and several convents. Pop. 10,000.

Zelko'na Tree, a large elm-like tree (*Plataner richardi*), native to the Orient. The timber is much prized, the heartwood when dry being exceedingly hard, capable of a fine polish, and an excellent furniture wood.

Zell, tsël, Karl, German philologist and archaeologist: b. Mannheim, Baden, 8 April 1793; d. Freiburg-im-Breisgau, Baden, 21 Jan. 1873. He studied in Heidelberg, Göttingen, and Breslau, was made professor of philology at Freiburg in 1821, and, as representative of the university in the first Baden chamber in 1831-5, secured a reorganization of the system of higher education in the grand duchy. He was made a member of the council for higher studies, with the title of ministerial councillor. From 1846

until his retirement in 1855, he was professor of archaeology at Heidelberg, where his lectures were very inclusive in their scope. His scholarship is amply shown by his studies of Aristotle and the Aristotelian philosophy. He was prominent in the Catholic Church, and president of the assemblies of the Catholic Union in 1852 and 1853. Among his writings are: 'Observationes Criticæ de Aristotele' (1817); 'Ethica Nicomachea' (1820); a translation (1834) of the 'Organon'; 'Bilder aus der Gegenwart' (1855); and some *opuscula academica*.

Zelle, tsɛl'le, Prussia. See CELLE.

Zeller, tsɛl'ler, **Eduard**, German theologian and historian of Greek philosophy: b. Kleinbottwar, Wurtemberg, 22 Jan 1814. He studied at Tübingen and Berlin, and was made *privat-docent* at Tübingen in 1840. Though bitterly opposed by the more orthodox, he became professor of theology at Bern in 1847, and at Marburg in 1849. Appointed to the chair of philosophy at Heidelberg in 1862, he went to Berlin in 1872 and retired in 1895. He early forsook theology and his Hegelianism for historical work which reveals the most impartial and eclectic spirit. Among his writings the following are the most important: 'Platonische Studien' (1839); 'Die Philosophie der Griechen,' his greatest work (1844-52; 4th ed. 1876-81); 'Das Theologische System Zwinglis' (1853); 'Die Apostelgeschichte kritisch untersucht' (1854; English trans. 1875-76); 'Vorlesungen und Abhandlungen' (1865; 2d ed. 1875-77-84); 'Staat und Kirche' (1873); 'David Friedrich Strauss' (1874); 'Geschichte der deutschen Philosophie seit Leibnitz' (1872); 'Friedrich der Grosse als Philosoph' (1886). His work on Greek philosophy has been translated into English under the titles 'Socrates and the Socratic Schools' (1868); 'Stoics, Epicureans, and Sceptics' (1870); 'Plato and the Older Academy' (1876); 'The Pre Socratic Philosophy' (1881); 'The Eclectics' (1883); 'Aristotle' (1897).

Zeller, zɛl-lär, **Jules Sylvain**, French historian: b. Paris 23 April 1820; d. there 25 July 1900. After study in Paris and afterward in Germany, he held the chair of history successively in the lycées of Rennes, Bordeaux, and Strasbourg, in the faculty of Aix, and in the Paris normal school. In 1863 he was made professor of history in the École Polytechnique, in 1874 member of the Academy of Moral and Political Sciences, and in 1876 inspector-general of higher education. His many works include such important studies as: 'Les Empereurs Romains' (1863); 'Entretiens sur l'histoire' (1865); 'Pie IX et Victor Emmanuel' (1879); 'Histoire de l'Allemagne' (1872-01); and 'Histoire Résumée de l'Allemagne' (1888).

Zem'indar, in India, the title of a class of officials created under the Mogul government of India. They have been regarded, first, as district governors; second, as landed proprietors, and, third, as farmers or collectors of the government revenue on land. In Bengal, the zemindar has all the rights of a British landed proprietor, subject to the payment of the land-tax, and also to a certain ill-defined tenant-right on the part of tenants who have long held possession of their farms.

Zena'na, the name given to the portion of a house reserved exclusively for the females belonging to a family of good caste in India. In Bengal the privacy of the zenana is guarded with peculiar strictness, the females being kept in absolute seclusion from all men except their husbands and fathers. The zenana is built at the back part of the house and has no windows except what look into an inner court.

Zenana Mission, a mission founded in 1852 under the auspices of the Protestant missionary societies in India, with the object (1) of sending the Gospel to the women of India by means of female missionaries; (2) of alleviating their sufferings in sickness, and ministering to their spiritual need, through the agency of duly qualified female medical missionaries; and (3) of promoting education, based on Holy Scripture, especially among women of the higher classes. See INDIA.

Zend, more correctly **Avestan**, an ancient Iranian language, in which the Zend-Avesta is composed. This language was first introduced to notice by Anquetil Duperron, and the accurate knowledge of it has been developed among others by Rask, Burnouf, Bopp, and Haug. It is now recognized to be a coeval and cognate dialect with the Vedic Sanskrit. It embraces two dialects called Bactrian, in contradistinction to the ancient languages of Media and Persia, which are called the Western Iranian, while the Zend or Bactrian dialects are called the Eastern Iranian dialects. The two Zend dialects consist of an earlier and a later, analogous to the Vedic and classic Sanskrit or to the Homeric and classic Greek. The period of transition between them is perhaps from 100 to 200 years. The earlier dialect is called the Gāthā, from the Gāthas or sacred songs which form the only remains of it; the later is that in which the greater part of the Zend-Avesta or Zoroastrian sacred writings are found. Both of these dialects had died out about three centuries before Christ, and the difficulty of studying them is greatly increased by frequent copying by persons unfamiliar with their forms. They differ both in grammar and pronunciation, they are both highly cultivated languages and rich in inflections, but the earlier is richer in inflections and the later in compounds. The earlier is distinguished by long vowel terminations, probably produced by transcribing the singing pronunciation of the gāthas. The present alphabet is comparatively modern, and is probably derived from the Syriac. There are 12 simple vowels, 14 diphthongs, and 29 consonants, represented by separate characters. The roots are mostly monosyllabic, some consisting only of a single vowel, others of a vowel and consonant or a vowel between two consonants. These primitive roots are modified by articulate additions, which extend or limit their meaning after the manner of prefixes and suffixes, thus *dā*, to make, with the addition of *th*, becomes *dath*, to place. Verbal roots undergo modifications producing three distinct forms, the causal, the desiderative, and the intensive. Verbs have three voices, active, middle (reflective), and passive; and four moods, indicative, subjunctive, potential, and imperative. Some of these moods are double. The tenses include one for the present, four for the past, and two for the future. Nouns are

formed from roots by means of suffixes. There are three genders, masculine, feminine, and neuter. There are also three numbers, singular, dual, and plural, with eight inflections in the first and last and five in the middle number. The forms of the declensions closely resemble those of Sanskrit; and there are many other analogies between the Gāthā dialect and the Vedic Sanskrit. See SANSKRIT LANGUAGE AND LITERATURE.

Ze'nith, the vertical point of the heavens at any place, that is, the point right above a spectator's head, and from which a line drawn perpendicular to the plane of the horizon would, if produced, pass through the earth's centre, supposing the earth a perfect sphere. Each point on the surface of the earth has therefore its corresponding zenith. The zenith distance of a heavenly body is the arc intercepted between the body and the zenith, being the same as the co-altitude of the body.

Zenith Sector, an astronomical instrument, consisting of a telescope swinging upon pivots, and having attached to it an arc graduated into degrees and minutes. It is used for the same purpose as the mural circle, namely, to ascertain the zenith distance of the several stars.

Zenith Telescope, an instrument used in field astronomy for the determination of latitudes, by the measurement of the difference of meridian-zenith distance of two stars, one culminating north of the zenith, and the other at so nearly the same distance south that that difference can be measured by a filar micrometer in the field of the telescope when the latter is revolved 180° round a vertical axis between the two culminations.

Zenjun, zēn-jūn', or Zinjan, Persia, a town in the province of Khamseh, 170 miles northwest of Teheran, on the highway to Tabriz. It has manufactures of carpets, woolen cloths, and arms. Pop. 20,000.

Zenkoji, zēn-kō'jē, Japan. See NAGANO.

Zeno, zē'nō, Emperor of the East (Byzantine empire) from 474 to 491 A.D. An Isaurian by birth, he married the daughter of Leo I, commanded the imperial guards and armies, and was elevated to the consulship in 469; procured the assassination of Aspar, the minister of Leo, in 471, and usurped the crown on the death of Leo in 474. He was driven out of his capital by Basiliscus, who was proclaimed emperor in 475, but regained Constantinople in 477 by buying over Harmatius, the nephew and general of Basiliscus, who was deposed and died shortly afterward. In 478 a Gothic invasion was bought off; in 479 a revolt in Constantinople was put down by corrupting the troops engaged; a second Gothic invasion was bought off, and a third was repelled by purchasing the aid of an opposing party among the Goths, one of whose chieftains, afterward Theodoric the Great, was made consul in 484. Having quarreled with Theodoric, Zeno, anxious to save himself and his capital, proposed to him to invade Italy, and expel Odoacer and the Heruli. Among the more important events of his reign was the publication of the so-called 'Henoticon' (482), or 'Decree of Union,' intended to adjust the controversy between the Monophysites (q.v.) and the Orthodox Church.

Zeno, dzā'nō, **Apostolo**, Italian dramatist and literary historian: b. Venice 11 Dec. 1668; d. there 11 Nov. 1750. He was a founder (1710) of the critical periodical 'Giornale de' Letterati d'Italia,' in 1718-29 was at Vienna as court-poet, and made his reputation in Italian literature by libretti for the musical drama, which in his work attained real literary rank. For many years he was the chief dramatic poet of Italy. He was also a scholar, antiquary, and well-known numismatist. His collected dramas appeared in 1744. Among his further writings is the 'Dissertazioni Storico-Critiche e Letterarie' (1752-3). Consult the 'Life' by Negri (1816).

Zeno, Nicolò and **Antonio**, Venetian navigators of the late 14th and early 15th centuries. Antonio about 1390 fitted a ship with which he sailed northward on the Atlantic. He was wrecked on one of the Faroe islands. Here he would have been killed by the Scandinavian natives had he not been opportunely rescued by Earl Smclair, whom Hacon VI of Norway had invested with the Orkneys and Caithness. He was made commander of the earl's small fleet, and in 1393 or 1394 sailed with three ships to Greenland, where he spent some time. He died in the Faroes about 1395. Antonio went out to the Faroes in 1391, and was in Smclair's service for 14 years, dying at Venice in 1406. After Nicolò's death he was commander of the fleet; and on one occasion, to verify fishermen's reports of land some 1,000 miles westward, he undertook a voyage of discovery in the Atlantic. He described his adventures in a letter, and on this letter and some others and a sailing-chart, probably made by Antonio, is based a work containing matter of some interest in connection with pre-Columbian discovery in the New World. The letters were worked into a narrative, and, with a copy of the map, appeared in book-form in 1558. The narrative says that a fisherman, returning to the Faroes after a 20 years' absence, told of a land called Estotiland, where there was much gold and forest. The people built small boats and traded with Greenland. The description of Estotiland is vague, and contains little to suggest North America. But a voyage was undertaken from Estotiland to a region southward, called Drogio. There, said the fishermen, the people were cannibals. "They have no kind of metal. They live by hunting, and carry lances of wood, sharpened at the point." Farther south, "they have cities and temples," as well as "some knowledge and use of gold and silver." The honesty of the Zeno narrative has been sufficiently well established; but whether or no the fisherman had the experiences he narrated in Drogio, and whether that may be identified with North America, are questions that have been much debated. Consult: Major, 'The Voyages of Nicolò and Antonio Zeno' (Hakluyt Society, 1873), with a translation of the narrative and a copy of the map; and Fiske, 'The Discovery of America,' Vol. I (1892).

Zeno (zē'nō) (Gk. Ζήνων), of Citiūm, ancient Greek philosopher. b. Citiūm, island of Cyprus. He flourished in the late 4th and early 3d century B.C., and was the founder of the Stoic school of philosophy (see STOICS). The circumstances of his life are not well known. Tradition says that after suffering shipwreck near

ZENO OF ELEA—ZENOBIA

the Peiræus, and according to one account losing his all, while by another his wealth amounted to 1,000 talents, he settled at Athens. There he early made himself remarked for the virtues of moderation and contentment, and during his long life he so acquired the esteem of the citizens that they voted him a crown of gold and a public burial in the Ceramicus. He is said to have declined the citizenship of Athens from fidelity to his native country. He first resorted to the teaching of the Cynic Crater, and by this school his own views, especially in the earlier period of his career, were much influenced. It may seem surprising that Zeno, who rejected both the contempt for established usages and for general knowledge which distinguished the Cynics, should have attached himself to that school, but the central point of every true system of philosophy is its ethics, and he was attracted to the Cynics by their doctrines of moral obligation, which he made the foundation of his own system. Contrary to the advice of Crater he afterward studied under Stilpo the Megarian. Among his subsequent advisers or teachers are enumerated the Megarians Cronus and Philon, and the Academics Xenocrates and Polemon. Of the last two he is said to have been a pupil. He maintained a friendship with Antigonus Gonatas, king of Macedon, of whom his disciples Persæus and Philonides were companions. About 310 B.C. he opened his school in the *Ποικίλη Στοά* (*Stoa*), or "Painted Porch." This place, which was adorned with paintings by Polygnotus, had formerly been the resort of a school of poets, who were from this circumstance called Stoics, and the name was now transferred from them to the disciples of Zeno, who at first had been called Zenonians. All the works of Zeno are lost. They were numerous, and include treatises 'On the State' (early and of cynical tendencies); 'On the Ethics of Crater'; 'On Life According to Nature'; 'On Impulse'; 'On the Nature of Man'; 'On the Affections'; 'On the Becoming' (or Fitting); 'On Law'; and 'On Grecian Education'; various treatises on physics, logic, and poetry, and a work on the Pythagorean doctrine. Concerning the doctrines of Zeno, which employed very largely the ethics of the Cynic school, as well as the physics of Heraclitus and Pythagoras, consult the article *Stoics* referred to above; also Zeller, 'Stoics, Epicureans, and Skeptics' (1870); Ueberweg, 'History of Philosophy' (Eng. trans. 1887); and Ritter and Preller, 'Historia Philosophiæ Græcæ' (8th ed. 1808).

Zeno (Gk. *Ζήνων*) of Elea, ancient Greek philosopher: b. Elea (Velia), Lucania, southern Italy, about 488 B.C. He was the favorite disciple of Parmenides, whose opinions he defended, and whose ethico-political schemes he shared. He appears to have lived for a considerable time in Athens, where he taught for remuneration, and had distinguished pupils, as Pericles and Callias. He is said, on unsatisfactory evidence, to have engaged in an enterprise on behalf of his native land against the tyrant Nearchus. Whether he perished in this attempt or survived is not known. None of his writings are extant, but his opinions are referred to by Aristotle, who attempted to confute some of them, and who has distinguished

him as the inventor of dialectic. As a defender of the Eleatic doctrine of the unity of the existent, he was the first to lay down the problems of skepticism in regard to the real existence of the phenomenal world, and has thus exercised an important influence on philosophy. He is said to have directed four arguments against the reality of motion, first from the impossibility of a moving body arriving at a place without passing through an infinite number of intermediate places; second, from the contradictoriness of relative notions of speed, based on the same reason; third, from the fact that each body at each particular moment must occupy one particular portion of space, and is therefore at rest; fourth, from the contradictoriness of relative notions of time in respect to motion, the same portion of time being regarded as long or short, according as it is measured by different standards. He is also credited with an argument against the veracity of sensuous impressions, which rests merely on an imperfect knowledge of physics. It is in this form. If a measure of millet-grains in falling produces a sound, each single grain, and each fraction of a grain, however minute, must also produce a sound; for as the results of the motion of the whole mass is but the sum of the results of the motion of its parts, if no sound is produced by the smallest of the parts, no sound can be produced by the whole. Aristotle, in his 'Physics' (VI.), pointed out the fallacies in the arguments against the reality of motion. Consult: Zeller, 'Pre-Socratic Philosophy,' Vol. I. (1881); Ueberweg, 'History of Philosophy,' Eng. trans. Vol. I (1887); Ritter and Preller, 'Historia Philosophiæ Græcæ' (8th ed. 1808); and Zeller, 'Philosophie der Griechen,' Vol. I. (4th ed. 1900).

Zenobia, zē-nō'bī-a, queen of Palmyra (q.v.). She was instructed in the sciences by the celebrated Longinus, and made such progress that besides her native tongue she spoke the Latin, Greek, Coptic, and Syrian languages. She also patronized learned men, and herself formed an epitome of Egyptian history. She was married to Odenathus, king of Palmyra, accompanied him both in the war and the chase, and the success of his military expedition against the Persians is, in a great degree, attributed to her prudence and courage. Gallienus, in return for services which tended to preserve the East to the Romans after the capture of Valerian by Sapor, king of Persia, acknowledged Odenathus as emperor, and on his death, 267 A.D., she assumed the sovereignty, under the title of Queen of the East. She preserved the provinces which had been ruled by Odenathus, and was preparing to make other conquests, when the succession of Aurelian to the purple led to a remarkable change of fortune. That martial prince, disgusted at the usurpation of the richest provinces of the East by a female, determined to make war upon her; and having gained two battles, Antioch and Emesa, besieged her in Palmyra, where she defended herself with great bravery. At length, finding that the city would be obliged to surrender, she quitted it privately; but the emperor, having notice of her escape, caused her to be pursued with such diligence that she was overtaken just as she got into a boat to cross the Euphrates, in 272 Aurelian spared her life, but made her serve to grace his

triumph. The Roman soldiers demanded her life; and according to Zosimus she purchased her safety by sacrificing her ministers, among whom was the distinguished Longinus. She was allowed to pass the remainder of her life as a Roman matron; and her daughters were married by Aurelian into families of distinction. Her only surviving son retired into Armenia, where the emperor bestowed on him a small principality. Consult: Gibbon, 'Decline and Fall' (ed. Bury, 1896-1900); 'Life of Aurelian' by Vopiscus in 'Augustæ Historiæ Scriptores' (Eng. trans. Bernard, 1740); Ware, 'Zenobia, or The Fall of Palmyra' (1836).

Zenobia, or The Fall of Palmyra, a noted historical novel, first issued in 1836 in the 'Knickerbocker Magazine,' and then entitled 'Letters from Palmyra.'

Zenos, zē'nōs, **Andrew Constantinides**, American educator: b. of Greek parentage, Constantinople, Turkey, 13 Aug. 1855. He was graduated at Robert College, Constantinople, in 1872, studied theology at Princeton Seminary and was pastor of a Presbyterian church in Brandt, Pa., 1881-3. From 1883 to 1888 he was professor of Greek in Lake Forest University and of New Testament exegesis at Hartford Theological Seminary 1888-91. In 1891 he was made professor of church history in McCormick Theological Seminary in Chicago, and in 1894 was transferred to the chair of Biblical theology in that institution, a position he still (1904) holds. He wrote: 'Elements of Higher Criticism'; 'Compendium of Church History' (1896), etc.; and edited Xenophon's 'Anabasis' (with F. W. Kelsey) (1888).

Zenta, zēn'tō, Hungary, a town in the county of Bács-Bodrog, on the Theiss, 120 miles southeast of Budapest. Here, 11 Sept. 1697, the Germans under Prince Eugene, defeated the Turks, a victory which led to the peace of Carlowitz, ratified January 1699. Pop. (1900) 28,588.

Zé'olite, a name given to a group of hydrated silicate minerals commonly found in cavities in igneous rocks, from which they are derived through secondary alteration. They include thompsonite, natrolite, scolecite, analcite, chabazite, gmelinite, phillipsite, harmotome, stilbite, and heulandite. The name is derived from the boiling reaction before the blowpipe.

Zephaniah, zēf-a-nī'a, the ninth in order of the Scriptural writers known as the minor prophets. His pedigree is traced back for four generations. He is the son of Cushi, the son of Gedaliah, the son of Amariah, the son of Hizkiah, and he is supposed to have been of noble, if not of royal, ancestry. His brief but pregnant prophecy was delivered just after the time of the first appearance of Jeremiah (626 B.C.)—that is, in the first half of the reign of Josiah. The next preceding prophet was Micah, who died in the early part of the reign of Manasseh. But the condition of the whole of western Asia, including Palestine, portended a speedy upheaval. Above all, Nineveh was beginning its memorable decline after the death of its king, Assur-banipal (668-626 B.C.). Morally and religiously the Jewish nation had improved but little since the degeneracy that had followed the death of Hezekiah, and Josiah's reform (621 B.C.) had not yet begun, if we may

judge the invectives on idolatrous practices. Zephaniah was apparently a descendant of King Hezekiah.

The Prophet's Message.—Zephaniah spoke and wrote primarily for the correction and warning of Judah and Jerusalem, though he draws illustrations from the sins and fates of other peoples. The culmination of these is found in the iniquities, the pride, and the speedy fall of Nineveh. A division into four parts is as follows:

The threatening: ch. i. 1, the whole world—that is, the Semitic world—is to undergo exemplary punishment, particularly Jerusalem and its apostates from Jehovah (ver. 1-6). (2) The classes of people who are to be thus visited—the royal house, the nobles, the wealthy traders, the careless and defiant generally—are characterized, and their chastisement set forth in language largely figurative (ver. 7-18).

The lessons from the nations: ch. ii. God's own people are warned to repent in time (ver. 1-3), and so avoid the doom that is about to fall upon the Philistines (ver. 4-7), Moab (ver. 8-11), Egypt, under the name of Ethiopia (ver. 12), and finally Assyria and Nineveh (ver. 13-15).

The remonstrance: ch. iii. 1-7. Rebellious and obstinate Jerusalem is urged to repent by the righteous and reasonable God, in view of coming woes; for the lesson of the fate of other nations has so far been unheeded.

The promised redemption: ch. iii. 8-20-1. The faithful remnant is bidden to wait and trust. It shall survive the ruin of the nations, be joined by exiled brethren from far and near, and rest in quiet content (ver. 8-13). (2) Joyous thanksgiving is now in place, for Jehovah is in the midst of Jerusalem, to comfort and bless his people. Their reproach is taken away, dispersion and captivity are at an end.

Zeph'yr, a soft, cool, agreeable wind; in Greece the west, or rather west-southwest wind. The Greek name, according to the etymology, signifies life-bringing, because at the time when this wind begins to blow, the plants are restored to life by the balmy spring air.

Zephyran'thes, a genus of *Liliaceæ*, indigenous to the warmer regions of America, and most commonly represented by the atamasco lily (q.v.). The species are bulbous, and are not hardy in the Northern States, but make charming summer-blooming window and greenhouse plants, resting in the winter. The foliage is linear, springing from the bulb, and a scape, appearing at the same time, is crowned by a regular, 3-merous corolla which is nearly, or quite, erect, from 1 to 3 inches across, and red, yellow, or white in color. *Z. candida* is one of the white-flowered species, and is also one of the hardiest and thriftiest. It is a lovely, crocus-like plant, with pure-white blossoms opening out flat in the sunshine, and evergreen foliage.

Zephyrus, zēf't-rūs, in Greek mythology, a son of Æolus, or of Astræus and of Aurora, a lover of Chloris or Flora. By the harpy Podarge he was the sire of the swift horses of Achilles, Xanthos, and Balios. His love being rejected by Hyacinthus, he was the cause of his death by blowing Apollo's quail against his head. Some make him the husband of one of the Hours. Flowers and fruits are under his

protection." He is represented as a gentle beautiful youth, naked, with a wreath on his head, or flowers in the fold of his mantle.

Zeppelin, tsép'pé-lin, **Ferdinand**, COUNT von, German inventor. b. Constance, Baden, 8 July 1838. He took part in the Franco-German war as an officer of cavalry; arose to the rank of lieutenant-general in the German army; and was attached to the suite of the king of Wurtemberg. He became known for his experiments in connection with dirigible balloons. His first ascent was on 6 July 1892 at Bern, the balloon safely arriving at Lucerne. On 2 July 1900 he made an ascent at Manzell, near Friedrichshafen, on Lake Constance, in "one of the most ingenious, expensive, and carefully constructed balloons of modern times." This balloon rose 1,300 feet, traveled 3½ miles in 17 minutes in a prescribed direction, and was finally forced only by an accident to the sliding-weight and one of the rudders to descend, which it accomplished with perfect ease. On 17 October, Zeppelin undertook a second ascent, the balloon on this occasion remaining in the air for an hour at an average height of about 2,000 feet, making noticeable headway and remaining in perfect control against a seven-mile wind. See **BALLOONS**.

Zerafshan, zër-af-shan', Asiatic Russia, a river rising in a valley at the junction of the Hissar and Turkestan Mountain chains, and after a westerly by north course of about 400 miles, passing the towns of Penjakent, Samarkand, Katakurgan, Kernunch, and Bokhara, dispersing itself in the desert sands between Karakul and the Oxus River. A railway line traverses the valley from Karakul to near Penjakent.

Zerah, a king of Ethiopia, known to the Egyptians as Azech Amen, who flourished in southern Egypt about 900 B.C. He conquered Egypt and invaded Palestine, where Asa, king of Judah, completely defeated him, as a consequence of which Zerah abandoned not only Palestine, but also Egypt.

Zerbi, **Gabriel**, Italian physician and anatomist; b. Verona in the 15th century; d. there 1505. After many years of study he lectured for some time at Rome, and became professor of medicine at Padua in 1495. His chief work is 'Anatomy of the Human Body' ('Liber Anatomie Corporis humani'), published about 1490, which contains the germ of several discoveries in anatomy.

Zerboni di Sposetti, **Joseph**, German philosopher; b. Breslau 1706; d. 1831. Having written, in 1796, a letter to the governor of Silesia, showing the unreasonableness of attaching an unlimited importance to the right of birth in the nobility, he was imprisoned for three years on a charge of high treason, by order of Frederick William III. Being at last brought to trial he was liberated, and was subsequently employed in several public offices.

Zerbst, tsërpst, Germany, a town in the duchy of Anhalt, on the Nuthe, 21 miles southeast of Magdeburg. The chief buildings are the great Schloss in a fine park; the 15th century Nikolaukirche; and the stately 15th century Rathaus on the market place where are the

Roland column (1445), and the Butterjungfer, a slender column bearing a female figure. The chief educational institution is the Franciscum, a gymnasium of high repute. The town has manufactures of noted bitter beer, of silks, plush, cloth, leather, machinery, musical instruments, etc. Zerbst was founded in 1007. From 1603 to 1793 it was the capital of a principality of the same name, which in 1797 was absorbed in Anhalt-Dessau. Pop. (1900) 17,094.

Zerffi, **George Gustavus**, English author; b. Hungary 1821; d. Chiswick, England, 28 Jan. 1892. He edited a newspaper at Budapest, and in 1848 served as a captain in the revolutionary army. He also acted for a time as Kossuth's private secretary. On the failure of the revolution in 1849 he came to England and was naturalized, and some years later was engaged as a lecturer in the department of art at South Kensington. Throughout his career Zerffi gave much attention to the subjects of decoration and history, and wrote many works treating these themes in a comprehensive manner. He maintained that history should be studied as a whole on philosophical principles. He planned a general work on these lines entitled 'Studies in the Science of General History' in two volumes, dealing with ancient and medieval history respectively. Among his other publications are 'A Manual of the Historical Development of Art, with Special Reference to Architecture, Sculpture, Painting and Ornament' (1876); and an English version of Goethe's 'Faust' with critical and explanatory notes (1850).

Zeri'ba, or **Zaree'ba**, a temporary military enclosure, the sides of which are formed of prickly brush wood, sheltered by which a force may camp comparatively safe from sudden surprise. The term came into prominent use during the Anglo-Egyptian campaign of 1884.

Zermatt, tsër-mat', or zër-mat', Switzerland, a mountain village and tourist-resort in the canton of Valais, at the foot of the Matterhorn and near the head of the Visp Valley, 22½ miles by rail southwest of Visp. It stands 5,315 feet above sea-level, having to the south the great Theodule glacier, above which tower the Breithorn on the east, and beyond the Monte Rosa group, and on the west the rocky cone of the Matterhorn. An electric mountain railway connects with the Riffelberg and the summit of the Gornergrat (10,200 feet). The Théodule Pass or Matterjoch (10,800 feet) leads to Aosta in Italy. In the village churchyard are the graves of many victims of mountaineering. Pop. (1900) 752.

Zero, in mathematics, the absence of magnitude; the remainder that is obtained when any quantity is subtracted from itself; nothing, considered as a quantity; that which separates real positive quantities from real negative quantities. Zero is denoted by the symbol 0 ("cipher"), and this symbol itself is often called "zero." In the theory of functions, any value of a variable which reduces a given function of that variable to zero is called a "zero" of the given function. In infinitesimal analysis, infinitesimal quantities are sometimes called zeros. This usage is incorrect, and it leads to confusion of thought. An "infinitesimal" has an actual magnitude, and although that magni-

tude is smaller than any quantity that can be definitely stated or assigned, the fact that it exists distinguishes the infinitesimal from zero, properly so-called.

In physical measurement, the "zero" of any scale is the starting point from which measurements on that scale are reckoned. In thermometry (q.v.) it is customary to distinguish three different kinds of zeros. These are, respectively, (1) the arbitrary zero, (2) the "natural" zero, and (3) the "absolute" zero. The arbitrary zero on such a scale is a zero that is selected arbitrarily, as a convenient point of reference; the selection being governed by practical considerations of convenience, or by the facility with which the point can be experimentally determined. (See THERMOMETER.) The "natural" zero is employed chiefly in connection with the gas thermometer. In a gas thermometer in which the temperature is indicated by the expansion of a given volume of gas at constant pressure, the "natural" zero is the temperature at which the volume of the gas would just vanish, if the contraction of the gas were to follow, at very low temperatures, the law of variation with temperature that prevails between the freezing and boiling points of water. Similarly, in a gas thermometer in which temperature is measured by the change in pressure of a mass of gas that is confined at constant volume, the "natural" zero is the temperature at which the pressure of the gas would just vanish, if the law of variation of pressure were the same, at very low temperatures, as it is between the freezing and boiling points of water. The "natural" zeros of the various gas thermometers that are in actual use are not identical, but their positions differ only by a few degrees, at the most.

The "absolute" zero of temperature is the temperature that a body would have, if it were absolutely deprived of heat; and this "absolute" zero is identically the same for all substances. It happens that the "absolute" zero has nearly the same position on the thermometric scale as the "natural" zeros of the various gas thermometers that are in use, and this fact has led to a great deal of confusion in popular and semi-scientific writings upon the subject of temperature, the "natural" and "absolute" zeros being very commonly confounded with one another. The "absolute" zero is slightly lower than the "natural" zero of any gas thermometer that we know of, with the possible exception of the "natural" zero of the hydrogen thermometer. There is some reason for believing that the "natural" zero of the normal hydrogen thermometer (whether at constant volume or at constant pressure) is a few hundredths of a centigrade degree lower than the true "absolute" zero. If further research bears out this opinion, then it is plain that the "natural" zero of the hydrogen thermometer can never be attained; for the "absolute" zero, being the temperature corresponding to absolute cold, is the lowest temperature that can possibly have a real existence. On the absolute centigrade scale, the temperature of the "absolute" zero is approximately 273.10° below the freezing point of water. This estimate is probably in error by a few hundredths of a degree. There is no theoretical reason why the position of the "absolute" zero cannot be determined to the thousandth of a degree; but the experimental data

required for such a determination are not yet available. See THERMODYNAMICS.

A. D. RISTEEN, Ph.D.

Editorial Staff, *Encyclopedia Americana*

Zer'rahn, Carl, American musical conductor; b. Malchow, Mecklenburg, 28 July 1826. In 1848 he came to America and six years later became director of the Handel and Haydn Society of Boston. He was conductor of the Harvard Symphony concerts 1861-82, and for several years was a successful director of famous musical festivals throughout New England.

Zerubbabel, zŕ-rŭb'a-bĕl, leader of the first band of Israelitish exiles returning from Babylon. His name in the Captivity was Sheshbazzar. He was the recognized prince of Judah, and on arrival at Jerusalem, with Jeshua, the high-priest, directed the renewal of public daily worship and of festival days, and in the second month of the second year of the return, the reconstruction of the Temple. This last work was stopped by their foes and revived only after 16 years, when it was again undertaken and finally completed by Zerubbabel and Jeshua.

Zeta, zĕ'ta, a small closet or chamber; applied by some writers to the room over the porch of a Christian church, where the sexton resided.

Zet'land Islands. See SHETLAND.

Zeuglodon, zŕ'glō-dŏn, a gigantic fossil cetacean mammal, found in the Eocene and Miocene strata of the southern United States and Europe, so named by Owen from the yoke-like character displayed by a section of the molar teeth. Its remains were first discovered in 1834 in the Tertiary of Louisiana, and were supposed to belong to some reptile, to which Dr. Harlan gave the name of *Basilosaurus*; but Owen showed that it was a mammal, and belonged among cetaceans. A few years later a German collector named Koch collected great quantities of the bones and stringing them together in some semblance of a natural skeleton, constructed a "sea-serpent," mostly neck and tail, no less than 114 feet long, which was exhibited widely in America and Europe, and required the exertions of eminent men (for example, Wyman, 'Proc. Boston Soc. Nat. Hist.,' November 1845) to expose as a humbug. The form was probably cetacean, though slender, elongated, and more snake-like, with small anterior limbs in the shape of paddles, and no hind limbs; the skin was supplied with an armor consisting of small irregular bony plates more or less fused together. The skull in some specimens was nearly a yard in length. It is well constructed, the blow-hole in the middle of the face, and the brain-cavity. The teeth are limited in number and disposed in three series as incisors, canines, and molars; the molars are double-rooted, and have serrated crowns. Much discussion has occurred as to the affinities of this great sea-beast, whose characters are so generalized, and period of existence so early that it is now agreed to be a representative of the most primitive *Cetacea*, and is set apart as a family, *Zeuglodontidae* constituting a primitive order *Archaeoceti*. Consult Woodward, 'Vertebrate Paleontology' (New York 1898); Zittel-Eastman, 'Text-Book of Paleontology,' Part III.

ZEUGMA — ZEUXIS

Zeugma, *zēgma*, the connection of one word with two words or with two clauses, to both of which it does not equally apply; so that, for one of them, another word (to be gathered from the sense of the passage) must be mentally supplied. Zeugma is therefore a species of ellipsis; both abbreviate discourse. Where the word to be supplied is a form of another in the sentence, as "I love you, and you [love] me," the construction is elliptical; where the sense requires a different word, as "The sun shall not burn thee by day, neither the moon [injure thee] by night" (Ps. cxxi. 6, Prayer Book), it is *zeugma*.

Zeus, *zūs* (Greek *Zeús*), in Greek mythology, the chief of the gods. He was the son of Cronus and Rhea. According to the myth Cronus was in the habit of swallowing his children immediately after their birth. When Zeus was about to be born Rhea consulted Uranus and Gaia as to how he might be saved, and they sent her to Crete (the Trojan Ida and other places are mentioned in other accounts) to be delivered. She concealed Zeus in a cave in Mount Ida, and gave Cronus a stone wrapped up in a cloth to swallow. The infant Zeus was tended by the nymphs Ida and Adrastea; he was supplied with milk by the goat Amalthea, and the bees gathered honey for him. When he had reached manhood, by the aid of Gaia or Metis he persuaded his father to restore to the light the children he had swallowed. Zeus now united with his brothers to dethrone his father, a change of government which led to a war with the Titans. This struggle was not terminated until Zeus delivered the Cyclopes, sons of Uranus and Gaia, who had been bound by Cronus, and who in return provided him with thunder and lightning, and also liberated the hundred-handed beings Briareus, Cottus, and Gyes, who likewise lent him their aid. Having vanquished the Titans, the other children of Uranus and Gaia, he shut them up in Tartarus. Tartarus and Gaia now begot another monster, Typhoeus, who engaged in a fearful struggle with Zeus, but was finally vanquished by a thunderbolt. Zeus now obtained the dominion of the world, which he divided by lot with his brothers Poseidon (Neptune), who obtained the sea, and Hades (Pluto), who received the lower world. Zeus himself possessed the heavens and the upper regions, while the earth was held as common property. Another dreadful war was now waged against the Olympian gods by the giants who were sprung from the blood of Uranus. In this struggle the gods were assisted by Athene, Apollo, Heracles, and other children of Zeus, and the giants were completely vanquished. Zeus had three sisters as well as three brothers, namely, Hestia (Vesta), Demeter (Ceres), and Hera (Juno). He first married Metis, a daughter of Oceanus and Tethys; but as Fate had prophesied that she should bear a son who should rule the world, Zeus swallowed her when she was with child, and Athene subsequently sprung from his head. As his second wife he took for a time Themis, daughter of Uranus and Gaia, but his final and best beloved wife was his sister Hera, by whom he had Hebe, Ares, and Hephaestus. Zeus was regarded as the founder of law, order, and authority, the avenger of wrongs, the punisher of crime, the rewarder of good actions, the source of prophetic

power, the author of all good things, and, in short, as the omnipotent, all-wise, and benevolent ruler of the universe. He was especially looked upon as the controller of all the phenomena of the heavens, and was constantly spoken of as the "Cloud-gatherer" or the "Thunderer." Notwithstanding his general character of wisdom and benevolence, his conduct was anything but immaculate. The incongruity struck some of the ancients themselves, and led to protest against such stories being believed. There appear to have been various local gods of the same name, with various attributes and legendary histories, who were finally merged in the national Hellenic Zeus; traces of the original traditions, however, remained in the local rites of particular localities. An Arcadian and a Cretan Zeus are particularly distinguished. The former had a temple at Mount Lycaeus, so sacred that if any one entered it he died within 12 months, while intentional trespassers were stoned to death. In Crete there were many places sacred to Zeus, who had passed his early life there, particularly Mount Ida and the district around it. Zeus also landed on the island at Gortyn in the shape of a bull, when he carried off Europa, and was worshipped there by the surname of Hecatombeus. The national god was worshipped by sacrifices of bulls, cows, and goats. Two of the principal localities where his worship was carried on in Greece were Athens and Olympia. At the latter place the Olympic games, the most splendid festival in Greece, were held in his honor. (See OLYMPIC GAMES.) Here there was a magnificent temple and a gold and ivory statue of the god, the work of Phidias, and reckoned one of the seven wonders of the world. In representations of Zeus the attributes in connection with him are the eagle, the sceptre, and the thunderbolt. Consult Preller-Robert, 'Griechische Mythologie' (1887).

Zeuss, *tsóis*, **Johann Kaspar**, German philologist and historical scholar: b. Vogtendorf, near Kronach, in Upper Franconia, 22 July 1806; d. there 10 Nov. 1856. He was educated in Munich, and became professor of history in the lycée at Bamberg (Upper Franconia). He wrote several valuable books—'Die Deutschen und die Nachbarstämme' (1837); 'Die Herkunft der Bayern von den Markomannen' (1839); 'Traditiones Possessionesque Witzemburgenses' (1842); 'Die Freie Reichstadt Speier vor ihrer Zerstörung' (1843). But his greatest work was 'Grammatica Celtica' (1853; 2d ed., by Ebel, 1868-71), a pattern of scholarship and thorough method, in which he really founded the science of Celtic philology.

Zeuxippus, *zūk-síp'ūs*, one of the eight successors of Zeno of Elea (q.v.) in the last school of Greek skeptics. Of him, as of all the others with the exception of Sextus Empiricus (q.v.), nothing further is known. Consult Zeller, 'Outlines of the History of Greek Philosophy' (trans. Alleyne and Abbott, 1886).

Zeuxis, *zūk'sis* (Greek *Zeûxís*), ancient Greek painter. He was a native of Heracleia, but which town of that name was his birthplace is not certain. He was born about the middle of the 5th century before Christ, and flourished about the end of the 4th century B.C. He is said by some authorities to have studied under Demophilus of Himeria, by others under

Nescas of Thasos. He also studied at Ephesus. Aristotle says that an elevated conception of character was wanting in his work, while Cicero praises him along with Polygnotus and Timanthes for *forma et lineamenta*. He learned from Apollodorus the treatment of light and shade, which he greatly developed, and from Phidias to take Homer's descriptions of his heroes as ideal models and to paint them with limbs larger than the ordinary human proportion. One of his most famous works was a picture of Helen for the temple of Hera at Croton. The rivalry of Zeuxis and Parrhasius is represented in a well-known story about a contest in which Zeuxis painted grapes at which the birds pecked, and Parrhasius a curtain which Zeuxis wished to have raised in order to see the picture. Some of his later works he gave away as being valuable beyond any fixed price. As far as may be judged from extant accounts, he painted small works on panels in contrast to the large mural paintings of Polygnotus. It is of course now impossible to form a correct idea of his art, though more anecdotes are told of him than of any other painter of antiquity. These are to be found in Lucian, Cicero, and especially the 'Historia Naturalis' of Pliny.

Zevecot, zäv-kō, **Jacques** (ZEVECOTIUS), Dutch poet: b. Ghent 1604; d. 1646. For a time he was a barrister, but subsequently he became a friar of the rule of St. Augustine, and wrote Latin verse which made him widely and favorably known. He visited Rome in 1624 and declined flattering offers of preferment from Pope Urban VIII. In 1625 he made open profession of Protestantism, and later was appointed professor of history and eloquence in the University of Harderwijk (Gelderland). Certainly in the Netherlands, if not beyond, he was esteemed the best Latin poet of his time. The best edition of his verse is 'Jacobi Zevecotii Poematum Editio Ultima' (1740).

Zeyer, tsī'ēr, **Jules**, Czech author: b. Prague 1842. After travel in France, Germany, Italy, Greece, and Russia, he became an instructor in the last, and published a number of volumes highly rated in literature. In prose these include 'Count Xavier,' and 'Andrew Cernysev,' the period of which is that of Catharine II.; in verse, 'Vyschrad,' a series of epic poems, the subjects of which are derived from the early history of Bohemia.

Zeizschwitz, tsētsh'vish, **Gerhard von**, German Lutheran theologian: b. Bautzen (Saxony) 2 July 1825; d. Erlangen 20 July 1886. Educated in the University of Leipsic, he became pastor at Grossschöcher (near Leipsic), but subsequently passed from a lectureship in the university to an extraordinary professorship there. Still later he held chairs in Giessen (from 1865) and Erlangen (from 1866). He was in his time an authority in the department of practical theology. A full list of his volumes cannot be given here; but they number such solid compendiums as 'System der Christlich-Kirchlichen Katechetik' (1863-72; 2d ed. of Vol. II. 1872-4); 'System der Praktischen Theologie' (1876-8); and 'Die Christenlehre im Zusammenhang' (2d ed. 1883-6). Consult 'Zur Erinnerung an Gerhard von Zeizschwitz' (1886).

Zhob, zhōb, Northwest Indian river of Lewistan, British Baluchistan, which joins the Gomul northwest of the Sulman Mountains, and with it flows into the Indus near Dera Ismael Khan. The Gomul and the Zhob valleys—the latter of which was annexed by Great Britain in 1889—are passes into Afghanistan of strategic value.

Zhukovskii, zhoo-kōf'ski-ī, **Vasilii Andreevich**, Russian poet: b. government of Tula, Russia, 20 Jan. 1783; d. 12 April 1852. He served in the campaign of 1812 against Napoleon, later settled in Dorpat, in 1816 obtained an imperial pension, and in 1826 became tutor to the Tsarevitch, later Alexander II. His most important service to Russian literature is to be found in his translations of the poems of Byron, Gray, Moore, Scott, Goethe, Schiller, Rückert, and others; 'Don Quixote'; the 'Odyssey'; and various further foreign classics. Among his original verses, 'Liudmilla,' an imitation of Bürger's 'Lenore,' and 'The Minstrel in the Russian Camp' were the most successful. Examples of them were turned into English verse in Bowring's 'Specimens of the Russian Poets' (1821-3).

Ziegenbalg, tsē'gēn-bālg, **Bartholomäus**, German missionary: b. Pulsnitz (Saxony) 24 June 1683; d. Tranquebar (Coromandel coast) 6 March 1719. He obtained a university training at Halle, and in 1705 sailed from Copenhagen for Tranquebar in response to the call of Frederick IV. of Denmark for missionaries to the Danish possessions in India. He compiled a grammar of Tamil and two lexicons, and translated the New Testament and the Pentateuch. His labors were effective despite much opposition. He was the first Protestant missionary to India. Consult: Germann, 'Ziegenbalg und Plutschau' (1808); and Plitt, 'Kurze Geschichte der Lutherischen Mission' (1871).

Ziegler, tsē'gler, **Friedrich Wilhelm**, German actor and dramatist: b. Brunswick 1750; d. Pressburg 21 or 24 Sept. 1827. He first appeared in 1784 at Vienna, and from that time until his retirement in 1822 he was connected with the Court Theatre there, holding excellent place. Of his many dramatic works, the comedy 'Die Temperamente' and the drama 'Paterwuth' were among those of less ephemeral value.

Ziegler, Karl, Austrian poet: b. Saint Martin, Upper Austria, 12 April 1812; d. Vienna 20 May 1877. He studied at the University of Vienna, was in the government service from 1835 until his retirement in 1857, and subsequently devoted himself to literature. He contributed largely to the literary periodicals and "annuals" of the time, and under his pseudonym of "Carlopagio" published a collection of 'Gedichte' in 1843. His other volumes were 'Himmel und Erde' (1856); 'Oden' (1866); and 'Vom Kothurn der Lyrik' (1869). His verse is simple and original in quality, and was once extremely popular, especially in literary circles.

Ziegler, Theobald, German philosopher: b. Göppingen, Württemberg, 9 Feb. 1846. He studied in Tübingen, from 1871 was an instructor in various gymnasia, in 1884 was appointed lecturer on philosophy and pedagogy in the University of Strasburg, and in 1886 professor there. His 'Sittliches Sein und Sittliches Wer-

den' (2d ed. 1890; English 1892) was a substantial enrichment of the literature of moral philosophy, and the 'Geschichte der Ethik' (2d ed. 1892) is also a work of importance. His further volumes include: 'Religion und Religionen' (1893); and 'Fr. Th. Vischer' (1893).

Ziegler, William, American capitalist: b. Beaver County, Pa., 1 Sept. 1843. He at first entered the printers' trade, and in 1868 the bakers' and confectioners' supplies business. In 1870 he organized the Royal Chemical Company, which he developed into the Royal Baking Powder Company, retiring from active business in 1886. He also operated largely in real estate. He fitted out the Ziegler expedition to explore the Arctic by way of Franz Josef Land, and, if possible, reach the North Pole. The expedition, Commander Fiala, left Vardo, Norway, 10 July 1903.

Ziegler und Klipphausen, oont klíp'how-zén, **Heinrich Anselm**, German poet: b. Radmeritz, Upper Lusatia, 6 Jan. 1603; d. Liebert-wolkwitz, near Leipzig, 8 Sept. 1696. He was educated at Frankfurt-on-the-Oder, and lived as a landed proprietor. His chief work is 'Asiatische Bamsse, oder Blutiges doch Mutiges Pegu' (1688), which continued to appear in successive editions as late as 1764. It was reprinted, under Felix Bohertag's supervision, from the third edition (1707), in Vol. 37 of Kurschner's 'Deutsche Nationalallitteratur.' The work is done in a turgid style, but met in its day a great success, and had in Germany considerable literary influence. Its author's further writings, historical and poetical, are of less significance.

Ziem, zém, Félix, French artist: b. Beaune (Côte d'Or) 25 Feb. 1821. He studied in the art school of Dijon, traveled in southern France, Italy, and the Orient, obtained a third-class medal at the Salon of 1851, a first-class in 1852, and became well known for his landscapes, particularly for scenes of Venice. Among his many canvases are: 'View of Venice' (1852; Luxembourg); 'The Bank of the Amstel' (Bordeaux Museum); 'Quai Saint-Jean at Marseilles' (Marseilles Museum); 'The Doge's Palace' (Ravené Gallery, Berlin); and several in private collections in the United States.

Zieriksee, zé'rik-zā, Netherlands, a town in the province of Zeeland, and the chief town of the island of Schouwen, three miles from the Ooster Schelde, with which it is connected by two canal harbors, and 21 miles east-northeast of Flushing. It has six churches, a fine town-house, and a gymnasium, manufactures madder, carries on brewing and oyster fishing, and has considerable trade and shipping. It is the oldest town of Zeeland, and was formerly an important Hanse town. Its demolished walls are now replaced by promenades. Pop. 7,000.

Ziethen, tsé'tén, or Zieten, Hans Joachim von, German soldier: b. Wustrau, near Neu-Ruppin, Brandenburg, 14 May 1699; d. Berlin 27 Jan. 1786. He entered the Prussian army in 1714, distinguished himself as a colonel in the Silesian campaign of 1742 and as a major-general in that of 1745, and in May 1745 made his celebrated march through the enemy's country in Upper Silesia, in order to communicate with the Margrave Karl at Jägerndorf. In 1756 he was made lieutenant-general. He obtained

his chief renown in the Seven Years' war, winning the victories of Reichenberg, Prague, and Leuthen, and deciding the day at Torgau by storming the heights of Suptitz. He was promoted general of cavalry, and was the most famous of the commanders of Frederick the Great. In the development of the light cavalry service he made important contributions. Consult the biographies by Count zur Lippe-Weissenfeld (2d ed. 1885) and by Winter (1886).

Zif, Ziv, or Ziph, in the Hebrew calendar, the second month of the year, extending from the new moon in May to that in June; or, according to some rabbis, from the new moon in April to that of June.

Zilleh, zél-lé', or Zile, ancient **Zela**, Asiatic Turkey, a town in the vilayet of Sivas, 25 miles southeast of Amasia. It is built on a hill, the mound of Semiramis mentioned by Strabo; a modern castle occupies the site of an old Byzantine fortress. Ancient Zela was a theocracy ruled by the priests of the temple of Anaitis. Pop. 20,000.

Ziller, tsil'lér, Tuiskon, German educator: b. Wasungen, Saxe-Meiningen, 22 Dec. 1817; d. Leipzig 20 April 1882. He was educated at Leipzig, where he was at first a lecturer in jurisprudence, but in 1864 became professor of philosophy and pedagogy. At his initiative the Verein für Wissenschaftliche Pädagogik was founded. Among his books are 'Einleitung in die Allgemeine Pädagogik' (1856; 2d ed 1901) and 'Allgemeine Philosophische Ethik' (1880; 2d ed. 1886).

Zillerthal, tsil'lér-tal, Austria, a valley of the Tyrol in the eastern Alps, about two miles below Innsbruck, famous for its scenic beauties. It is traversed by the Ziller, which joins the Inn River at the mouth of the valley. It is much frequented by tourists, a railway line connecting with Mairhofen in the valley.

Zimbabwe, zém-bal'wā, or Zimbabwe (Bantu for "here is a great kraal"), a name applied to numerous interesting South African ruins in Rhodesia and the Transvaal. The best known and most important is the Great Zimbabwe, near the Sabi River, about 17 miles from Victoria in southern Rhodesia. There are two principal structures at Great Zimbabwe, one on the crest of a granite hill breaking down precipitously to the south, and the other on the level ground about a third of a mile to the south. The lower one is roughly circular or elliptical, enclosed by a wall of 30 or 40 feet high, 14 feet thick at the base, and from 6 to 9 feet thick at the summit. The wall is composed of well-trimmed blocks of granite fitted together without mortar in regular courses, and occasionally set angularly for ornamental purposes. An inner wall runs close to the outer for a considerable distance, forming a passage which leads to a sacred enclosure containing two conical solid towers, the larger of which is some 30 feet high. The rest of the enclosure is divided into irregular chambers, none of which are roofed. The building on the hill is very strongly built for defense, and also contains a sacred enclosure. Phallic emblems, many curious objects in soapstone, and undoubted remains of gold-working utensils have been found in the Zimbabwes. The nearest gold deposits and ancient gold workings are, however, some

miles distant. Some theorists would locate here the Ophir of Solomon. It is generally believed that the lower building was a kind of town occupied by pre-Mohammedan Arabs who came here in search of gold, and that the ruin on the hill was a stronghold for defense. The buildings show distinct signs of orientation. Consult: Bent, 'The Ruined Cities of Mashonaland' (1892); and Hall and Neal, 'The Ancient Ruins of Rhodesia' (1902).

Zimmerman, Eugene, American caricaturist and illustrator: b. Basel, Switzerland, 25 May 1862. After a public school education in Paterson, N. J., and some time in various employments, he turned his attention to comic art, was on the staff of 'Puck' illustrators in 1882-5, and in 1885 became connected with 'Judge.' He also executed illustrations for some of the works of "Bill" Nye and others.

Zimmerman, Jeremiah, American clergyman and numismatist: b. Snickersburg, Md., 26 April 1848. Graduated from Pennsylvania College, Gettysburg, in 1873, and the theological seminary there in 1876, he was pastor of the Lutheran Church at Valatie, N. Y., in 1877-8, and in 1879 organized at Syracuse, N. Y., the First English Lutheran Church, of which he is still the pastor. He also became a lecturer in Syracuse University. He is regarded as an authority on the historical branch of numismatics. Among his writings is the volume 'Spain and her People' (1902).

Zimmermann, tsim'mër-man, Albert, German painter: b. Zittau, Saxony, 20 Sept. 1808; d. Munich 18 Oct. 1888. He studied in Dresden and Munich, and was made professor in the Milan Academy in 1857 and at the Vienna Academy in 1860. His works display admirable characterizations of mountainous scenery and excellent light-effects. Among them are: 'Rocky Landscape with Centaurs and Leopards'; 'Chiem Lake in Storm'; 'The High Goll'; 'Sunset on Hintersee'; and 'Lake Como.'

Zimmermann, Johann Georg, CHEVALIER VON, Swiss philosopher and writer: b. at Brugg, canton of Aargau (then in Bern), 8 Dec. 1728; d. Hanover 7 Oct. 1795. He studied medicine under Haller at Göttingen, and in 1754 was appointed public physician to his native town. He employed his leisure in the publication of pieces in prose and verse, including the first sketch of his popular work 'Ueber die Einsamkeit' (On Solitude, 1750; completely re-written 1784-5). This was followed by his essay 'Vom Nationalstolz' (On National Pride 1758). In 1763 he composed his work 'Von der Erfahrung in der Arzneikunst' (1764), which he followed up by several other professional treatises; in consequence of which he received an offer of the post of physician to the king of England for Hanover, which he accepted, and removed in 1768 to that capital. In 1786 he attended Frederick the Great in his last illness, which afforded little room for medical skill, but enabled him to publish an account of his conversations with that celebrated sovereign, 'Ueber Friedrich den Grossen und seine Unterredung mit ihm' (1788), and 'Fragmente über Friedrich den Grossen' (1789), works of no value. His 'Solitude' was at one time very popular, and was translated into almost every language of Europe.

Consult the studies by Bodemann (1878) and Ischer (1893).

Zimmermann, Wilhelm, German poet and historian: b. Stuttgart 2 Jan. 1807; d. Mergentheim, Württemberg, 22 Sept. 1878. After study at Tübingen, he was connected with various journals at Stuttgart, from 1847 to 1850 was professor of history and of German language and literature in the Polytechnic Institute there, but lost the post through his liberal attitude as a member of the German National Assembly (1848) and the Württemberg parliament. Subsequently he was pastor of Evangelical churches at Leonbrunn, Schnaithem, and Owen. He is best known for his 'Gedichte' (1831; 2d ed. 1839; 3d 1854), which reveal the influence of Schiller and Uhland, but are never merely imitative. Others of his publications are: 'Befreiungskämpfe der Deutschen gegen Napoleon' (1836; 3d ed. 1859); 'Geschichte des Grossen Bauernkriegs' (1841; 2d ed. 1856), and 'Geschichte der Deutschen Nationalliteratur' (1846).

Zim'mern, Helen, English authoress: b. Hamburg, Germany, 25 March 1846. After a secondary education at Bayswater, she became a contributor to 'Once a Week,' 'Old Merry's Monthly,' the *Press*, the *Examiner*, and other periodicals and journals, and in 1876 achieved a success with 'Schopenhauer, his Life and Philosophy.' From 1887 she has resided at Florence, Italy, where she corresponds for Italian, English, and American periodicals. She has also lectured in Italy, England, and Germany, on Italian art. Among her further publications are: 'Gotthold Ephraim Lessing, his Life and his Works' (1878); 'The Epic of Kings' (1882), a paraphrase from Firdusi; a 'Life of Maria Edgeworth' (1883); and 'The Hansa Towns' (1889). She also translated from Nietzsche, and Lessing's prose, and edited the comedies of Goldoni (1892).

Zimri, zim'ri, in the satire 'Absalom and Achitophel' (pt. i. 1681; pt. ii. 1682) by John Dryden (q.v.), a character representing Vilhers, Duke of Buckingham.

Some of the chiefs were princes in the land
In the front rank of these did Zimri stand, etc.
(Pt. i. 545 et seq.)

Buckingham was depicted as a factional leader, like Zimri who conspired against Asa, king of Judah (1 Kings xvi 9).

Zinc, or **Spelter**, a white metal with a bluish gray tint like lead. Its texture is lamellated and crystalline, and its specific gravity about 7. It is hard, being acted on by the file with difficulty, and its toughness is such as to require considerable force to break it when the mass is large. At low or high degrees of heat it is brittle, but between 250° and 300° F. it is both malleable and ductile, and may be rolled or hammered into sheets of considerable thinness and drawn into wire. Its malleability is considerably diminished by the impurities which the zinc of commerce contains. It fuses at 773° F., and when slowly cooled crystallizes in four- or six-sided prisms. Zinc undergoes little change by the action of air and moisture. When fused in open vessels it absorbs oxygen, and forms the white oxide called flowers of

ZINC WHITE—ZINZENDORF

zinc. Heated strongly in air it takes fire and burns with a beautiful white light, forming oxide of zinc. Zinc is found in considerable abundance in Great Britain, Austria, Germany, Belgium, Italy, and in some parts of the United States. It does not occur in the native state, but is obtained from its ores, which are chiefly the sulphide, or zinc-blende, and the carbonate, or calamine. The oxide of zinc (ZnO) is a fine white powder, insoluble in water, but very soluble in acids, which it neutralizes, being a powerful base of the same class as magnesia. It combines also with some of the alkalis. Several of the salts of zinc are employed in medicine and the arts; as the sulphate, which is used in calico printing, and in medicine as an astringent, a caustic, an emetic, and a tonic; the oxide and the carbonate, used as pigments, etc. Sheet-zinc is largely employed for lining water cisterns, baths, etc., for making spouts, pipes, for covering roofs, and several other architectural purposes. Plates of this metal are used as generators of electricity in voltaic batteries, etc. Zinc is much employed in the manufacture of brass and other alloys, and in preparing galvanized iron.

The centre of the zinc industry in the United States is at Joplin, Mo. (q.v.), where during 1903 the total shipment of zinc ore aggregated 210,857 tons, which sold at an average price of \$34 per ton, a total of \$7,407,225. The lead ore sales aggregated 26,519 tons, and sold at an average of \$54 per ton, a total of \$1,429,020. In 1901 the total production of zinc in the United States aggregated but 140,000 tons, which figures show a remarkable increase in the output of the Joplin district. Promising zinc mines were opened in Wisconsin in 1903 and no less than 20 mills were erected in that State in the year named.

Zinc White. See WHITE COLORS.

Zincite, a deep blood-red to orange-red mineral found quite abundantly in Sussex County, New Jersey. It is usually in granular or foliated masses, associated with franklinite, will-emite, tephroite, and calcite. It rarely occurs in hexagonal, hemimorphic crystals, with perfect basal cleavage. Its hardness is 4 to 4.5 and specific gravity about 5.7. It is an oxide of zinc, ZnO, and is valuable as an ore of that metal. It is often called "red oxide of zinc."

Zincography. See LITHOGRAPHY.

Zingarelli, dzën-ga-rë'l'ë, **Nicolo Antonio,** Italian composer: b. Naples 4 April 1752; d. there 5 May 1837. He studied at the Conservatorio di Loreto and also under the Abbate Speranza, and on leaving the conservatory received the place of master of the chapel at Torre dell' Annunziata. In 1781 he composed for the Theatre San Carlos, in Naples, his opera 'Montezuma,' and in 1785 brought forward his 'Alzinda' in La Scala, Milan, with great success. In this work he adopted a more simple and easy style. His best operas are 'Pirro,' 'Artaserse,' and 'Romeo e Giulietta.' In 1789 he brought out his 'Antigone,' from Marmontel, in Paris; but the public events then occurring absorbed the attention of the public, and he soon returned to Italy, where he became director of the Vatican chapel. About 1812 he was appointed director of the musical academy of San Sebastiano, and in 1816 chapel-master in St. Peter's. Zingar-

elli composed much church music, and his works are highly esteemed for their expression. From 1781 he wrote about 40 operas, many melodies from which have continued to be interpolated in modern Italian productions.

Zingerle (von Sommersberg), tsing'er-lë, **Ignaz Vincenz,** Austrian Teutonic scholar: b. Meran 6 June 1825; d. Innsbruck 17 Sept. 1892. He was a nephew of Pius (q.v.). He studied at Innsbruck and (theology) Brixen, and from 1859 until his retirement in 1890 was professor of German language and literature at Innsbruck. Among his works are: 'Sagen aus Tirol' (2d ed. 1891); 'Sitten, Bräuche, und Meinungen des Tiroler Volkes' (2d ed. 1871); 'Schildereien aus Tirol' (1875-88); and 'Der Bauer von Longvill' (1874).

Zingerle, Pius, Austrian Orientalist and Catholic theologian: b. Meran 17 March 1801; d. Marienberg cloister 10 Jan. 1881. He studied at Innsbruck, became in 1862 professor of Oriental languages in the Sapienza at Rome, and in 1867-71 was director of the gymnasium at Meran. Among his works are: 'Ausgewählte Schriften des Heiligen Kirchenvaters Ephräm' (2d ed. 1845-6); 'Akten der Heiligen Martyrer des Morgenlandes' (1836); 'Chrestomathia Syriaca' (1871); and 'Lexicon Syriacum'.

Zinjan, zín-jän', Persia. See ZENJUN.

Zin'nia, a genus of annual and perennial herbs and sub-shrubby plants of the order *Compositæ*. The species, of which 16 have been described, are indigenous from southern Colorado to Chile, but are chiefly distributed in Mexico and Central America. They have opposite generally entire leaves and terminal heads of very variously tinted flowers, for which some of the species have become popular in gardens. The best known species is the garden zinnia or youth-and-old-age (*Z. elegans*), an erect annual usually about 18 inches tall and originally bearing yellow or orange flowers, but now exhibiting nearly every tint except blue and green in both single and double forms, which often exceed three inches in diameter. *Z. haageana* was introduced into cultivation in 1861, but being less showy and smaller than the former is of secondary importance. A hybrid race developed from these two species, and known as *Z. darwini*, has been developed, but has not become widely popular in America. The plants are rather stiff, formal, and coarse in habit, and their colors, although brilliant and metallic, lack the delicacy of the dahlia and the china aster, to which they are not distantly related. They are, however, among the most useful garden annuals, because they will thrive upon almost any kind of soil and yield a profusion of bloom from midsummer until frost. They are readily propagated by means of seed sown in the open air, or for earlier bloom under glass, the seedlings being transplanted to permanent quarters at distances of from one to two feet, according to the size the variety generally attains. Except the usual clean cultivation of the soil until the plants shade the ground, no special care is required. Sunny situations are most satisfactory.

Zinzendorf, tsín'tsën-dôrf, **Nicholas Ludwig,** COUNT VON, German religious leader, founder of the Society of United Brethren: b. Dresden, Saxony, 26 May 1700; d. Herrnhut,

Upper Lusatia, 9 May 1760. From 1716 to 1719 he studied at the orthodox University of Wittenberg, and subsequently traveled in Holland and France, describing his journey in 'The Pilgrimage of Atticus through the World.' In 1721 he received an appointment to the council of state from the Saxon government, which he held till 1727. He then completely withdrew from public affairs. He received at his estate in Upper Lusatia (1722) the persecuted Moravian Brethren. This settlement received in 1724 the name of Herrnhut. With a view to founding the body called the United Brethren (q.v.), he published various projects, not in harmony with each other, which excited opposition, but he persevered in his plan and finally succeeded. In 1734, after passing a theological examination under an assumed name, he was ordained a clergyman of the Lutheran Church. After two years spent in traveling on behalf of his society, he was banished in 1736 from Saxony. The order of his banishment was repealed in 1747. In the meantime he had been consecrated bishop of the Moravian Church in Berlin, founded Moravian colonies in Holland, Esthonia, and Livonia, and visited England. In 1739 he wrote a catechism which he styled the 'Good Word of the Lord,' and the same year visited the missions of the Brethren in the West Indies. In 1741 he founded the well-known Moravian colony at Bethlehem, Pa., and before returning to Germany in 1743 assisted in establishing missions among the Indian tribes. After returning to Europe he made a journey to Livonia, whence the Russian government sent him back under a military escort to the frontier. He afterward visited Holland, spent several years in England, and obtained an act of Parliament for the protection of his followers in the British dominions. He wrote more than 100 works of prose and verse. A collection of his hymns, edited by Knapp, appeared in 1845. Consult the 'Lives' by Spangenberg (1773-5; Eng. trans., abridged, 1838) and Römer (1900); also, Plitt, 'Zinzendorf's Theologie' (1869-74), and Becker, 'Zinzendorf und sein Christentum im Verhältnis zum Kirchlichen und Religiösen Leben seiner Zeit' (2d ed (1900),

Zi'on, or **Sion**, the loftiest mount of Jerusalem, and often used to designate the whole city, and metaphorically the kingdom of God on earth and in heaven. Zion rises about 2,500 feet above the Mediterranean, and from 200 to 300 feet above the valleys at its base. It was separated from Akra on the north and Moriah on the northwest by the Valley Tyropeon; and had the valley of Gibbon on the west, that of Hinnom on the south, and that of the Kidron on the southeast. It was a fortified town of the Jebusites till subdued by David, and thenceforward was called the "City of David." A mosque near its southern brow now covers the "tomb of David" so called. This mount, together with Moriah and Ophel, was enclosed by the first wall, and fortified by citadels. On it were erected the palaces of Solomon, and long afterward those of Herod. At the present day a considerable portion of it lies outside of the modern wall on the south.

Zi'onism, a name given to a scheme for the acquisition of Palestine by purchase from Turkey, with a view to establishing Russian and other Jews in the Holy Land. A Zionist

Congress with this end in view opened at Basel 29 Aug. 1897; and again 28 Aug. 1898. About 200 European delegates were present. The financial instrument of the Zionists is the Jewish Colonial Trust, Ltd., of London, capitalized at \$10,000,000, of which \$1,400,000 has been paid in. In the United States the Zionist organization is called the Federation of American Zionists, and has 165 affiliated societies, comprising a membership of approximately 10,000.

Zipaquira, sē-pa-kē-rā', Colombia, town, department of Cundamarca, 25 miles north of Bogotá. It is built on the site of an old Chibcha Indian town, which was the residence of the chiefs or *Zipas*. It is especially noted for its valuable salt bed which is owned and operated by the government, and supplies the greater part of the salt used in the republic. Coal and iron are also found in the vicinity; and the town carries on an active trade with the surrounding district. Pop. (1903) 12,000.

Ziph. See **Zif**.

Zir'con, the native zirconium silicate, $ZrSiO_4$. Its crystals are tetragonal and isomorphous with thorite, xenotime, cassiterite, and rutile. Though its crystal forms are very varied, they are usually prisms terminated by pyramids, the base being rare. Small crystals frequently show a wealth of faces, among which the "zirconoids" or ditetragonal pyramids are prominent. It is a heavy mineral, its specific gravity averaging about 4.7, and it has a characteristic greasy-adamantine lustre. Though often nearly or quite opaque, transparent crystals are not uncommon, and owing to its hardness, 7.5, strong double refraction and the variety of rich colors in which it is found, zircon has long been prized as a gem. Its dispersive power is excelled only by the diamond. "Hyacinth" or "jacinth" includes reddish, orange, or brownish gem stones, while "jargon" embraces the colorless, yellowish, grayish, or smoky varieties. It is often an important accessory constituent of gneiss, syenite and many crystalline rocks. Because of its resistance to weathering and abrasion it frequently occurs in fine little crystals in alluvial sands as in Ceylon, Brazil, and the monazite region of North Carolina. The finest zircon gems come from Ceylon and New South Wales, while France yields very small stones of remarkably fine red color. Excellent translucent to opaque crystals occur in Norway, the Ural Mountains, Canada (up to 15 pounds), in New York, New Jersey, Colorado, and North Carolina. By far the most important locality is in Henderson County, North Carolina, where many tons of crystals occur loose in the soil. Zirconia, derived from this source, was used in the "Welsbach" or "Auer" mantles, but its incandescence had not sufficient permanency and its use has been superseded by thoria. Zirconia is still useful as a refractory material in furnace and crucible linings, and because of its incandescence in the "zircon light," which is an improvement on the ordinary lime light.

Zirconium, a chemical element named after the mineral zircon in which Klaproth discovered the oxide zirconia (1789). Afterward found in many other minerals, some of the most important being eudialyte, hyacinth, polymignite, etc. It has many physical and chem-

refused to recognize his authority, and he thoroughly subdued it in 1424. In that year, it is said, Sigismund, realizing the impossibility of conquering Bohemia, began negotiations toward a treaty, by the terms of which the Hussites were to have full religious liberty and Ziska was to be governor of Bohemia. Such negotiations, if undertaken, were interrupted by Ziska's death at the siege of Pířyslav. Ziska became the hero of the Bohemian revolutionary party, and for this character he was well fitted by his zeal and military ability. He was frequently cruel in his method of warfare and conquest. Much fiction has been mingled with the facts of his career. Alfred Meissner's epic 'Ziska,' based on the leader's history, reached a 12th edition in 1884. Consult the German translation (1882) of Tomek's 'Life.'

Zith'er, a modern development of the musical instrument known to the Greeks as cithara. In the early part of the 19th century it became a favorite with the peasantry of the Styrian and Bavarian Alps, and was introduced into England about 1850. The zither consists of a resonance box, with a large circular sound hole near the middle; the strings, 32 in number, in some cases increased to 40 and even 46, being made of steel, brass, catgut, and silk covered with fine silver or copper wire, and tuned by pegs at one end. Five of the strings are stretched over a fretted keyboard, and are used to play the melody, the fingers of the left hand stopping the strings on the frets, the right-hand thumb, armed with a metal ring, striking the strings, which are tuned in fifths, and have a chromatic range from C in the second space of the bass staff to D in the sixth ledger line above the treble. The remainder, called the accompaniment strings, are struck by the first three fingers of the right hand. The viola zither, in which the resonance box is heart-shaped, is tuned like the violin, and is played with a bow.

Zittau, tsít'tow, Germany, a town of Saxony, on the Mandau, near the Austrian frontier, 40 miles by rail east-southeast of Dresden. The chief public buildings are a splendid town-house, the churches of Saint Peter and Saint Paul, Saint John, and Mary, hospitals, custom-house, gymnasium, a municipal museum, and a valuable library. Its principal manufactures are cotton-spinning, dress goods, iron-founding, machinery, stained glass, cycles, ropes, paper, brewing, and brick-making; and there is a trade in cotton and linen goods, chemicals, etc. There are a number of lignite mines in the neighborhood. Pop. (1900) 30,921.

Zittel, tsít'tél, **Karl Alfred von**, German paleontologist and geologist; b. Bahlhngen, Baden, 25 Sept. 1830. After study at Heidelberg and Paris, he became connected with the department of geological survey at Vienna, in 1863 a lecturer in the university there, and in the same year professor of mineralogy at Karlsruhe. In 1866 he was made professor of paleontology and geology at Munich; and in 1899 president of the Bavarian Academy of Sciences and curator-general of the scientific collections of Bavaria. The Rohlf's expedition to Egypt and the Libyan desert in 1873-4 derived much of its value from his important labors. Among

his publications are the 'Paläontologische Studien über die Grenzschiehten der Jura- und Kreideformation' (1868-83); 'Aus der Urzeit' (1872; 2d ed. 1875); 'Handbuch der Paläontologie' (with Schimper and Schenk 1876-93), the most complete and authoritative work in that field; and 'Geschichte der Geologie und Paläontologie bis Ende des neunzehnten Jahrhunderts' (1899). He edits the periodical 'Paläontographica.'

Ziwet, **Alexander**, American mathematician; b. Breslau, Germany, 8 Feb. 1853. Graduated from the Polytechnical School of Karlsruhe in 1880, he came in that year to the United States, and for some time was connected with the United States lake survey (Detroit) and the coast and geodetic survey (Washington). Subsequently he became successively instructor in, and junior professor of, mathematics in the University of Michigan. In 1892 he was made co-editor of the 'Bulletin' of the American Mathematical Society. He published an 'Elementary Treatise on Theoretical Mechanics' in three parts, as follows: Pt. I., 'Kinematics' (1893); Pt. II., 'Introduction to Dynamics, Statics' (1893); Pt. III., 'Kinetics' (1894).

Ziza'nia, a genus of grasses (q.v.) including the wild rice.

Ziz'yphus, a genus of *Rhamnaceæ*, shrubs or small trees, with spiny stipules, alternate three-nerved leaves, a spreading five-cleft calyx, five hood-like petals, five stamens, a five-angled disk, adhering to the tube of the calyx, and having enclosed within it the two- or three-celled ovary. Fruit a drupe, which is sometimes edible and has a large stone or kernel containing from one to several flattened seeds. *Zizyphus* is widely distributed, but is chiefly indigenous to tropical Asia and America. The fruits of the cultivated *Z. jujuba*, and of *Z. sativa*, are of the size and shape of a small, oval plum. They ripen in September when they are gathered and stored in a dry place, the pulp becoming sweeter by the process. They have a dark-red skin, but are yellow within. If carefully dried, these fruits, called jujubes, will keep for a long time, and retain their acid flavor, which has made them a refreshing dessert fruit, in the Mediterranean countries and in China. They are nutritive and demulcent, a cough medicine having been prepared from them, and formerly, the sweet meat known as jujube paste, was made from the evaporated juice of jujube, and of gum-arabic; but now the jujube is displaced by the gum and by gelatine. *Z. sativa* is a handsome arborescent shrub, with small, varnished, oval leaves and greenish inconspicuous flowers, succeeded by the bright drupes. It is sometimes cultivated in the United States, being hardy as far north as Washington. The bark, in its native countries, was used medicinally, for fever and for sores; and it is also employed for tanning and for a dye-stuff like that of *Z. xylopyra* which yields a black dye. Various parts of other species yield medicines, and the edible fruits of *Z. baeli* of Africa are used for a pleasant drink and are also made into bread. *Z. lotus* is by some believed to be the lotus-trees the fruit of which produced such indolence in those who ate them. It grows in Barbary, where it is called *sadr*. *Z. spina-*

ZLATOUST — ZOAR

christi is a small, prickly tree, which is reputed to have composed Christ's crown of thorns. Like other spiny species of *Zizyphus*, this is a good hedge plant. *Z. nummularia* of Persia and India is one of the camel's thorns, whose foliage forms a fodder, and which has edible fruits. The cog-wood of Jamaica, an important timber tree, is *Z. chloroxylon*.

Zlatoust, zlä-tō-oost', Russia, a town in the province of Ufa, on the Ai, an affluent of the Ufa, near the Ural Mountains, 150 miles northeast of Ufa. In the vicinity are rich iron and gold mines, and in the town are government works, manufacturing sword-blades, steel instruments, and ammunition. Pop. (1897) 20,973.

Znaim, tsnīm, Austria, a town of Moravia, on the Thaya, 50 miles northwest of Vienna. The chief buildings are a Rathhaus (1446), a circular church, said to have been a heathen temple, and the Gothic church of Saint Nicholas. The old ducal castle crowns a neighboring height. The trade is largely agricultural. Mustard, wine, and cucumbers are exported. Fine majolica, leather, and chocolate are manufactured. New waterworks were opened in 1877. As Znoim, it was the capital of Moravia, destroyed in 1145 by the Bohemian Prince Vladislav, and rebuilt in 1226. On 11 July 1809, the French under Massena and Marmont defeated the Austrians here, and in 1866 it was captured by the Prussians. Pop. (1900) 16,261.

Zoar, zō'ar, **Separatist Society of**. The Separatist Society of Zoar was a communistic religious organization located at Zoar, on the Tuscarawas River, Tuscarawas County, Ohio. They were German Protestant peasants, 225 in number, who emigrated from Wurtemberg in April 1817. Their chosen leader was Joseph Baumler, whose name was later changed, for the sake of euphony, to Bimeler. Bimeler was of humble origin, but a man of unusual ability and independence, well educated, a natural leader, and a fluent speaker; he purchased in his own name, in the locality named above, 5,000 acres of farm land, at an average value of \$3 per acre, giving a mortgage at long time for the entire amount. This Separatist emigration had been primarily, for the purpose of securing religious liberty; and, for better opportunities in obtaining a livelihood. It was expected that each family would, by its industrious labor, secure separate ownership in a portion of the land held by Bimeler, but the colonists being diverse in age, strength, experience, education, and enterprise, they soon realized that their personal inequality stood in the way of the collective success of the colony, and early in 1819 they decided to organize into a community of property and effort. Articles of agreement were signed by 159 adults — 53 males and 104 females. The articles created a community of interest, present and prospective, whereby all the property, movable and immovable, of the individual members, and their future earnings should become the common stock of the association, to be held and managed by chosen directors. Death of a member passed no property interest to his heirs, and withdrawal from the society, voluntary or compulsory, carried with it no claim upon a divided or undivided right in the association. Bimeler was to retain the realty in trust

until the society by its earnings could pay the mortgage and assume title.

In 1832 the society was incorporated under the then existing laws of Ohio by the name of "The Society of Separatists of Zoar." This conferred upon the society the ordinary powers of a corporation, with perpetual succession, power to hold property, purchase and sell, pass by-laws, etc. Under this reorganization the members were divided into two classes, known as the novitiates and the full associates; the novitiates were obliged to serve at least one year before admission to the second class, and this applied to the children of the members if, on becoming of age, they wished to join the society; the full associates must be of legal age — the males 21 and the females 18; all officers were elected by the whole society, the women voting as well as the men, all elections being by ballot and a majority vote; the government of the community vested solely in a board of three trustees (or directors) to serve three years each, one to be elected annually; these trustees had unlimited power over the custody and management of the property and all the temporalities of the society, but were bound to provide clothing, board and dwelling for each member "without respect to person," and use all means confided to their charge for the best interests of the society; they directed the industries and detail of affairs of the society; assigned each member his especial work, and the portion of necessities each should receive. Beside the board of trustees there was a standing committee, or council, of five, one member being elected each year. This council was the supreme judiciary, or board of arbitration, of the society, in cases of disagreement, dissension, or complaint; it had power to excommunicate members or deprive them of participation in the affairs of the society. They also elected once in four years a cashier or treasurer who had custody of all moneys, kept the books, and had immediate oversight over the finances of the society. In addition there was an official known as the "agent general," who acted as the trader to buy and sell for the society in its dealings with the outside world, make and enforce contracts, etc. The office of agent general was regarded as the position of honor and influence, and to it Joseph Bimeler was elected for life; after his death the office remained vacant, its duties being performed by the cashier or the trustees.

The society, from its organization as a commune, steadily prospered, and in time built up a large number of enterprising and successful industries, having in the period of its height two large flour mills, saw mill, planing mill, machine shop, tannery, dye house, stove foundry, cooper shop, woolen mill, brewery, slaughter house, blacksmith shop, tile works, pottery, etc. In all these concerns a high grade of goods was produced, which found a ready market with foreign customers. The value of the Zoar property increased until about 1875, when their land, industrial plants, and money accumulation were estimated at \$1,500,000. From that time the enterprise began to decline. Bimeler died in 1853, and there was no leader or director his equal in sagacity or personality. The environment of the society slowly changed from that of a western pioneer frontier to a prosperous, cultivated section of country, and rival neighboring in-

dustries made inroads into the export business of Zoar; the Zoarites were not progressive and did not keep pace in their manufactures with modern methods and improvements, and in time found that they could purchase products for use and wear cheaper than they could make them; there were few accessions to the society; the original members became too old and feeble to conduct its affairs; outside laborers had to be employed; the younger members were inclined to leave and seek their fortunes where they could acquire independent property and freedom of action. This decline continued until in 1897, when, by a common consent, the organization decided to disband and place the property in the hands of a commission for equal division. The appraisement and distribution was completed in the fall of 1898. There were at this time 222 people, adults and children, in the society, of whom 136 were entitled to one equal share. They each received a few hundred dollars in cash and a portion of the farm land or village property.

The religious tenets of the Zoarites were few and simple. They confessed the doctrine of the Trinity; the fall of man; the return through Christ; the Holy Scriptures as the guide of their lives; all ceremonies were declared useless and injurious; marriages were contracted by mutual consent and before witnesses; they recognized no ordained minister, and engaged in no public prayer. Bimeler was their only preacher and teacher; he spoke each Sunday to the society, and after his death his published discourses were read in the public meetings by various members. The society did not seek additions and made no attempt to propagate its principles, either economic or religious. The life of the Zoarites was one of utmost simplicity, serenity and morality. There never was a divorce in the community and no member was ever charged with a crime or felony. Consult: Randall, 'History Zoar Society,' and Nordhoff, 'Communitistic Societies in U. S.'

E. O. RANDALL, PH.D.,

Secretary of the Ohio State Archaeological and Historical Society.

Zöckler, tseck'lër, Otto, German Lutheran theologian: b. Grunberg, Hesse, 27 May 1833. He was educated in the universities of Giessen, Erlangen, and Berlin, became a lecturer at the first-named in 1857, and in 1863 professor of theology. In 1866 he was appointed professor at Greifswald, and in 1885 consistorial councillor. He is one of the leaders of the movement toward the establishment of a state church in Prussia. In 1882 he became editor of the 'Evangelische Kirchenzeitung.' Among his works are: 'Hieronymus, sein Leben und Wirken' (1865); commentaries to Chronicles, Job, Proverbs, Ecclesiastes, Canticles, and Daniel, in Lange's 'Bibelwerk' (1866-72; Eng. trans. 1870 et seq.); 'Das Kreuz Christi' (1875; Eng. trans. 1877); 'Gottes Zeugen im Reich der Natur' (1881; Eng. trans. 1886); and 'Biblische und Kirchenhistorische Studien' (1893). For the 'Kurzgefasstes Kommentar zum Alten und Neuen Testament und zu den Apokryphen' (1886 et seq.), which he edited with Strack, he prepared the commentaries on the Old Testament apocryphal books, the Acts, and the epistles to the Thessalonians and Galatians.

Zo'diac. The zodiac is a belt of the celestial sphere, extending 8° on each side of the ecliptic, or the path of the sun among the stars. "The name is derived from ζῳόν, a living creature, because the constellations in it (except Libra), are all figures of animals. It was taken of that particular width by the ancients simply because the moon and the then known planets never go farther than 8° from the ecliptic" (Young's 'Astronomy'). The belt is divided into 12 parts, of 30° each, to which are given the following names: Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, Pisces. This division into 12 parts was suggested by the 12 re-appearances of the moon in a year. The idea seems to have originated with the Chaldean astronomers.

Owing to the fact that the earth is not a perfect sphere, the pole of the earth's equator describes a circle around the pole of the ecliptic, which causes a constant retrograde motion in equator with the point of intersection of the plane of the zodiac. The rate of this motion is 1° in 70 years, and has amounted to 30°, or one entire sign, up to the present time. "The sign of Aries, therefore, is now in the position of the constellation Pisces; each sign having backed so to speak into the constellation west of it." The constellations themselves bear no resemblance to the signs designated by them.

During the Middle Ages the signs of the zodiac were supposed to influence human life, and hence were distributed to different parts of the human body. Disease was supposed to be cured by the aid of the zodiacal power presiding over that part of the body. The remnant of this superstition is still seen in some almanacs.

The Egyptians are supposed to have adopted the 12-fold division of the Zodiac from the Greeks, but they changed the symbols of living creatures to others of their own. The Chinese divided the course of the sun into 12 parts, which they designated as the Rat, the Ox, the Tiger, Hare, Dragon, Serpent, Horse, Sheep, Monkey, Hen, Dog, and Pig. This division is still found in some parts of Central Asia, and Japan. It has also been found among the remains of the Aztec race in America. The original zodiacal constellations occupied unequal spaces in the heavens. Hipparchus was the first to divide the zodiac into equal spaces of 30° each, and give to them the names of the older constellations. His method of reckoning positions in the ecliptic was used until this century. Astronomers have now abandoned it for the more accurate measurement of degrees, beginning at the vernal equinox.

The origin of the names of the animals assigned to the zodiac by the ancients is unknown. Some have supposed that the spring signs: Aries, the Ram, Taurus, the Bull, and Gemini, the Twins, mark the time of the bringing forth of young by flocks and herds. Cancer, the Crab, marks the time when the sun appears to move backward. Leo, the Lion, symbolizes the fierce heat of summer, and Virgo, the Virgin, glean-ing corn, symbolizes the harvest. In Libra, the Balance, the day and night balance each other. Scorpius is supposed to have marked the presence of venomous reptiles in October; while Sagittarius symbolizes the season of hunting.

ZODIACAL LIGHT — ZOHAR

Capricornus marks the beginning of the return of the sun to the north, Aquarius symbolizes the winter rains, and Pisces the season of fishes. These are but fanciful representations, and have no foundation in fact.

Zodiacal Light. "The zodiacal light is a faint column of light rising from the western horizon after twilight in winter or spring evenings; and before daybreak in summer or autumn. It extends out on each side of the sun, and lies nearly in the plane of the ecliptic. Near the equator it can be seen all the year, and has been traced all the way across the heavens from east to west, forming a complete ring." In our latitudes it can seldom be traced more than 90° from the sun. Parts of the column near the sun are somewhat bright, but distant portions are extremely faint, and can only be seen on the very clearest nights. The cause of the zodiacal light is not definitely known. The theory most generally received is that it is sunlight reflected by myriads of small meteoric bodies revolving around the sun, nearly in the plane of the ecliptic. This theory would require a thin flat ring of these meteors to extend beyond the orbit of the earth. The theory is not established. The name zodiacal light was given to this phenomenon by Cassini in 1653, who described it as a flat luminous ring encircling the sun nearly in the plane of the ecliptic. Kepler supposed it to be the atmosphere of the sun; but Laplace showed that the atmosphere of the sun could not extend to anything like the distance from the sun which is reached by the zodiacal light. In 1853 an extended series of observations was made by Jones from different parts of the Pacific ocean. From these observations he deduced the theory that the zodiacal light was caused by a ring of matter surrounding the earth, and not the sun.

Professor Wright, of Yale University, has determined that the spectrum of the light is continuous, and therefore is essentially reflected sunlight. He has also determined that the light is partially polarized in a plane passing through the sun, and that the amount of the polarization is between 15 and 20 per cent. The origin of the minute particles which reflect the light has been accounted for in many ways. By some they are believed to have been thrown out from the corona of the sun; by others to be composed of dust thrown out from the equatorial regions of the sun; but by most they are believed to be an immense cloud of meteoroids filling the space between the earth and the sun. The meteoric theory of the sun's heat presupposes a multitude of these meteoric bodies constantly falling into the sun to supply the loss by radiation, as well as multitudes of others which never reach the surface. It is not probable, however, that these meteors if they exist play any part in the phenomena of the zodiacal light.

Zoë, זֹהַי (Gr. Ζωή), empress of the East: b. about 978; d. 1050. She was the daughter of Constantine IX., and became the wife of Romanus III. in 1028. She became the murderess of her husband, in order to place Michael IV. on the throne. The latter dying, was succeeded by his nephew, Michael V., who was deposed by the people. Zoë and her sister Theodora were then proclaimed joint sovereigns. She displayed

great ability and firmness in the government, and in 1042 married Constantine IX., Monomachus. She reigned till her death.

Zo'etrope, a modern mechanical toy, depending, for its interest on the constancy of visual impressions. It consists of a rotating drum, open at the top, in which around its inner periphery are placed strips of paper, having figures of men, animals, etc., in varying positions. By turning the cylinder the images are seen through slots in its upper side, giving the effect of action to the figures.

Zoffany, tsöf'fä-ni (properly **Zaufelby**), Johann, German painter. b. Ratisbon 1733; d. London 11 Nov. 1810. He was a pupil of Speer at Ratisbon, studied also for 12 years in Italy, in 1758 went to England, there first attracted attention by a portrait of Garrick, and soon won considerable reputation. He was sent by George III. to Italy, where he executed 'The Tribune of Florence,' one of his most celebrated works. In 1783 he went to India, where he was very successful in his art. Among his further paintings are: 'Earl of Barrymore'; 'Foote'; 'Weston'; 'Members of the Royal Academy'; 'Tiger Hunt'; and 'Embassy of Hyder Beg.'

Zog'baum, Rufus Fairchild, American artist: b. Charleston, S. C., 28 Aug. 1849. He studied at the Art Students' League (1878-9) and in Paris with Leon Bonnat (1880-2), made extensive study of European armies in field and garrison, and later became known as a leading delineator of military and naval subjects, which he renders with scrupulous fidelity to the various points of detail. His publications, written and illustrated by himself, are: 'Horse, Foot, and Dragoon' (1887); 'All Hands'; and 'Ships and Sailors.'

Zohar, zō'har, the Bible of the Kabbalists, long revered by Jewish mystics and regarded by some as higher than the Bible and the Talmud, has, however, been proved a clever forgery. The secret science of the Kabbala received a marked development at the beginning of the 13th century, when a mystic, Ezra or Azriel, compiled a work called 'Brilliance' ('Bahir') (1240). In an atmosphere of reputed miracles and a new Messiah, there appeared some years later the most famous Kabbalistic book of the time—the 'Zohar,' or 'Splendor.' It was offered as the work of Simon ben Jochai, a sage of the 2d century, of whom many legends are told. He is said to have spent years in solitude, a hermit receiving special revelations. It was claimed that for over a thousand years the 'Zohar' had been concealed in a cave in Galilee and had been at last brought to light. The literary forger who "discovered" the 'Zohar' was Moses of Leon (born in Leon about 1250, died in Arevalo 1305), who employed an Aramaic idiom to give the book an air of antiquity, and with such skill that Jew and Christian alike were deceived and some even to-day attribute to it hoary age. Yet his widow admitted that it was a forgery.

The character of the 'Zohar' can hardly be dismissed as unique in literature, with its fantastic, imaginative, and emotional elements. It is a medley of spirituality and coarseness, a strange combination of intellectuality and gross-

ness, whose influence has been far-reaching and whose adherents have numbered hundreds of thousands. It is a work without method, a kind of impressionist commentary on the Pentateuch, half homily, half meditation, dwelling largely on the "higher" sense of Scripture and allowing every opportunity for vague and mystic interpretation. Hence the moral perversions that abound, the blasphemy and absurdity. The pre-existence of the soul is assumed—paradise and hell are alike depicted, the varieties of sin described with painful minuteness, Messianic speculations indulged in, and views favorable to the dogma of the Trinity uttered, while communion with departed spirits, celestial hosts, and angels completes the farrago of nonsensical speculation. Such an aberration is rare in the history of Judaism and has been productive of much harm. Its soil has nourished gross superstitions and strengthened the belief in ghosts and evil spirits; its mode of interpretation has degraded the study of the Bible and spread the wildest fancies. At one time it was high in favor with the papacy when the Talmud was condemned to the flames, but it was later included in the Index Expurgatorius. Its occasional Christian tone was not overlooked by Christian scholars—Pico di Mirandola (1403-94) and Reuchlin (1455-1522) both made the 'Zohar' the basis of their vindication of Jewish literature. Its literary influence, however, was not long retained. It developed a few "saints" and "miracle workers," spurious Messiahs and the like, but it has had no successor. In absorbing the miasma of the earlier Kabbalistic literature, it left no germs for further development. See JEWS AND JUDAISM.

Bibliography.—Graetz's 'History of the Jews,' Vols. III. and IV.; Abrahams' 'Jewish Literature,' pp. 172-5.

Zoïlus, zō'i-lūs (Gr. Ζωΐλος), Thracian rhetorician, chiefly remembered for the asperity of his criticisms on the poems of Homer. An account of his career is given by Vitruvius, which is not self-consistent, and the time at which he lived is uncertain. He is said to have been a pupil of Polycrates, to have been eminent before the rise of Socrates, and to have continued to write until the reign of Alexander. Vitruvius represents him as seeking the patronage of Ptolemy Philadelphus. Heraclides says he was originally a Thracian slave. He is reported to have died a violent death. The violence of his attacks on Homer procured him the title of *Homocromastix*. He also attacked Plato and Isocrates. It is said he found fault with Homer principally for introducing fabulous and incredible stories into his poems. He has acquired the reputation of having been a captious and unjust critic, but Dionysius of Halicarnassus places him in the highest rank. Consult Spindler, 'De Zoïlo' (1888-9).

Zoisite, a mineral closely related to epidote. It is a basic ortho-silicate of calcium and aluminum, $\text{HCa}_2\text{Al}_2\text{Si}_2\text{O}_{10}$. The aluminum is sometimes partly replaced by iron, the mineral thus approaching epidote in composition. Though its crystals are orthorhombic, their form is very similar to the monocline epidote. Its hardness is 6 to 6.5 and specific gravity about 3.3. Its color is usually dull gray or

brown, but in the variety "~~thulite~~," found in Norway, it is a beautiful rose pink. It is found in many European localities, also abundantly in the New England States, Pennsylvania, and North Carolina, and in exceptionally good crystals at Ducktown, Tenn.

Zola, zō'la, fr. zō-la, **Emile**, French novelist: b. Paris 2 April 1840; d. there 29 Sept. 1902. He was educated at the College of Aix, from which he went to the Lycée St. Louis at Paris with a scholarship in 1858. His career there was undistinguished, and he left in 1860 after failing to take his degree owing to insufficiency in literature. After a very brief experience as a clerk in a business house he was for more than a year compelled to sound the lowest depths of poverty in Paris, but in 1861 he obtained employment as a shopman with MM Hachette, the publishers, at a salary of a pound a week. He devoted his spare time to literary work, contributing short stories to the 'Petit Journal' and 'La Vie Parisienne,' and critical articles to the 'Salut Public' of Lyons and afterwards to Villemessant's journals, the 'Evénement' and the 'Figaro.' Several of his stories were published separately in the volumes 'Contes à Ninon' (1864), which contains some of his best and purest work, and which was followed in 1874 by 'Nouveaux Contes à Ninon.' Some of his critical articles were collected under the title 'Mes Haines' (1866). In 'La Confession de Claude' (1865), a novel in which he utilized his early struggles, we find him already in full progress toward the characteristic work of his maturity, and this tendency became still more marked in the immediately succeeding novels: 'Le Vœu d'une Morte' (1866); 'Les Mystères de Marseille' (1867); 'Thérèse Raquin' (1867), a powerful study of the effects of remorse following on adultery and murder; and 'Madeleine Féral' (1868). Having by this time gained a secure footing in the world of letters, he conceived the plan of the series of novels known as 'Les Rougon-Macquart,' which includes his best-known work and occupied him for nearly a quarter of a century. It is described as an 'histoire naturelle et sociale d'une famille sous le second empire,' and consists of 20 works dealing with different phases of modern life, not always strictly that of the Second Empire, but rather that of the Third Republic. The particular departments of life treated in the volumes were studied by Zola in the spirit of a scientific observer, but of one with a decided bias toward the portrayal of moral filth and disease; and the bond of connection which constitutes them a series is the persistence under various forms in all the members of the Rougon family of a moral taint which is transmitted in accordance with Zola's views of heredity. The series consists of the following works: 'La Fortune des Rougon' (1871); 'La Curée' (1874); 'La Conquête de Plassans' (1874); 'Le Ventre de Paris' (1875), treating of the Paris markets; 'La Faute de l'Abbé Mouret' (1875), whose subject is clerical celibacy; 'Son Excellence Eugène Rougon' (1876); 'L'Assommoir' (1877), a powerful but revolting study of the effects of drunkenness and idleness, the first great success of the series; 'Nana' (1880), a coarse picture of courtesan life; 'Pot-Bouille' (1882);

'*Au Bonheur des Dames*' (1883), dealing with the great shops of Paris; '*La Joie de Vivre*' (1883); '*Germinal*' (1885), treating of the life of French miners; '*L'Œuvre*' (1886), in which he dissects literary and artistic decadents; '*La Terre*' (1888), a study of the French peasantry in which prurient naturalism reaches the zenith of repulsiveness; '*Le Rêve*' (1888); '*La Bête Humaine*' (1890), treating of railways; '*L'Argent*' (1891), dealing with stockbrokers and company promoters; '*La Débâcle*' (1892), a powerfully realistic picture of military life in connection with the Franco-German war and the break-up of the Second Empire; and '*Le Docteur Pascal*' (1893), in which the whole is brought to a conclusion. Immediately after completing this huge undertaking he started the '*Trois Villes*' series, consisting of '*Lourdes*' (1894), '*Rome*' (1896), and '*Paris*' (1897), in which he portrays the spiritual development of a priest, Pierre Froment, out of miraculous Christianity through a sort of social Catholicism into a creed of justice and labor. In the incomplete tetralogy entitled '*Les Quatres Évangiles*' ('*The Four Gospels*') he proposed to formulate his social gospel. The first volume is '*Récondité*' (1900), whose hero, Mathieu, is the son of the hero of the preceding series. The second volume, '*Travail*' ('*Labor*,' 1901), has a hero named Luc; and of the remaining two, '*Vérité*' ('*Truth*') and '*Justice*,' whose heroes were to be named after the other two evangelists, the former was appearing at the time of his death. In the eyes of English readers Zola appears best in his short stories, of which, in addition to those already mentioned, collections entitled '*Le Capitaine Burle*' (1882), and '*Nais Micoulin*' (1883) have been published. His famous story of '*L'Attaque du Moulin*' forms part of the volume of '*Soirées de Médan*' (1880), to which Maupassant and other friends also contributed. He defended his view of the nature and function of literary art and collected many critical articles in several works. Several of his novels were dramatized by himself and others, and he also wrote for the stage '*Les Héritiers Rabourdin*' (1874), and '*Le Bouton de Rose*' (1878), but none of them except '*L'Assommoir*' (1881), known in Charles Reade's English version as '*Drink*' (1879), were at all successful. Zola's chivalrous defense of Captain Dreyfus (q.v.) in 1898 led to his trial and condemnation to imprisonment and fine. He was created a knight of the Legion of Honor in 1888 and an officer in 1893, but after his condemnation in 1898 his name was removed from the roll. He was president of the Société des Gens de Lettres in 1891-4, but he was repeatedly refused admission to the Academy. Zola was the recognized head of the naturalistic school in fiction, but his followers were latterly few in number. His novels belong rather to the domain of science than to that of art. They are studies, in the main faithful enough though not free from distortion and exaggeration, in moral and social pathology; but they are not true to life and nature in the fullest sense, in the only sense which would entitle them to rank as artistic creations. Translations of the most important have appeared, chiefly by Vizetelly. Consult Brunetière, '*Le Roman Naturaliste*' (1883), and R. H. Sherard's highly

eulogistic biographical and critical study (1893).

Zollars, Ely Vaughan, American educator: b. near Lower Salem, Washington County, Ohio, 17 Sept. 1847. Graduated from Bethany College (W. Va.) in 1875, he was pastor of the church of the Disciples of Christ at Springfield, Ill., in 1885-8, and in 1888-1902 was president of Hiram College (Ohio). His writings include '*Holy Book and Sacred Day*' (1893); '*Bible Geography*' (1894); '*Great Salvation*' (1895); and '*Hebrew Prophecy*.'

Zollicoffer, zöl'f-köf-ër, Felix Kirk, American soldier: b. Maury County, Tenn., 19 May 1812; d. near Mill Springs, Ky., 19 Jan. 1862. He entered the printer's trade, published a weekly newspaper at Paris, Tenn., for about a year, and finally became editor of the '*Observer*' at Columbia, Tenn., his duties being temporarily interrupted by his service in the Seminole war, in which he rose to be a commissioned officer. At Columbia he also published and edited an agricultural weekly. He became editor of the Nashville '*Banner*,' the leading Whig organ of Tennessee, in 1841; in 1844-9 was State comptroller; and in 1853-9 was a representative in Congress. In 1861 he entered the Confederate army with brigadier's rank. He was in immediate command at the battle of Mill Springs, on the Cumberland, when Thomas drove the Confederates from the field, and achieved the first real victory for the National cause. Zollicoffer was killed within the enemy's lines, whither he had passed by mistake while on a tour of reconnaissance.

Zolling, tsöl'ling, Theophil, German editor and author: b. Scafati, near Naples, Italy, 30 Dec. 1849; d. Berlin 23 March 1901. He was educated at Vienna, Heidelberg, and Berlin, and from 1881 was editor of the Berlin weekly, '*Die Gegenwart*.' Unsuccessful with his dramas, he wrote some works of fiction that were well received,—among them '*Der Klatsch*' (1889); '*Coulissenmeister*' (1891), and '*Bismarck's Nachfolger*' (1894). For Kurschner's '*Deutsche Nationalliteratur*' he prepared a four-volume critical edition of the works of Heinrich von Kleist (q.v.).

Zöllner, tsel'nër, Karl Friedrich, German physicist and astronomer: b. Berlin 8 Nov. 1834; d. Leipsic 25 April 1882. Educated at Berlin and Basel, he became a lecturer in the University of Leipsic in 1865, in 1866 professor extraordinary of physical astronomy, and in 1872 professor ordinary. He made numerous contributions to astronomical science. These included the determination of the reflective capacity (albedo) of many planets and a study of their thermal conditions; photometric investigations of the Mercurian phases; and a study, through observation, of the intensity of solar radiations at their source, of the solar temperature. His '*Grundzüge einer allgemeinen Photometrie des Himmels*' (1861) contained the description of a new instrument, the astrophotometer, for the measurement of the light and color of stars. To the publications of the Royal Saxon Scientific Society he furnished many papers on the physical constitution of the sun and stars; and he constructed spectroscopic instruments. '*Ueber die Natur der Kometen*' (1872; 3d ed. 1883) expounded the theory that

the brightness of comets is due not to the fact that they are incandescent through heat but that they are glowing with electricity. Zollner was latterly interested in spiritualism. Among his further volumes are 'Photometrische Untersuchungen' (1865), and 'Ueber die universelle Bedeutung der mechanischen Principien' (1867). Consult the study by Körber (1899), and Clerke, 'Popular History of Astronomy in the 19th Century' (1893).

Zollverein, tsöl'fēr-in" ("customs-union").

The feeble German Confederation formed in 1815 failed in many respects to meet the desire for union among the German people, or even to satisfy their practical requirements. The trade of Germany in particular suffered much from the obstructions caused by the different customs systems of so many petty states. In 1818 Prussia took the initiative of abolishing internal customs, but this policy excited much opposition among the other German states, and even on the part of the Bund itself, which was indeed to some extent justified by the coercive measures used by Prussia to enforce the adoption of its policy on the smaller German states within its bounds. Prussia offered to admit the other German states within its union, but many of them preferred to set up rival and antagonistic associations. Thus Bavaria and Wurtemberg formed a customs league in 1827, and Hohenzollern joined these states in 1828. In the same year was formed the Middle German Union, including Saxony, Hanover, Hesse, Brunswick, Nassau, Oldenburg, Bremen, Frankfurt-on-the-Main, etc., and in 1834 another union (Stenerverein) between Hanover, Brunswick, Schaumburg-Lippe, and which was joined by Oldenburg in 1836. But these hostile unions were not sufficiently extensive to have any great vitality, and they were gradually disintegrated by the desertion of their individual members to join the Prussian union. Electoral Hesse joined in 1831; Bavaria, Wurtemberg, Saxony, and other states in 1833; Hesse-Homburg, Baden, and Nassau in 1835; Frankfurt in 1836; Luxembourg in 1842; Hanover, Oldenburg, etc., in 1851. During the treaty period of 1854-65 nearly all Germany, with the exception of Austria, the two Mecklenburgs, and the Hanse-towns, was included in the union. A difference of views between the various parties to the union began at this time to develop, which caused much tedious negotiation. In general the north of Germany was in favor of imposing import duties on foreign trade for purposes of revenue only, while the south favored protective duties. As each member of the Zollverein had an equal voice in the direction of a common policy it was impossible to adjust these differences so as to satisfy the more powerful states, particularly Prussia. Austria also wished either to be included in the union or to break it up. Matters continued substantially in the same state after the renewal of the treaty from 1 Jan. 1866 to 31 Dec. 1867; but the war of 1866 put an end to this agreement, and new arrangements were entered into according to the political combinations then formed, Prussia obtaining a preponderating influence in the union of 1867, which included the North German Bund, Bavaria, Wurtemberg, Baden, Hesse (south of the Main), and Luxembourg. It was directed by a

Zollbundesrath and a Zollparliament. The total number of votes in the Zollbundesrath was 58, of which Prussia had 17. This arrangement, formed for 12 years, was also brought to an end prematurely by the formation of the German Empire. By article 33 of the constitution of the empire the territory included in the Zollverein is to coincide with the territories of the empire, with a few exceptions noticed below. The powers of the Zollbundesrath and Zollparliament are transferred to the legislative bodies of the empire, and the affairs of the central bureau of the Zollverein are transferred to committees formed by the Federal Council of the empire. The territories of the free ports of Hamburg and Bremen were for some time excluded from the Zollverein, and some communes of the grand duchy of Baden and a fragment of Hamburg are still excluded from it; while Luxembourg and the Austrian commune of Jungholz are included in it. See GERMANY.

Zol'nay, George Julian, American sculptor: b. Hungary 4 July 1863. He was for a time in the civil service, but subsequently studied at the Imperial Academy of Fine Arts, and in 1892 came to America, where he was connected with the staff of sculptors of the World's Columbian Exposition. His work at the Nashville, Tenn., exposition of 1897 attracted considerable attention. Among important examples of his art are a tympanum for the University of Virginia, a bust of E. A. Poe for the same, a statue of Jefferson Davis at Richmond, Va., and numerous portrait busts.

Zom'ba, capital of the British Central Africa Protectorate, situated in Nyassaland, on the southern slope of Mount Zoba, 10 miles west of Lake Shirwa, at the height of about 3000 feet above the sea. Zomba is in telegraphic communication with the principal stations in Central Africa and Cape Town. A sanatorium has been built on a plateau 2,500 feet higher up. The population is as yet small.

Zombor, zöm'bör, or **Sombor**, Hungary, a town of the comitat of Bács-Bodrog, on the Baczer or Franzens Canal, which unites the Theiss with the Danube, 65 miles southwest of Szegedin. It has two Greek churches, a magnificent town-house, and a public library, and carries on manufactures of silk. There is a large trade in cattle and corn. Pop. (1900) 29,609.

Zona Libre, sō'na lē'brā, a strip of country extending along the whole northern frontier of Mexico, 20 kilometres wide, where imported goods are admitted at 10 per cent of the ordinary duties for use within the zone. This zone was first established on the frontier of the state of Tamaulipas alone, in 1858, and was not extended across the whole frontier until 1885. At one time after the Civil War, the United States authorities claimed that the privileges permitted within the zone encouraged smuggling; the Mexican government claims that the conditions of retail trade make the zone a necessity; opposition to the zone, however, exists among competing manufacturers in the interior of Mexico.

Zon'aras, Joannes, Byzantine historian of the first half of the 12th century A.D. He filled some distinguished offices about the imperial court, but gave himself up to a religious life as

ZONE—ZOOGEOGRAPHY

a monk of Saint Basil, employing his leisure hours in the compilation of a 'History of the World from the Earliest Periods to the Year 1118.' In this work (of which an edition appeared at Paris in 1686) he follows principally the narrative of Dio Cassius, of whose first 20 books nothing is extant save Zonaras' abstract; but as he approaches his own times he becomes more entitled to attention, as his mistakes arise evidently more from ignorance than design. There is also extant a commentary on the apostolic canons by him. There is an edition of the 'History' by Pinder (1841-4), with a third volume by Büttner-Wobst (1897).

Zone, the term applied to any portion of the earth's surface bounded by two parallels of latitude, but more particularly applied to five such zones, the position of which is marked by natural boundaries. These five zones are called the torrid, northern and southern temperate, and northern and southern frigid zones. The torrid zone extends $23\frac{1}{2}^{\circ}$ north and south of the equator; and twice a year the sun shines vertically on its inhabitants. This zone is bounded, on both sides of the equator, by the two tropics; that is, the circles in which the sun reaches its greatest distance from the equator. As the rays of the sun here are nearly vertical a perpetual summer reigns, and day and night under the equator are always equal; and even at the tropics the difference is scarcely an hour. Owing to the nature and situation, however, of the countries in this zone the heat is not everywhere the same. The warmest portions are the sandy deserts of Africa; in the regions nearer the equator where vegetation prevails the heat is less excessive, in the islands of the South Seas a milder climate prevails, and the highest mountains of Peru and equatorial Africa are covered with perpetual snow. The two temperate zones extend from the tropics to the polar circles. They contain the most populous countries, and the climate is various. As the distance from the tropics increases the heat under similar conditions diminishes, the difference of the seasons becomes greater, the days and nights become more unequal until we arrive at a point where once a year the sun does not appear above the horizon during the 24 hours, and once a year does not set for the same time. The circles passing through these points, parallel to the equator and the tropics, form the limits of the temperate zones, and are called the arctic and antarctic circles. The distance from the tropics to the polar circles, or the breadth of the temperate zones, both in the northern and southern hemispheres, is 43° . All beyond the polar circles to the poles is called the frigid zones. The distance from the polar circles to the poles is $23\frac{1}{2}^{\circ}$. The characteristic of the frigid zones is, that day and night are more and more unequal the nearer you approach the poles; and for days, weeks, and even months the sun is either constantly above or constantly below the horizon. At the poles the year consists of one day and one night each six months long.

Zoogeography, the science of mapping out the surface of the earth with reference to its faunas; the study of the distribution of animal life. It has always been obvious to travelers, and even the most superficial students of nature, that the various regions of the earth's surface were

characterized, among other differences, by local peculiarities in animals and plants. It is a commonplace of knowledge that the animal life of the tropics is different from that of the Arctic regions; that the birds and mammals and small creatures of Africa differ almost altogether from those of South America or Australia. Closer examination shows that such differences exist in a greater or less degree between lesser regions, as the east and west sides of a continent, groups of islands separated by a sea-space, and so forth. On the other hand, there may be found striking resemblances in the faunas of certain separate regions, or a sameness over an extensive area, as Europe and Asia.

The importance and significance of these facts impressed themselves upon scientific men only within recent times. As long as it was held that each species must have been created, as a general rule within the geographical area which it now occupies, the most curious facts of distribution could be regarded only with "sterile wonder." But when the idea came to be entertained that allied species have had a common origin, it was obviously implied that they or their ancestors must have had a common birthplace; and consequently, when we find members of a group severed from their nearest kindred, we feel bound to inquire how this came about. Thus, we have to explain how the tapirs are confined to the Malayan region and South America; the camels to the deserts of Asia and the Andes; marsupials to the Australian region and America; how the birds, mammals and reptiles of North America resemble those of Europe more than those of South America, and so on.

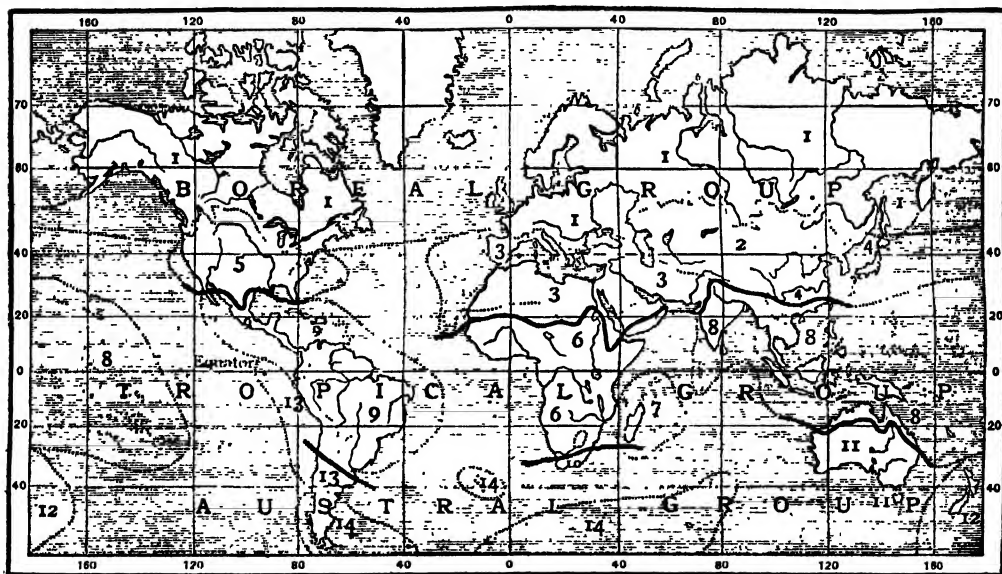

Means of Dispersal.—Accepting as a starting point the proposition that the various forms of life originated in some parent-stock or stocks at a particular place or places, the present distribution of their descendants as we know them, must depend mainly upon the powers of dispersion which each possessed, and the character of the physical influences and obstructions which acted as controlling factors or barriers in guiding their dispersal along certain lines and altogether prevented it elsewhere. Theoretically a new stock would spread equally in all directions from its point of origin; actually a very irregular and complicated kind of distribution has ensued in most or all cases. Hence an inquiry as to the means and limitations of dispersion possessed by animals and plants is of first importance.

It is scarcely necessary to draw attention to the facilities for diffusion possessed by animals endowed with great locomotive powers, and especially, among land animals, by those having the power of flight (q.v.); but it is important to note that some animals, which in the adult state have only feeble powers of locomotion, are better endowed in this respect when young. Such, for example, is the case with echinoderms, marine mollusks, and similar lowly aquatic forms, all of which develop from free-swimming and often far-drifting larvæ. (See PLANKTON.) But accidental modes of dispersal must also be taken into account. The carrying power of winds is known to be sufficient to bear along in the air fine dust across seas many hundreds of miles in width; and we have in that agency alone an adequate means of accounting for the dispersion of all plants propagated by minute spores.

For that reason the distribution of most cryptogamic plants hardly enters into the problem, since these mosses, fungi, seaweeds, and the like are almost universal. What part winds may have played in carrying the seeds of flowering plants is more doubtful; but observations show that even for such seeds, especially when provided with some kind of feathery appendage, winds may occasionally serve as a means of transport for very long distances. See PLANT GEOGRAPHY; PLANT LORE.

But in the case of animals also, winds are a more important means of transport than one might at first suppose. Birds and insects are often blown immense distances out of their course; and to this cause, for instance, is due the arrival every year of American birds on the coasts of Great Britain and France, while European birds almost never reach America—a fact plainly due to the prevalent easterly direction of the winds, and especially the gales in spring and autumn,

Further, marine currents often carry on their surface various kinds of natural rafts, which may transport both plants and animals. In the polar regions icebergs and icefloes may serve this purpose; and elsewhere trunks of trees, and even fragments torn from the land. Such fragments, forming small islands with erect trees upon them, have been seen at a distance of 100 miles from the mouth of the Ganges and other rivers. Wallace points out that ocean waifs of one kind or another are almost the only means we can imagine by which land-shells can have acquired the wide distribution for which they are remarkable. Again, locomotive animals are very frequently the means of dispersing both plants and other animals. Seeds may be attached to the fleece or fur of mammals or the plumage of birds, or may be enclosed in clumps of earth clinging to the feet or some other part of bird or beast, even of insects. It seems probable that aquatic birds and water-beetles have been the means of distributing aquatic plants and fresh-

when birds are migrating. Insects have been caught on ships upward of 300 miles from land. Further, there are well authenticated cases of even crabs, frogs, and fishes being carried long distances by storms, and in this way it is possible to account for the transference of fish, etc., from one river system to another. Still more frequently, in all probability, are the eggs of such creatures transported by this means.

Next, marine currents also form, beyond doubt, a highly important means of dispersal both for plants and animals, and that in various ways. First, seeds may float on the surface of the ocean, and be carried by currents for hundreds of miles, and become stranded on a distant shore still in a condition fit for germination. The experiments of Darwin to determine the vitality of seeds in sea-water first enabled us to appreciate the importance of this factor.

water mollusks, which are remarkable for their wide diffusion; and the spawn of amphibians and fresh-water fishes may be conveyed from one body of fresh water to another by the same means.

Lastly, man is often unintentionally the means of conveying both plants and animals from one region to another. The foreign plants found growing on ballast heaps near every civilized port, are instances of this, and so, also, are the plants which have sprung from seeds introduced with imported grain and merchandise. The whole coastal region of North America is overrun with European weeds. Wherever European ships have gone the rats and other vermin of the Old World have accompanied them, and hundreds of species of exotic injurious insects are known in all agricultural districts.

ZOOGEOGRAPHY

Obstacles to Diffusion of Animals.—For all land plants and land animals, the most obvious and effective barrier is a wide expanse of ocean; and where the expanse is very wide it is seldom passable except with the aid of man. For land mammals the ocean is an absolutely impassable barrier, and hence native mammals are always absent from oceanic islands (that is, islands that have never been connected with the mainland); and this barrier is almost equally effective for serpents and amphibians, which also are nearly always wanting where there are no native mammals. Lizards are more frequently found indigenous on oceanic islands, though their means of transit from the mainland is unknown. Arms of the sea and broad rivers are likewise generally impassable for the creatures mentioned, though some of them have greater powers of swimming than is generally supposed. The jaguar, the bear, and the bison are capable of swimming the widest rivers; pigs have been known to swim ashore when carried out to sea to a distance of several miles; and even a boa constrictor, it is said, has swum to the island of St. Vincent from the South American coast—a distance of 200 miles.

Mountains, and especially high mountains, are also frequently effective barriers to the migration of land plants and animals; but in some cases they enable plants and animals of a cold climate to spread into latitudes where, in the plains, the climate is too hot for them. Again, deserts act as a barrier to the majority of plants and animals; forests are a barrier to the camel, hare, zebra, giraffe, etc.; treeless regions to apes, lemurs, and many monkeys; plains to wild goats and sheep. Broad rivers also act occasionally as barriers to distribution, and that, strange to say, even in the case of some species of birds.

Another important barrier is that of climate; but climate merely limits the range of a species or group within a continuous area, for example, through limiting the food supply by restricting vegetation. The range of insects is peculiarly liable to be limited in this way, certain insects being attached to particular species of plants, and others to genera or families; and for this reason insects, in spite of the exceptional facilities for dispersal which many of them enjoy, are remarkable, as a rule, rather for the restriction of their areas of distribution than for their wide diffusion. Various other minor factors might be mentioned.

But a more generally operative organic barrier consists in the fact of a region being already fully occupied by a native flora and fauna, so that there is no room for new-comers. Hence it happens that seeds may be wafted in plenty from one country to another without a single plant growing from these seeds being able to establish itself; and there may even be, as in South America, a free communication with another region while the fauna remains strikingly distinct, simply because that portion of the American continent is already completely stocked with a fauna perfectly adapted to the physical conditions there prevailing.

The barriers to the spread of marine creatures are not so numerous as in the case of terrestrial forms. The freedom of communication between one part of the ocean and another makes it impossible to mark out any marine zoogeographical regions, though many seas and

coasts are distinguished by characteristic fishes and other marine creatures. The principal barriers for fish are temperature and the intervention of land. Thus, the Isthmus of Panama is at present a complete barrier for fishes requiring warm seas. See FISH, GEOGRAPHICAL DISTRIBUTION OF.

Geological Evidence.—If all the barriers to migration had existed in all past time as they are now, it would be quite impossible to explain the present distribution of plants and animals on the supposition that kindred groups have had a common birthplace. But the solution of the problems of distribution is to be found in the fact that all the barriers are liable to change. Of changes of sea and land geology supplies us with abundant evidence. Portions of the mainland now continuous were at one time severed by arms of the sea; and islands have been formed by the severance of portions of land that once belonged to the mainland. Such islands are known as continental islands, and the study of their faunas and floras is one of peculiar interest in connection with geographical distribution. These faunas and floras show, as might be expected, a greater or less degree of correspondence with those of the mainland from which the islands have been cut off; and the resemblance is the closer the more recently the land connection has been destroyed. The relative date of the disunion is usually approximately indicated by the depth of the sea which now separates island and mainland, shallow seas dividing portions of land that have only recently been disconnected, and deeper seas separating those which have been longer apart.

The most remarkable case of isolation is presented by the Australian region, the fauna and flora of which are the most peculiar in the world. In the widest sense, this region includes not only the vast island of Australia itself, but also New Guinea and all the Malayan and Pacific islands to the east of a deep channel between the islands of Bali and Lombok—a channel the significance of which, as a boundary line for plants and animals, was first pointed out by A. R. Wallace, the great authority on animal distribution, and hence known as Wallace's Line. The great feature of this region (so far as animal distribution is concerned) is "the almost total absence of all the forms of mammalia which abound in the rest of the world, their place being taken by a great variety of marsupials." The family just mentioned, though now restricted in the manner stated at the beginning of this article, was at one time spread over the whole world, but has in most parts become extinguished by the competition of later types; thus presenting one of the best examples of what are known as discontinuous areas of distribution, and offering an illustration of the mode in which such discontinuity is usually brought about. The early severance of the Australian region from the Asiatic continent (in the Mesozoic Age) saved the Australian marsupials from the competition which almost extinguished the group elsewhere.

Turning now to marine distribution, we find evidence of the former absence of a land barrier at the Isthmus of Panama in the identity of many species of fish on both sides of the isthmus.

Changes in the climatic barrier have also had

ZOOGEOGRAPHY

an important influence on geographical distribution; and it is by such changes, combined with changes in the continuity of land in the north polar regions, that the affinities between the floras of Japan and eastern North America must be explained. When these affinities were first pointed out by Asa Gray, that distinguished botanist divined the true explanation—namely, that in former geological epochs, a genial climate must have prevailed even within the polar circle, so as to allow of the existence of a remarkably uniform flora, suitable to such a climate, all round the pole in very high latitudes; and that as the climate became colder in the North this flora was driven southward, and became differentiated according to the differences of climate in the more southerly latitudes to which it advanced. Hence the eastern parts of America and Asia, as they correspond pretty much in climate, came to correspond also more closely than other tracts in the same latitude in the character of their floras. The soundness of

mammals, the regions adopted by Wallace are nearly the same as those first suggested by Sclater as applicable to the distribution of birds; for, in spite of the exceptional facility which birds have for crossing barriers impassable by mammals, Wallace finds that the distribution of mammals (which afford the best means of marking off zoogeographical regions) corresponds with that of birds to an extent that one would not perhaps have previously anticipated. But with regard to these regions it must be remembered (1) that it is impossible in most cases to draw any very clearly marked boundary line between one region and another; (2) that the degree of divergence between different regions is different in different cases; and (3) that, when any two regions are compared, we have not the same degree of divergence between different groups of the animal kingdom, or between animals and plants belonging to the two regions. Obviously, the degree of correspondence depends largely on the facilities for dis-

The Zoogeographical Regions according to Sclater and Wallace:

Sub-regions of Palearctic Region —	Sub-regions of Oriental Region —	Sub-regions of Neotropical Region —
1. European.	1. Indian.	1. Chilean.
2. Mediterranean.	2. Ceylonese.	2. Brazilian.
3. Siberian.	3. Indo-Chinese.	3. Mexican.
4. Manchurian.	4. Indo-Malayan.	4. Antillean.
Sub-regions of Ethiopian Region —	Sub-regions of Australian Region —	Sub-regions of Nearctic Region —
1. East African.	1. Austro-Malayan.	1. Californian.
2. West African.	2. Australian.	2. Rocky Mountain.
3. South African.	3. Polynesian.	3. Alleghanian.
4. Malagasy.	4. New Zealand.	4. Canadian.

this surmise was afterward confirmed by the discovery of abundant plant remains of the Miocene Age, indicating a warm climate in Greenland, Spitzbergen, and elsewhere. The effects on distribution of the changes of climate belonging to the Glacial Period or Ice Age may only be alluded to here.

Zoogeographical Regions.—As the result of all the processes of dispersal across the various barriers to migration, and of the changes in these barriers, we have the present distribution of plants and animals, which is such as to enable us to divide the terrestrial surface of the globe into more or less well-marked regions. For

persal, and largely also on the geological age of different groups; and both of these are varying factors. These considerations being premised, we may now state briefly the limits of the six zoological regions adopted by Wallace, as given in his 'Island Life.' In the space to which the present article is necessarily restricted it is impossible to give even the most fragmentary sketch of the characteristic life of the different regions, for which the reader must be referred to the works cited at the end of the article.

(1) Palearctic Region, including Europe and north temperate Asia and Africa to the northern borders of the Sahara.

(2) Ethiopian or Palæotropical Region, consisting of all tropical and South Africa, together with Madagascar and the Mascarene Islands.

(3) Oriental Region, comprising all Asia south of the Palæarctic limits, and the Malay Islands as far as the Philippines, Borneo, and Java.

(4) Australian Region, the Papuan Islands, Australia, New Zealand, and the islands of Oceania. Celebes might be referred almost with equal right to this or the previous region. New Zealand is treated by Wallace as a highly peculiar sub-region of this great region.

(5) Nearctic Region, comprising all temperate and arctic North America, including Greenland, and extending on the south to an irregular line running from the Rio Grande del Norte on the east to a point nearly opposite Cape Saint Lucas on the west.

(6) Neotropical Region, the American continent south of this line, together with the West Indian Islands, sometimes called Neogæa.

Heilprin and others advocate the union of the Nearctic and Palæarctic regions under the name of Holarctic, and introduce three transitional tracts (the Mediterranean, embracing southern Europe, northern Africa, and western Asia, south of the Caspian and west of India, but exclusive of the southern half of Arabia; the Sonoran tract, embracing the northwest of Mexico; and the Austro-Malaysian tract, embracing Celebes and the smaller islands lying between it and New Guinea and Australia). Otherwise his major faunal divisions of the globe are similar to those of Wallace.

On plant distribution the most important recent works are those of Engler and Drude. Engler attempts to trace the history of the vegetable kingdom since the Tertiary period, and comes to the conclusion that already in the Tertiary period four "floral elements" (*Florenelemente*) could be distinguished, namely:

(1) The Arcto-tertiary element, characterized by an abundance of conifers and numerous genera of trees and shrubs now prevalent in North America, or in extratropical eastern Asia and in Europe.

(2) The Palæotropical element, characterized by the presence of the families and sub-families dominant in the tropics of the Old World; and still more by the absence of certain families, groups, and genera found in the territory of the Arcto-tertiary element.

(3) The Neotropical or South American element, which, according to Engler, must have had in Tertiary times much the same character as that now possessed by tropical Brazil and the West Indies.

(4) The old Oceanic element, consisting of forms which possessed the power of traversing considerable stretches of ocean and developing further on islands.

The modern provinces of the vegetable kingdom are subordinated by Engler to these great divisions. Drude, in the first place, distinguishes the oceanic (marine) flora from the terrestrial forms, and the latter he divides into three great groups, and these again into 14 floral domains. See PLANT GEOGRAPHY.

Zoöl'atry, the worship of animals. This seems to have passed through three stages: (1) The animal was revered and propitiated as possessing a power greater than that of man. (2) The animal was regarded as an incarnation of some deity or spirit. (3) It was raised to the position of a tribal ancestor. In the early history of the human race zoöl'atry of some kind was very prevalent. Traces of it appear in the Bible, as in the story of the Golden Calf made by the Israelites (Ex. xxxii.). Zoöl'atry took deep root in the religious life of the ancient Egyptians, and all three forms flourished among that people. Juvenal opens his 15th satire with a scathing invective of Egyptian zoöl'atry, and detailed accounts of it occur in Herodotus, Plutarch, Strabo, and Cicero. In classic times the chief form of zoöl'atry was serpent worship, though traces of other forms occur in the transformation myths of the poets. In the present day zoöl'atry survives chiefly in India and among the snake-worshippers of the west coast of Africa. See NATURE WORSHIP.

Zoological Gardens, or Parks, places for the keeping and attractive display of living animals, where they may live, as far as possible, in the open air and under natural conditions; a zoological garden thus differs from a menagerie, as that term is now understood, in that in the latter the animals are confined in narrow prison-cages, under cover, and are usually borne from place to place to be displayed for a fee. Collections of captive animals have always been kept by royal and eminent persons, and formed a large element in the sights and amusements of the populace in ancient and mediæval cities. The present conception of zoological collection, as a place where animals shall be maintained in the greatest practicable freedom for the sake of exhibiting their traits to the student, and shall be regarded only secondarily as objects of curiosity, is a modern idea, and one that has been developed to its highest degree in the United States. Many large cities of the Old World have "zoos," as they are popularly called, notably London, Dublin, Berlin, Paris, Vienna, Amsterdam, Rotterdam, Antwerp, Hamburg, Copenhagen, Hanover, Cologne, Bombay, Calcutta, Tokio, Melbourne, and several South American cities, especially Rio de Janeiro and Buenos Ayres. All of these are the property of a society or private ownership of some sort except the garden in Berlin, and that attached to the Museum of Natural History at the Jardin des Plantes, in Paris. They are sustained, therefore, partly by membership subscriptions, and partly by gate-receipts, but most or all of them give free days. The sale of animals born and reared within their precincts is a source of revenue with some, as, for instance, the Dublin garden which has supplied a large proportion of all the lions now held in captivity by circus and traveling menageries. The Berlin "zoo"

stands first in the number of its animals and general excellence of arrangements; but that of London, founded in 1828, is nearly its equal; and the splendid series of volumes constituting the 'Proceedings' and 'Transactions' of the Zoological Society of London attest the admirable use which has been made of the collection by naturalists.

Zoological gardens have long existed in the United States, among the oldest being those at Cincinnati and Philadelphia, both privately sustained, and each highly creditable. To these were added collections of living animals in the parks of various cities, maintained by municipal appropriation, among which those in Central Park, New York; Schenley Park, Pittsburgh; Lincoln Park, Chicago; Belle Isle, Detroit; and Golden Gate Park, San Francisco, are important.

The National Zoological Park at Washington was established in 1889, in a large tract of hilly and forested land along Rock Creek in the outskirts of Washington. Its prime purpose was to gather a representative collection of American animals and possibly preserve from extinction species threatened with racial destruction. It has extensive and highly picturesque grounds, and its collection of animals have remarkably favorable surroundings and are kept in admirable condition. The support of this free park, one half of which comes from Congress and one half from the District of Columbia, has not been sufficiently liberal to make its development as rapid as its friends desire.

The latest and foremost American zoological park is that in the northern part of the city of New York, which is under the control of the New York Zoological Society, to which the city granted 261 acres of land in Bronx Park, police protection, and various aids and immunities. This is the largest and most suitable space devoted to the care and exhibition of animals anywhere in the world; and since its opening in 1897 it has developed into a most prominent and useful position among the world's institutions of this kind. The society had in 1904 about 1,500 members, and had begun the issue of a series of important periodical publications. This park has been developed and remains under the care of William T. Hornaday.

Zoological Laboratories and Stations. See LABORATORY.

Zool'ogy, that branch of biology, or the science of living things, which treats of animals. The scope of the science may be gathered from the following enumeration of its main branches: (1) *Morphology*, which treats of the outer form and internal structure of animals, their anatomy, histology, physiology, etc.; (2) *Embryology*, or ontogeny, treating of the development of individual animals from their earliest discernible stage; (3) *Theremmatology*, treating of "breeding or propagating animals and plants under domestication, of their congenital variations under these circumstances, and of the perpetuation of such variations"; (4) *Paleozoology*, or animal paleontology, treating of fossil animals; (5) *Phylogeny*, which seeks to investigate the evolution of the various groups or types of animals; (6) *Taxonomy*, or *Systematic Zoology*, treating of the classification of animals,—their arrangement in

groups determined by genetic relationships; (7) *Bionomics*, or *Ecology*, which investigates the conditions of life as a whole, habits, instincts, etc.; (8) *Zoogeography*, dealing with the distribution of animals on the surface of the earth. So comprehensive a view of zoology is a modern conception and has resulted from the conviction of the unity of organic nature and the kinship of descent which pervades the whole realm of beings, past and present. In the earlier days of the study of nature each group of animals was considered by itself, and to each such study was naturally given a name, many of which survive as convenient terms in descriptive zoology. Such are *Conchology*, the study of shells (of mollusks), and hence the study of the *Mollusca*; *Entomology*, the study of insects; *Herpetology*, the study of reptiles (popularly including amphibians); *Ornithology*, the study of birds; and so on. For detailed information upon animals and the various aspects of their instigation consult articles under their names, as birds, horse, pompano, etc.; under the technical names of groups, as Carnivora, Camelidæ; and under such terms as Ichthyology, Herpetology, and the like. See also ANATOMY; ANIMAL HEAT; BIOLOGY; BIONOMICS; BREEDING; CELL; COLORATION, PROTECTIVE; DARWINIAN THEORY; EMBRYOLOGY; EVOLUTION; GROWTH; HEREDITY; HYBRIDITY; INSTINCT; LAMARCKISM; LIFE; MIMICRY IN NATURE; MIGRATION; NATURAL SELECTION; ORGANS; PALÆONTOLOGY; REPRODUCTION; WEISSMANISM; ZOOGEOGRAPHY, and related topics; and consult the authorities cited in their accompanying bibliographies.

Zoology, History of, the record of discovery in the science of zoology. The history of zoology may be regarded as beginning with Aristotle (384-322 B.C.), whose works reveal a classification of animals into the two main groups of Enæma or blood-containing animals and Anæma or bloodless animals, the former including the four classes of viviparous enæma, equivalent to mammalia, birds, four-footed, egg-laying enæma, equivalent to reptiles and amphibians and fishes; and the last included the four classes of soft-bodied anæma (cephalopods), soft-shelled anæma (crabs and insects), and shell-bearing anæma (mollusks and echinoderms). Among Aristotle's successors in zoological investigation in ancient times were Herophilus and Erasistratus (3d century B.C.), both physicians who contributed to the progress of anatomy (q.v.); the elder Pliny (23-79 A.D.), who wrote a most uncritical work on natural history; and Galen (131-200 A.D.), who is chiefly important as an anatomist and physician. The mediæval period witnessed no further progress in zoology, and the bestiaries (q.v.), and books severally known by the title 'Physiologus' are of no scientific value. The revival of the study of Aristotle effected a change for the better, but modern zoology does not begin till the era of the Renaissance.

Modern History to Linnaeus—The discovery of new countries at the beginning of the modern period greatly increased the number of known animals, and it was accompanied by the growth of the scientific spirit. Extensive collections began to be formed, and in the 17th century academies and societies were founded for the promotion of scientific research. One of the oldest of these institutions was the Academia

ZOOLOGY, HISTORY OF

Naturæ Curiosorum, established at Schweinfurt in 1051, and it was soon followed by the Royal Society of London and the Academy of Sciences of Paris. In his work 'De Differentiis Animalium' (1552), Edward Wotton (1492-1555) presented Aristotle's zoological teaching without its mediæval accretions, and extended his master's classification by adding the group *Zoophyta*, in which he included holothurians, star-fishes, sea-anemones, sponges, etc. The work of the zoological revival was carried forward by, among others, Conrad Gesner (1516-65), whose 'Historia Animalium' (1551-8) may be regarded as an epoch-making work; Ulisse Aldrovandi (1522-1605); John Johnstone (1603-75), the last of the encyclopædists, who published a complete survey of the animal kingdom in four treatises (1649-53); Pierre Belon (1517-64), who wrote on fishes (1551), and birds (1555); Hippolyto Salviani (1514-72), author of a work on fishes; Guillaume Rondelet (1507-50), whose monograph on fishes is the chief of its time; Andreas Vesalius (1514-64), an anatomist; Hieronymus Fabricius (1537-1619), a pioneer in comparative anatomy; Thomas Willis (1621-75), who is of importance in the history of anatomy; Marco Aurelio Severino (1580-1656), an anatomist; Marcello Malpighi (1628-94), one of the pioneers in the application of the microscope to zoological investigation; Anton van Leeuwenhoek (1632-1723), another early microscopist of renown; Jan Swammerdam (1637-85), whose microscopic researches on insects, molluscs, and other animals were of the utmost value; Robert Hooke (1635-1703), of importance in the history of the microscope; William Harvey (1578-1657), who demonstrated the circulation of the blood and contributed in other ways to anatomical and physiological progress; Edward Browne (1643-1708), who made many dissections of animals; and Edward Tyson (1650-78), the first Englishman who published elaborate monographs of particular animals. John Ray (1627-1705), great as a botanist, is even greater as a zoologist. He did more for the science of animal life than any other man between Gesner and Linnaeus, and he has been justly called the father of modern zoology. He made zoological classification more truly scientific by clearly fixing the meaning of the term "species" and by using anatomical characters in the determination of the larger groups. With his name we may associate that of his friends Francis Willughby (1635-72) and Martin Lister (1638-1712), and Lister's friend, Edward Lhuyd (1660-1709). Among other zoologists of note in the interval between Ray and Linnaeus are Alexander Monro (1697-1767), a good comparative anatomist; Johann Philipp Breyn (1680-1764); Maria Sibylla Merian (1647-1717), who wrote on insects; Johann Leonhard Frisch (1666-1743), author of a description of the insects of Germany; René Réaumur (1683-1757), a distinguished entomologist; Johann Heinrich Linck (1674-1734); Jean Antoine Peyssonel (b. 1604), who established the animal nature of polyps; Jacob Theodor Klein (1685-1759), who proposed a purely artificial classification of animals; and John Woodward (1665-1728), an early palæontologist.

Linnaeus to Cuvier.—Karl von Linné (1707-78), usually called Linnaeus (q.v.),

marked a new era in both botany and zoology. He introduced the binary nomenclature of species, and he gave the science a fixed terminology. In his 'Systema Naturæ' (1735) he gave the first entirely modern classification of animals, using in his scheme the descending series of terms, class, order, genus, species, and variety, which has ever since been used in the same way for the purposes of classification. His classes are: I. *Mammalia*, with the orders Primates, Bruta, Feræ, Glires, Pecora, Beluæ, and Cete; II. *Aves*, with the orders Accipitres, Piceæ, Anseres, Grallæ, Gallinæ, and Passeres; III. *Amphibia*, with the orders Reptilia, Serpentes, and Nantes; IV. *Pisces*, with the orders Apodes, Jugulares, Thoracici, and Abdominales; V. *Insecta*, with the orders Coleoptera, Hymenoptera, Lepidoptera, Neuroptera, Hymenoptera, Diptera, and Aptera; VI. *Vermes*, with the orders Intestina, Mollusca, Testacea, Lithophyta, and Zoophyta. The principal zoologists of the period from Linnaeus to Cuvier are the following: Johann Friedrich Gmelin (1748-1804), who edited the 13th edition of Linnaeus' 'Systema'; George Louis L. Buffon (1707-88), author of a famous natural history (1749-88); Charles Bonnet (1720-93), known chiefly as an entomologist; O. F. Müller (1730-84), author of a fauna of Denmark; Thomas Pennant (1726-98), who wrote on the British zoology; Eberhard A. W. von Zimmermann (1743-1815), a pioneer in zoogeography; Peter Simon Pallas (1741-1811), who investigated and wrote on the fauna of Russia and Siberia; Mathurin J. Brisson (1723-1806), chiefly an ornithologist; Johann P. Eberhard (1727-79); Johann C. D. von Schreber (1739-1810); Johann C. Erxleben (1744-77); John Latham (1740-1837), and George Edwards (1694-1773), ornithologists; Bernard Lacépède (1750-1825), a student of reptiles, fishes, cetaceans, etc.; Johann G. Schneider (1750-1822), who wrote on the amphibians; Marcus E. Bloch (1723-99), an ichthyologist; Jean G. Brugnières (1750-68); Johann H. Chemnitz (1730-1800), a conchologist; Karl de Geer (1720-78), an entomologist; Johann C. Fabricius (1743-1808), a very eminent entomologist; Johann K. W. Illiger (1775-1813), another entomologist; P. Lyonnet (1707-89); Abraham Trembley (1700-84), who investigated fresh-water polyps; John Ellis (1710-76), who advanced our knowledge of corallines; Daniel C. Solander (1736-82), who assisted Ellis; Sir Joseph Banks (1743-1820); Jacques F. Dictionnaire (1733-89), a writer on sea-anemones; Filippo Cavolini (1756-1810), a student of marine polyps and fishes; Martin F. Ledermüller (1719-69), who introduced the term Infusoria; Albrecht von Haller (1708-77), an eminent anatomist and physiologist; John Hunter (1728-93), an eminent anatomist; Lazaro Spallanzani (1729-99), a physiologist; Marie F. X. Bichat (1771-1802), the founder of histology; Kaspar Friedrich Wolff (1733-94), whose dissertation entitled 'Theoria Generationis' (1759) is the starting-point of modern embryology; Jean Baptiste Lamarck (1744-1829), who fixed the two groups of *Vertebrata* and *Invertebrata*, and whose 'Philosophie Zoologique' (1809) is of the utmost importance in the history of the evolution theory; and the co-called nature-philosophers, including J. W. von Goethe

ZOOMORPHIC

(1749-1832); Lorenz Oken (1779-1851), and others, who also contributed materially to the development of evolutionary conceptions.

Cuvier to Darwin.—George Cuvier (1769-1832) is the only name of supreme importance in zoology between Linnæus and Charles Darwin. He rejected the view, held by Lamarck, that a linear classification of the animal kingdom is possible, and in his great work, 'Le Règne Animal' (1817), he grouped his classes in four embranchements, representing four fundamentally distinct types of structure. These branches, with their contained classes, are as follows: *Vertebrata*, including Mammalia, Birds, Reptiles, Fishes; *Mollusca*, including Cephalopoda, Pteropoda, Gasteropoda, Acephala, Brachiopoda, Cirrhopoda; *Articulata*, including Annelides, Crustacea, Arachnides, Insects; and *Radiata*, including Echinoderms, Intestinal Worms, Acalephæ, Polypi, Infusoria. He raised comparative anatomy to the dignity of a true science, and he carried out researches of the utmost value in palæontology. In the restoration of extinct animals from remains of parts he used his law of the correlation of parts according to which animals are so constituted that single organs or parts can serve as an index to all other parts and to the general structure. Of the numerous workers who advanced the study of zoology from Cuvier's time down to that of Charles Darwin we can only name the following: Geoffroy Saint-Hilaire (1772-1844), who opposed Cuvier's view regarding types; Johann F. Blumenbach (1752-1840), a distinguished comparative anatomist and physiologist; Ignaz Dollinger (1770-1841), an eminent anatomist and physiologist; Friedrich Tiedemann (1781-1861), also distinguished in anatomy and physiology; Karl A. Rudolphi (1771-1832), who wrote on physiology and intestinal worms; Karl Ernst von Baer (1792-1876), a most distinguished embryologist; C. H. Pander (1794-1865), also an embryologist; Martin H. Rathke (1793-1860), another eminent embryologist; Theodor Schwann (1810-82), the founder of the cell-theory; Johannes Müller (1810-58), "the greatest of all investigators of animal structure" in his century; Sir Richard Owen (1804-92), a great morphologist of the Cuvierian school, who introduced the conceptions of homology and analogy in regard to animal parts; Michael Sars (1805-69); Johannes J. S. Steenstrup (1813-97), who first emphasized the fact of alternate generation; Rudolf Leuckart (1822-98), who founded the sub kingdom of Coelenterata and set forth the phenomena of polymorphism; Karl T. E. von Siebold (1804-85), who established the sub kingdom Protozoa; Louis Agassiz (1807-73), a distinguished student of fossil fishes who held to Cuvierian traditions to his death; Christian G. Ehrenberg (1795-1876), who shed much fresh light on the Infusoria; Edward Forbes (1815-54), a distinguished investigator of the British marine fauna; Alcide D. D'Orbigny (1802-57), a palæontologist; Félix Dujardin (1801-60), who did valuable work on Infusoria, intestinal worms, and Medusæ; Antoine R. E. Claparède (1832-71), who wrote on Infusoria and Rhizopoda in collaboration with F. J. Lachmann (1832-61); William B. Carpenter (1813-85), an eminent physiologist and almost universal naturalist; Robert E. Grant (1793-

1874), a pioneer in the study of sponges; Max J. S. Schultze (1817-77), James S. Bowerbank (1797-1877), who did splendid work on the sponges; Henri Milne-Edwards (1800-85), whose special work was done on crustaceans, corals, and mammals; Johann F. Eschscholtz (1793-1831), known by a treatise on the Acalephæ; Stefano della Chiaje (1794-1860), who described Sicilian invertebrates; Jean L. A. Quatrefages de Breau (1810-92); Emile Blanchard (1820-1900), author of works on insects; Pierre A. Latreille (1762-1833), best known by his work on insects; William Kirby (1759-1850), an entomologist; Hermann Burmeister (1807-92), an entomologist and writer on the Brazilian fauna; Albany Hancock (1806-73), who studied the Mollusca, Tunicata, and Brachiopoda; Henri M. Ducrotay de Blainville (1778-1850); and John V. Thompson (1779-1847), who proved the crustacean character of Cirripedes and investigated the Polyzoa, the feather-star, etc.

Darwin and After.—The theory of the fixity of species was challenged at various times by different zoologists, notably by Lamarck, but it was not till the publication of 'The Origin of Species' (1859) by Charles Robert Darwin (1809-82) that the old view became generally abandoned and the evolution or development theory took its place. This has completely transformed the whole outlook of the zoologist and has brought new branches of the science into being, notably thremmatology. It makes the tree-like classification to which systematists have steadily advanced a truly genealogical tree, and it has contributed enormously to the progress of what may be called philosophical zoology. The natural-selection principle was independently discovered at practically the same time by Alfred R. Wallace (1823-), the eminent naturalist-traveler. Herbert Spencer had also formulated an evolution theory, extending to the whole of nature and life. Thomas Henry Huxley (1825-95), master of an admirably lucid and attractive method of exposition, and Ernst Hæckel (1834-), have done admirable work in embryology and other branches of zoology, and have contributed much to developing and popularizing the Darwinian views. August Weismann (1834-) is best known by his valuable contributions to the doctrine of heredity. The number of other zoologists who have done good work during the Darwinian period and under the influence of the Darwinian conceptions is so great that no attempt will be made to enumerate them.

Bibliography.—Lamarck, 'Philosophie Zoologique' (Paris 1800); Carus, 'Geschichte der Zoologie' (Leipsic 1872); Spencer, 'Principles of Biology' (London and New York 1898); Osborn, 'From the Greeks to Darwin' (New York 1894); 'Zoological Record' (London, annually).

Zoömor'phic, a word meaning, pertaining to or exhibiting animal forms. In anthropology, representing a god or other supernatural being under the form of one of the lower animals. The zoomorphic element in classic mythology appears in such cases as that of the Sminthean Apollo, and the metamorphoses of Jupiter; it is very strongly marked in the religion of ancient Egypt, and traces of it may be found among the Jews and in the Apocalypse.

Zoöphyte, ~~Zoöphyte~~ meaning literally animal plants, borrowed from Aristotle by Cuvier, and used by him as a synonym of *Radiata*. The term has no longer any specific value, but is often loosely applied as a designation for many plant-like animals, as sponges, corals, etc., more or less resembling plants in appearance.

Zöpfl, tsepf, **Heinrich**, German legal scholar: b. Bamberg, Upper Franconia, Bavaria, 6 April 1807; d. Heidelberg 4 July 1877. Educated at Würzburg, he became a lecturer at Heidelberg in 1828, in 1839 professor extraordinary of constitutional law, and in 1842 professor ordinary. He was elected university representative in the first chamber of Baden in 1850, and sat in the Unionsparlament at Erfurt. Among his works are: 'Grundsätze des Gemeinen Deutschen Staatsrechts' (1841; 5th ed. 1863), and 'Deutsche Staats- und Rechtsgeschichte' (1833-6; 4th ed. as 'Deutsche Rechtsgeschichte,' 1871-2).

Zorella Islands, East Indies. See XULLA ISLANDS.

Zorgite, a mineral from Zorge and Tilkerode in the Harz. Massive; brittle; hardness, 2.5; specific gravity, 7 to 7.5; lustre, metallic; color, lead or sometimes yellowish gray. A selenside of lead and copper in varying amounts.

Zorilla, thō-rē'ya, **Manuel Ruiz**, Spanish statesman: b. Burgo de Osma, province of Soria, 1834; d. Burgos 13 June 1895. He studied law at Valladolid and became an advocate at Madrid, where in 1856 he was chosen to the Cortes, in which he identified himself with the Progressive party, and displayed a vigorous hostility against the Neo-Catholics. Banished in consequence of the insurrection of June 1866, he remained in France until the revolution of 1868, when Serrano appointed him minister of commerce, education, and public works. In 1869-70 he was minister of justice, and later president of the Cortes. He was a supporter of Duke Amadeus of Austria for the Spanish throne; and when the latter became Amadeus I. was made minister of religious affairs. In 1872 he assumed the head of a radical ministry, but after Amadeus' abdication retired. On account of participation in the military revolt of March 1884, he was sentenced to death. He finally returned unharmed to Spain. Consult Villareal, 'Ruiz Zorilla desde la Expulsion de España hasta su Muerte 1875-95' (1903).

Zorn, tsörn, **Anders Leonard**, Swedish painter: b. Utmedal 18 Feb. 1800. He studied sculpture and painting at the Stockholm Academy. In 1882 he settled in London, where he attained special success as a portrait painter; and in 1889 went to Paris. He traveled widely in Sweden, Italy, Spain, England, the United States, and elsewhere; while in the United States he painted several portraits. His work includes landscape, genre, and portrait painting, as well as etchings of great merit. Among his paintings are 'Irish Maidens'; 'The Toast'; 'Italian Street Scene'; 'Summer in Sweden,' and portraits of Renan and of King Oscar; his etchings are mostly copies of his own paintings.

Zorn, Philipp, German jurist: b. Baireuth 13 Jan. 1850. After study at Munich and Leipzig, he became a lecturer at Munich in 1875, and in that year went as professor to

Bern. From 1877 he was at Königsberg, and in 1900 took a chair in the legal faculty at Bonn. In 1899 he participated as an expert in the Peace Conference at The Hague. Among his works are: 'Staat und Kirche in Norwegen bis zum Ende des 13ten Jahrhunderts' (1875); 'Staat und Kirche in der Schweiz' (with Gareis 1877-8); 'Staatsrecht des Deutschen Reichs' (2d ed. 1894-7); 'Deutsche Kolonialgesetzgebung (1901); and 'Die Deutsche Staatssprache' (1903).

Zorndorff, tsörn'dörf, Germany, a village of Brandenburg, Prussia, 53 miles northeast of Berlin. It is celebrated for the Prussian victory over the Russians 25 Aug. 1758, the Russians losing 21,529 men, and the Prussians about 11,000. See SEVEN YEARS' WAR.

Zoroaster, zō-rō-ās'tēr (from Gr. *Zaradathras*; Avestan, *Zarathushtra*; Persian, *Zardusht*), the founder of the Parsee religion. The life of Zoroaster is completely enveloped in legend, and except from the work he has accomplished little or nothing can be discovered regarding it. In later times, when his religion was fully established, he was almost worshipped as a divine being, considered as above the archangels and next to God, and then the actions attributed to him are supernatural, and his history legendary; but even in the later accounts of the Zend-Avesta there is a manifest reference to a human original, and we may see in their exaggeration the gratitude inspired by the active benevolence of a good man and great reformer. "He first thought good thoughts, first spoke good words, first performed good actions. He was the first priest, first warrior, and first cultivator of the soil. He first caused the wheel to turn among gods and among men." This particularity may perhaps indicate that the date of Zoroaster was not so remote as it has sometimes been placed. His history was already legendary in the time of Aristotle, who placed him 6,000 years before Plato; others have supposed him to be contemporary or identical with Moses. The latest date generally assigned to him is the 6th century B.C. Modern researches place his period not later than 1000 B.C., or perhaps several centuries earlier. He lived in the reign of Vataça or Gushtasp, a king of the Bactrian dynasty of Kāvja, anterior to the time of the Median and Persian monarchies. This king was a zealous propagator of the religion of Zoroaster. Bactria was the scene of Zoroaster's labors, and thence his religion spread over Media and Persia. He appears to have been one of the Soshyautos or fire-priests of the early Iranian religion. According to the theory approved by scholars, the nomad Aryans first settled to agricultural life in Bactria. These settlers, the ancestors of the Iranian races, became alienated from their brethren who continued the nomad life, and, suffering from their depredations, at length came to regard even their religion with abhorrence, and placed their gods among the devils of their own creed. The new religion of the Iranians recognized a plurality of good spirits called Ahuras, which were opposed to the Devas of the Brahmanical creed. It was while the national religion was in this transitional stage that Zoroaster appeared and molded the discordant elements of the national faith into a new system, the fundamental principle of which was monotheism. He called the

supreme being, to whom he directed that worship should be exclusively paid, Ahurō Mazdāō, the Ahura who is the creator of the world. This name has been successively modified into Ahuramazda in the cuneiform inscriptions, and Ormuzd (q.v.) among the modern Parsees. Zoroaster is said to have called himself a reciter of manthras, a messenger of Ahuramazda, one who received sacred words from Ahuramazda through the flames. The descriptions he gives of the nature of God are full of the most exalted conceptions; he calls him the Creator of the earthly and spiritual life; he who taught the suns and stars their way. He is not only a Creator, but an intelligent and moral ruler. While the views of Zoroaster's teaching derived from the earlier Gāthas thus represent him as inculcating a pure and elevating religion, a speculative philosophy is ascribed to him which not unnaturally led to misconceptions of his theology, and speedily corrupted the religion he established. He imagined two principles which exist in all things, and are respectively the causes of all good and evil. These he called the Vohu Mano, or good mind, and the Ahem Mano, or naught mind; they are twins, and though opposed are inseparable, being apparently the necessary opposites of each other. The one creates day and the other night; the former produces life, and the latter extinguishes it. These two minds exist in Ahuramazda as well as in all created things. Such is Zoroaster's account of the origin of good and evil in the universe. Subsequent interpreters of his religion soon developed these two principles into two distinct and powerful beings, Ormuzd and Ahriman, the good and evil spirits, and gave to each of them a court of attendant ministers or councillors, six in number, so that a hierarchy of good and evil spirits, seven of each kind, was again established as an object of worship. The first of the angels of Ahuramazda is Vohu Mano, the good mind of Zoroaster, who is represented as the son of Ahuramazda; after him comes Ardibihesht, who is represented as the blazing flame of fire. He is the preserver of life, and represents the omnipresence of Ahuramazda. Others preside over wealth, devotion, vegetation, etc. Besides the seven spirits there is an archangel Sraosha, who is possessed of great powers, and was the medium of revelation to the prophet. He first sang the five Gāthas of Zarathustra Spitama. He is the judge of men after death, and is worshipped for his power and purity. The dualism of the Persian creed is first developed in the Vendidad, which Haug dates partly as early as 1000 B.C., partly as late as 500 B.C. A small party continued to protest against the Zendic interpretation in favor of the ancient doctrine of Zoroaster as taught in the earlier Gāthas. They are said to have fallen into an opposite error of making the words Zervana Akarana, which simply mean time without bounds, into an independent being anterior to Ahuramazda. Among the doctrines of the Zend-Avesta are the distinction of a natural and a spiritual life, and a belief in immortality. Heaven is called the House of Hymns, and Hell the House of Destruction. Between heaven and hell is the Bridge of the Gatherer or Judge over which the good pass with safety, while the wicked are precipitated from it into hell. The resurrection of the body, the coming of a Messiah, Siosh,

son of Zarathustra, and final judgment, are foretold. Siosh is to be the last of three great prophets who are to precede the end of the world. The detailed description of the last judgment is contained in the Bundehesh. How far these doctrines are to be ascribed, as some hold, to Zoroaster, is doubtful. Consult Spiegel, 'Eranische Altertumskunde,' Vol. I. (1871); Haug, 'Essays' (2d ed. 1878); Brodbeck, 'Zoroaster' (1893). See also AVESTA.

Zoroastrianism. See ZOROASTER.

Zorrilla y Moral, José, hō-sā' thōr-rēl'yā ē mō-rā', Spanish poet: b. Valladolid 21 Feb. 1817; d. Madrid 23 Jan. 1893. He studied for the law at Toledo and Valladolid, but turned to literature. His attempts in politics showed him to be unfitted for such a career. From 1855 to 1866 he was in Mexico, latterly at the court of Maximilian. His plays, of which 'Don Juan Tenorio' is probably the best, are without finish, but have continued effective through their distinctively native quality and their adaptability to theatrical requisites. His 'Leyenda de Alhama,' 'Granada,' and 'Leyenda del Cid' were picturesque presentations of national legends in the general manner of Scott, and very popular. Zorrilla was not a careful artist, but an improvisator of great readiness and skill, both lyrical and dramatic. A bronze memorial was erected to him in Madrid in 1900. An account of him may be found in the autobiographic 'Recuerdos del Tiempo Viejo' (Old-Time Memories, 1880-3). There is a three-volume collection of his works.

Zosimus, zōs'i-mūs (Gr. Ζώσιμος), Greek historian of the 5th century A.D. He wrote a history of the empire in six books, which is frequently referred to by Gibbon. He begins with the change of constitution introduced by Augustus, and his first book brings him to the reign of Diocletian, 305 A.D.; in the second, third, and fourth books the history of the 4th century is given with more detail; the fifth and sixth books are occupied with the period from 395 to 410. From internal evidence the work must have been partly written after 425. Zosimus was a pagan, and severely criticised the Christian emperors, making the change of religion largely responsible for the decline of the empire. The best editions are those of Bekker (1837) and Mendelssohn (1887).

Zostera, a genus of marine grasses. See EEL-GRASS.

Zotal. See MISCAL.

Zouave, zōo-av, a soldier in the French army. Zouaves were originally mercenaries belonging to a Kabyle tribe. The Zouaves in the pay of the dey of Algiers were, when Algeria became a French possession, incorporated with the French army there, preserving their Arab dress. Ultimately the native element was eliminated, and the Zouaves became merely French soldiers in the picturesque Arab costume. As such they distinguished themselves in the Crimea and the Franco-Italian war of 1850. There were several regiments of zouaves among the Federal troops in the American Civil War.

Zouche, Richard, English legal scholar: b. Anstey, Wiltshire, 1590; d. London 1 March 1661. He was educated at New College, Oxford; in 1617 was admitted an advocate of Doctors' Commons; and in 1620 became regius

professor of civil law at Oxford. In addition to his university duties, he had a large practice in London. In 1641 he was made judge of the high court of admiralty. He was a royalist, though not a pronounced one, at the civil war; and although replaced in the judgeship in 1649, was nevertheless appointed by Cromwell to a special commission of oyer and terminer. He was restored to the bench in 1661. His writings include a descriptive poem, 'The Dove, or Passages of Cosmography' (1613); a comedy, 'The Sophister' (1639); and many works of a professional sort, most important of which are 'Elementa Jurisprudentiæ' (1629), a general system of legal science, and 'Juris et Judicii Fecialis Explicatio' (1650), regarded by critics as the first treatise containing a systematized arrangement of what is now known as international law.

Zrinyi, zrën'yë, Niklas, Count, Hungarian soldier: b. 1508; d. Szigetvár 7 Sept. 1566. He distinguished himself in the siege of Vienna by Charles V., and in campaigns against John Zápolya and Sultan Suleiman. As ban of Croatia from 1542, he defended that territory against the Turks, and became famous for his defense of Szigetvár (or Sziget) in 1566. His garrison of scarcely 3,000 was reduced to 600, and on 5 September the enemy succeeded in firing the outer fortifications. Zrinyi retreated to the inner fortress, but this also was soon on fire. He thereupon ordered the gates to be opened, and after firing a mortar filled with broken iron into the midst of the Turks, who were urging along a narrow approach to the castle, led a sally of the garrison. He fell, mortally wounded, and the defenders were forced back; but a slow match ignited 3,000 pounds of gunpowder stored within, and great carnage among the Turks ensued. The catastrophe has been made by Theodor Körner the subject of his 'Zrinyi. Ein Trauerspiel.'

Zschokke, chök'kë, Johann Heinrich Daniel, German author: b. Magdeburg 22 March 1771; d. Biberstein 27 June 1848. He quitted his native place in 1788, and for some time wandered about the country as play-writer to a strolling company of actors; but afterward studied at the University of Frankfurt-on-the-Oder. In 1792 he commenced life there as a private teacher, and produced several pieces for the stage. He subsequently settled down in the canton of the Grisons and became director of an academy at Reichenau, where he wrote a history of the Grisons (1798). He then became head of the department of public instruction at Aarau, and was soon afterward sent by the Helvetic executive directory to Unterwalden as government commissioner, for the purpose of restoring tranquillity. He acquitted himself so satisfactorily that his powers as commissioner were extended to the cantons of Uri, Schwyz, and Zug. In 1800 he was appointed commissioner for the organization of the Italian territories of Switzerland. In 1804 he became a member of the board of mines and forests; and in the same year began the issue of his highly popular 'Schweizerbote' (Swiss Messenger). Through the greater part of his life Zschokke appeared as one of the most distinguished and energetic public men in Switzerland, but he found time to cultivate his favorite

literary pursuits, and it is chiefly by his numerous writings, historical and fictitious, that he is known to the world at large. Among his works may be mentioned: 'Ueberlieferungen zur Geschichte unserer Zeit' (1811-27) (Contributions to the History of Our Time); 'Des Schweizerlandes Geschichte für das Schweizer-volk' (1822); (History of Switzerland for the Swiss People), one of the best of his works; and 'Bilder aus der Schweiz' (1824-6) (Pictures from Switzerland). As a writer of tales he possesses a European reputation, and among them we may refer more especially to 'The Creole,' 'Alamontade,' 'Jonathan Frock,' 'Clementine,' 'Oswald or the Goldmakers' Village,' and 'Master Jordan.' The work, however, which has had the most extended circulation is his 'Stunden der Andacht' (Hours of Devotion) (1809-16; last ed. 1901-2), which, though rationalistic, has yet, from the pious feeling pervading it, found admirers among all classes of readers. Consult the studies by Münch (1831); Keller, 'Beiträge zur Politische, Thätigkeit Zschokkes' (1887); and Wernly (1894).

Zuazo, thoó-á'thō, Alonso, Spanish jurist in the New World: b. Olmedo 1466; d. Santo Domingo 1527. A learned canon of Valladolid, he was appointed jurist of the commission which, at the request of Las Casas, was sent to the New World. He was given authority to organize justice in the West Indies, and to appoint judges. For his opposition to the complete abolition of enforced labor, he was denounced by Las Casas; although in Santo Domingo he emancipated the Indians who had been held in slavery by the officials. In 1518 he was despatched to Cuba to systematize the administration of justice in the island, and from 1525 until his death was auditor of the audiencia of Santo Domingo. Icazbalceta, in the 'Colección de Documentos para la Historia de México' (1858-66), gives an interesting narrative, written by Zuazo from Cuba in 1521, regarding the condition of the natives there and in Santo Domingo.

Zubly, John Joachim, American Independent Presbyterian clergyman: b. St Gall, Switzerland, 1725; d. Savannah, Ga., 23 July 1781. The date of his arrival in America is unknown; but in 1760 he became the first regular pastor of the Independent Presbyterian Church in Savannah, coming thither, according to the Church record, from Wando Neck, S. C. In 1775, at the provincial congress of 4 July, he was one of five delegates elected to represent Georgia in the Continental Congress, and was selected to draft a petition to the king regarding the "unhappy situation of affairs." In a letter of 3 Sept. 1775 to the Earl of Dartmouth, he denounced the suggestions made in England of arming the slaves to bring the Southern provinces to obedience. He took part in the adjourned session of the Continental Congress assembled 13 Sept. 1775. When he discovered the intention of the Congress to declare the independence of the United States, he revealed to Sir James Wright, royal governor of Georgia, the plans being made. One of the letters was seized, and Samuel Chase, of Maryland, referred to the fact on the floor of Congress. Zubly hastily withdrew, and in Georgia

openly made common cause with the Tories. In 1777 he was banished, and half of his estate seized. He remained in South Carolina until the royal government was re-established in 1779. He was an eloquent and learned preacher. Consult C. C. Jones, 'History of Georgia,' Vol. II. (1883).

Zuccarelli, dzoo-kä-rě'lě, or **Zuccherelli**, Francesco, Italian painter: b. Pitigliano, Tuscany, 1702; d. Florence 30 Dec. 1788. He studied painting at Florence and Rome, and after gaining some success in decorative landscape, worked for five years in London decorating the Opera-House and executing views of the Thames. He again came to England in 1752 and became a fashionable painter, patronized by the royal family, especially the Prince of Wales, and the aristocracy. He was one of the original members of the Royal Academy in 1768. In 1773 he returned to his native country. Numerous examples of his art are in Venice, the Palazzo Reale containing 21. A large number, too, are in Windsor Castle, and he is also represented in Glasgow, Edinburgh, Paris (Louvre), St. Petersburg (Hermitage), Milan (Brera), and other cities.

Zuccaro, dzook-kä'rō, or **Zuccherò**, Federico, Italian painter: b. Sant' Agnolo in Vado (Urbino) 1543; d. Ancona 1609. He was employed by Gregory XIII. to paint the vault of the Cappella Paolina in the Vatican, but having quarreled with some papal officials and painted a scurrilous picture he fled to France, and ultimately he reached England in 1574. There he painted portraits of Queen Elizabeth, the Earl of Leicester, and other distinguished persons (21 were exhibited in 1866), and afterward worked in Venice until he returned to Rome to complete his work in the Cappella Paolina. On the invitation of Philip II. he went to Madrid in 1586 to paint for the Escorial, and on his return to Rome he founded the Accademia San Luca, of which he became the first president. Many portraits of English personages in the Elizabethan era are wrongly ascribed to him, but some genuine works from his brush are extant. He was also something of an architect and sculptor. Among his easel-works are: 'Deposition from the Cross' (Palazzo Borghese, Rome); 'Descent of Christ into Limbo' (Brera, Milan); 'Sir Walter Raleigh' (Kensington Gallery); 'The Resurrection' (Borghese).

Zucchi, dzook-kě, **Antonio Pietro**, Italian painter: b. Venice 1726; d. Rome 25 Dec. 1795. In 1754 he accompanied the English architect Robert Adam on his journeys in Italy and Dalmatia, and on Adam's invitation he went to England in 1766. He decorated the interiors of several of the mansions built or altered by Adam, such as Caen Wood (Hampstead), Luton House (Bedfordshire), Osterley House (near Brentford), and Sion House (Middlesex). In 1770 he was elected an associate of the recently established Royal Academy. He married Angelica Kauffmann (q.v.).

Zuchetto, tsük-kět'ō, the skull cap of a Roman Catholic ecclesiastic covering the tonsure. That of a priest is black, of a bishop or monsignor purple, of a cardinal red, and of the pope white.

Zueb'lin, Charné, Sociologist: b. Pendleton, Ind., 4 May 1866. He was educated at the University of Chicago, Northwestern, and Yale; became an instructor in sociology at Chicago in 1892; was assistant professor in 1895; and associate professor from 1895 to 1902. In 1902 he was made professor. Among his writings is 'American Municipal Progress' (1902).

Zug, tsoog or zoog, Switzerland; (1) The capital of the canton of the same name, on the northeast shore of Lake Zug, 12 miles by rail northeast of Lucerne. It has splendid old mansions and strong watch-towers; several interesting churches; a Capuchin monastery and a convent; a cantonal government building in Renaissance style; a fine town-house in late Gothic style, with a museum of antiquities; an arsenal; manufactures of cottons, enamel-ware, metal goods, tobacco, cigars, soap, etc. In 1435, 1594, and 1887 portions of the town sank into the lake. Pop. (1900) 6,597. (2) A central and the smallest undivided canton of Switzerland, bounded by Zurich, Schwyz, Lucerne, and Aargau. The surface, which is generally mountainous in the southeast and south, where the Rossberg occupies the frontier, slopes more or less gradually north and west till it becomes comparatively flat. The only lakes deserving the name are those of Zug and Egeri. The climate, rigorous in the mountainous districts, is mild on the lower southern slopes. The chief exports are cattle, fruits, cider, and "kirschwasser." Area, 92 square miles; pop. (1900) 25,093. (3) A lake chiefly in the canton of Zug, but partly also in Lucerne and Schwyz. It is 1,340 feet above sea-level; 12 miles long north to south, and varies in breadth from three miles to one mile at the centre. The shores are low in all directions except the south and southeast. In the former direction the Righi, with Mount Pilatus towering behind it, and in the latter the Rufiberg or Rossberg, rise in abrupt and lofty precipices, presenting scenery of the grandest description. At the foot of the Rossberg the depth of the lake is not less than 1,200 feet. Steamers ply upon it, and the fishing, principally of pike and carp, is very productive.

Zuider-Zee, zī'dēr zē, Dutch, zoī'dēr-zā, or **South Sea** (as opposed to the North Sea), Netherlands, a large gulf penetrating deeply between the provinces of Friesland, Overijssel, Gelderland, Utrecht, and North Holland; about 80 miles long, 45 miles greatest breadth, but only 10 miles broad between Enkhuizen and Stavoren. The islands Texel, Vlieland, Terschelling, Ameland, etc., separate it from the North Sea, with which it communicates by various channels, the principal being Marsdiep, between the Helder and Texel, and the Vlie Strom between Vlieland and Terschelling. It contains the islands of Wieringen, Marken, Urk, and Schokland, and numerous sandbanks, especially in its northern portion; has on its shores numerous towns, and receives the waters of the Yssel, Vecht, Eem, Kuinder, etc., but is generally shallow, and only navigable by vessels of small draught. Oysters and plaice are plentiful. A great part of it is to be reclaimed at the expense of the Dutch government, by enclosing tracts along the margin with dams and pump-

ing ~~on the~~ water. This great undertaking when carried out will add a large area to the kingdom. The Zuider-Zee is of modern origin, having been formed chiefly since the 12th century by successive irruptions of the sea. In earlier times there were here only a lake and marshes.

Zulia, thoo'lē-ā, Venezuela, the most northwestern state of the republic, surrounding Lake Maracaibo (q.v.), bounded on the west by Colombia and on the east by Falcón. It was formerly united with Falcón, but is now politically independent. Lake Maracaibo is surrounded by low lands, but a great part of the rest of the province is mountainous. Agriculture is the chief industry; coffee, sugar, and cacao are raised. Area, 24,966 square miles; pop. 100,000.

Zuloaga, thoo-lō-ā'gā, Félix, Mexican politician, president of the republic: b. Alamos, Chihuahua, 1814; d. Mexico 1876. Having entered the national guard as a lieutenant, he fought against the Yucatan secessionists in 1842-3, in 1843 rose to be lieutenant-colonel, and in preparation for the war with the United States directed the fortification of Monterey and Saltillo and of the southerly approaches of the capital. From 1848 to 1853 he was not in active service, but in 1853 was promoted colonel, and subsequently variously employed. On 17 Dec. 1857 he conspired against the Liberal government, and finally on 11 Jan. 1858 the brigade of which he was the commander declared Comonfort (see COMONFORT, YGNACIO) deposed and Zuloaga president. Zuloaga entered on the office 23 January, and the "War of Reform" began, the Liberals being under the leadership of Juárez. In December the garrison deposed Zuloaga, who finally resigned, and appointed as a substitute Gen. Miramon (q.v.), who assumed office 2 February. In 1860 Zuloaga published a manifesto proclaiming himself constitutional president, but subsequently he came to an agreement with Miramon. When the French invaded Mexico in 1862, he withdrew, but in 1864 he returned and submitted to the empire, though he took no further part in political affairs.

Zululand, zoo'loo-länd, South Africa, a country lying on the southeast coast of Africa, now a province of Natal, extending westward to the Transvaal Colony, and northward to Tongaland. Area, about 10,450 square miles. The principal rivers are the Tugela, on the Natal boundary; the Buffalo, which joins the Tugela on the left, about midway up the Natal frontier, and forms the remaining portion of the boundary between Natal and Zululand; and the Umvolosi, which flows into St. Lucia Bay. From the coast at St. Lucia a range of mountains called the Libombo range runs northward nearly parallel to the coast, separating the country into two regions. The coast region is unhealthy. The inland region is comparatively healthful, fertile, and capable of cultivation. Rich gold reefs have been found, and excellent coal exists. The coal is being worked and a railway has been constructed to the Tugela. The country, which since 1897 has been attached to the colony of Natal, is mainly inhabited by the Zulus, who have long been distinguished as the most warlike of the Kaffir tribes. The country inhabited by the Zulus was formerly much more extensive. In the beginning of 1879 the Zulu king, Cetewayo or Ketch-

wayo, with a large army of fairly disciplined troops armed with rifles, came into collision with the British in South Africa. This was partly due to a long-standing dispute as to the claims of the Zulus to the Utrecht district in the southeastern angle of the Transvaal, partly to other causes, which at last induced Sir Bartle Frere, the governor-general of the British provinces in South Africa, to send an ultimatum to Cetewayo. To this no reply was sent, and war ensued. On 22 January a portion of a British column was attacked at a place called Isandula or Isandhlwana, about 10 miles from Rorke's Drift on the Buffalo, by 20,000 Zulus, and completely destroyed. As soon as possible after the news of the disaster reached England, strong reinforcements were sent out, and on 4 July following the Zulu army was totally defeated at Ulundi. On 28 August Cetewayo was captured. Meanwhile Sir Garnet Wolseley had arrived with supreme military and civil authority in this part of Africa, and the Zulu territory was parceled out by him among several chieftains who were placed under the paramount supremacy of the British government, and were not to be allowed to keep up standing armies, or to import firearms or ammunition. British residents were appointed, one in North and one in South Zululand. In 1883 Cetewayo was restored to a portion of his dominions, but was opposed by some of the chiefs. After severe fighting he placed himself in the hands of the British at Ekowe or Eshowe, where he died in 1884. Subsequently the Boers of the Transvaal made themselves masters of a considerable portion of the territory and incorporated it with their own republic. In 1885 the British assumed a protectorate over the coast of the country, and in 1887 annexed all the rest. A strip between Tongaland (now a British protectorate) and Swaziland also belongs to Zululand. Pop. (1898) 201,365.

Zumalacarregui, thoo - mä'lä - ká'rā - gē, Tomas, Spanish soldier and Carlist leader: b. Ormaiztegui, province of Guipuzcoa, 1788; d. Segama, Navarre, 23 June 1835. He distinguished himself in the war for independence, subsequently entered the regular army, became a lieutenant-colonel in 1825, and later colonel. Ferdinand VII. made him governor of Ferrol, but Cea Bermudez, the prime-minister, removed him. Soon after the death of Ferdinand, he became the head of the Carlist bands in the Basque provinces and Navarre. With great ability he organized these troops into a really formidable force, and wielded them with remarkable success against such generals as Valdés, Quesada, and Rodil. Finally, when the constitutional army had been signally outfought, Don Carlos, against Zumalacarregui's advice, determined to attack Bilbao. Zumalacarregui's plan was to march upon Madrid by way of Victoria and Burgos, and he regarded the siege of Bilbao as a waste of time. It was during the operations there that he received the wound from which he eventually died. He was the most able figure of the first Carlist war. Consult Henningsen, 'Twelve Months of Campaign with Zumala-Carregui' (1836).

Zumarraga, Juan de, hoo-än' dā thoo-mär'-rā-ga, Spanish prelate in America: b. Durango (Biscay) 1468; d. Mexico 3 June 1548. He was for many years guardian of the convent

of Abrojo in Spain, and in December 1527 was appointed bishop of the newly established see of Mexico. He greatly developed the Mexican missions, but directed considerable misguided zeal against Aztec manuscripts, which he gathered together all over Mexico and publicly burned. Only comparatively few escaped this destruction. His see was elevated to an archbishopric in 1548.

Zum'bo, South Africa, a town of Portuguese East Africa, near the confluence of the Loangwa with the Zambesi, and on the frontier line of North Rhodesia, 450 miles from the mouth of the Zambesi. It marks the western point of the Portuguese territories on the Zambesi, and was formerly the seat of an important trade, but its trade has declined greatly and the town itself has decayed. The active development of this region will probably restore its importance.

Zumpt, tsoompt, **August Wilhelm**, German classical philologist: b. Königsberg 4 Dec. 1815; d. Berlin 23 April 1877. He was nephew of Karl (q.v.). He was a professor in the Friedrich-Wilhelms gymnasium of Berlin from 1851. Among his publications were editions of Rutilius Namatianus (1840) and the 'Monumentum Ancyranum' (1845); 'Commentationes Epigraphicae ad Antiquitates Romanas Pertinentes' (1850-4); and 'Studia Romana' (1859). The larger part of the last two volumes of the German edition of Ihne's 'History of Rome' is the work of Zumpt.

Zumpt, **Karl Gottlob**, German philologist: b. Berlin 20 March 1792; d. Karlsbad 25 June 1849. Educated at Heidelberg and Berlin, and in 1827 appointed professor at the latter, he did much effective work toward the improvement of instruction in the Latin language. Among his writings were a Latin grammar (1818; 13th ed. 1874); editions of Quintilian (1831); Curtius (1826; 1846), Cicero's orations against Verres (1831), and the 'De Officiis' (1838); and several treatises, such as 'Die Religion der Römer' (1845). An abbreviation of the grammar (1824) reached a 9th edition in 1866.

Zuñi (zoo'nī) **Mountains**, a detached range in Valencia County, New Mexico. The general trend is from southeast to northwest; length, 45 miles. The mountains do not rise more than 10,000 feet above sea-level, and this is only from 3,000 to 4,000 feet above the surrounding plateau. The range is heavily timbered. It is of geological interest on account of its isolation and the simplicity of the stratification.

Zúñiga, thoon-yé'ga, **Alvaro Manrique de**, Spanish viceroy of Mexico: b. Seville about 1530; d. Madrid about 1600. He entered Mexico in October 1585 as viceroy, and his administration was, according to the historian, Juan de Torquemada, one of prudence and wisdom. A dispute with the audiencia of Guadalajara, however, on a point of jurisdiction, nearly precipitated civil war upon the colony. Philip II., on the basis of reports circulated by his foes, finally removed him in 1589, and directed Pedro Romano, the bishop of Tlaxcala, to investigate Zúñiga's government. Romano persecuted Zúñiga with great cruelty until 1596, when the latter sailed for Spain, where he was successful

in getting revoked the sentence of excommunication pronounced against him.

Zúñiga, **Dionisio de**, Central American missionary: b. Guatemala about 1550; d. Chiapa about 1620. He became a Dominican in Chiapa province, and for the greater part of his life was a missionary among the Quiché Indians. He wrote a grammar of the Quiché dialect, and prepared also in Quiché a volume of sermons and several religious treatises, besides translating Francisco Viana's works, originally written in the dialect of Vera Paz.

Zúñiga y Azevedo, ē ā-thā-vā'thō, **Gaspar de**, COUNT OF MONTEPEY, Spanish viceroy in America: b. Andalusia about 1540; d. Lima, Peru, 10 Feb. 1606. He took vice-royal charge of Mexico 5 Nov. 1595, and in 1596 sent an expedition in command of Sebastian Vizcaino (q.v.) for the exploration and occupation of Lower California. Vizcaino was hampered by lack of provisions, and returned after accomplishing little. By royal order, he was again sent out by Zúñiga in 1602, exploring the coast of Upper California. In 1597 Zúñiga drove out William Park, an English pirate who had taken possession of Campeche. Among other expeditions organized by him was one commanded by De Oñate (see OÑATE, JUAN DE) and Zaldivar to take New Mexico. During his administration in Mexico he was a benefactor of the natives. In 1603 he became viceroy of Peru, though he did not enter Lima until 1604.

Zunz, **Leopold**, German Jewish scholar: b. Detmold, Germany, 10 Aug. 1794; d. Berlin 17 March 1886. He studied at the University to 1839 he was in Prague as preacher at the synagogue of Berlin; and in 1824-32 was editor of the 'Spencersche Zeitung.' From 1835 to 1839 he was in Prague as preacher at the synagogue there, but in 1839 returned to Berlin to become director of the normal seminary, holding that position until 1850. In 1845 he was made a member of the board of commissioners for the promotion of the educational interests of the Jews. He was the first to take up the scientific study of the Jews' rabbinical literature in his 'Etwas über die rabbinische Literatur,' published in 1818; and his 'Die gottesdienstlichen Vorträge der Juden' (1832) is considered the authoritative work on the biblical exegesis and the homiletics of the rabbinical writings. Among his other works are 'Die Namen der Juden' (1836); 'Die synagogale Poesie des Mittelalters'; and 'Literaturgeschichte der synagogalen Poesie' (1865).

Zurbaran, thoor-bā-ran', **Francisco**, Spanish painter: b. Fuente de Cantos, Extremadura, 7 Nov. 1598; d. Seville 1662. He was educated in the school of Juan de Roelas in Seville, and early formed his style on that of Caravaggio. He is thence frequently known as the Spanish Caravaggio. He first brought himself into notice by a series of pictures for the chapel of St. Peter in the cathedral of Seville, illustrating the life of the apostle; and about 1625 he executed his celebrated picture of 'The Glory of St. Thomas Aquinas' (Seville Museum), which is esteemed his masterpiece, and is one of the finest works in Spain. As early as 1633 he signed himself painter to the king. In 1650 he executed for the palace of Buen Retiro the 'Labors of Hercules' in 10 pictures, now in the

ZURICH — ZUTPHEN

Madrid Museum. Though he painted several large compositions, he preferred small and simple ones, generally religious in subject. He especially made studies of the Spanish friar. His works are to be seen in some private collections, and in the galleries of St. Petersburg, Pesth, Munich, Paris, and London. Consult: Bermudez, 'Diccionario de los Mas Ilustres Profesores' (1800); and Lefort, 'La Peinture Espagnole' (1894).

Zurich, zoo'rik, Switzerland; (1) a city, capital of the canton of the same name, situated at the northeast extremity of the lake of the same name. It is divided by the Limmat into unequal parts, forming an upper and lower town, connected with their suburbs by several bridges. The streets in the oldest quarters are narrow, crooked, and dark, but have undergone considerable improvement. The principal buildings are the cathedral or Grosse Munster, on a hill near the right bank of the Limmat, a heavy massive structure in the Byzantine style; the Fraumunster, on the left bank of the river; St. Peter's Church, with a fine tower and clock; the town-house; the town library, containing 100,000 volumes; the museum, with a collection of home and foreign periodicals, and a rich library; the university; the new Swiss polytechnic school; the arsenal; the music buildings; the railway station; the theatre and the post-office. Two public promenades add to the attractions of the city, besides a botanical garden and many smaller parks and walks connected with a variety of institutions public and private. Manufactures of silk and cotton, including dyeing and calico-printing, are extensive; those of candles, soap, tobacco, paper, leather, and machinery are also considerable. Besides the university, founded in 1832, and having a professorial staff of 124, and over 700 students in theology, law, medicine, and philosophy, there are a polytechnic school, schools of medicine and of arts, secondary and elementary schools of all kinds, deaf and dumb and blind asylums, orphan and several other hospitals. Learned and other societies of various descriptions abound. Zurich is of great antiquity, and early became a Roman station. In 1219 it was declared a free imperial city. The preaching of Zwingli in the cathedral made it the centre of the Swiss Reformation. Here, in 1443, the Swiss defeated the Austrians; and here also, in 1799, the Russians were defeated by the French. The Treaty of Zurich, signed here 10 Nov. 1859 by the plenipotentiaries of France and Austria, closed the Franco-Italian war by Austria's abandonment of her right to Lombardy. Pop. including suburbs (1901) 152,942. (2) A northern canton bounded north by Schaffhausen and grand duchy of Baden, west by Aargau, south by Zug and Schwyz, and east by Saint Gall and Thurgau; area, 665 square miles. Though not properly mountainous, it has on its south and southeast frontiers several lofty ridges, remarkable for their parallelism. Except the Lagern and adjoining heights, they have their longer axis from southeast to northwest, and form a succession of terraces lowering gradually toward the north. The culminating points are the summits of the Hornli and the Schauenberg, both in the east. The general slope is toward the left bank of the Rhine, which drains part of it directly, and part

indirectly, by the Thur, Töss, Glatt, and Limmat. Of the lakes, about 40 in all, the most important are those of Zurich, Greiffen, Pfeffikon, Turler, and Katzen. The climate is on the whole temperate, but mists are prevalent, particularly on the lower grounds. In some parts the prevailing rock is the Jura limestone, but a more recent formation, consisting chiefly of marl and sandstone in almost horizontal strata, is still more largely developed. One remarkable feature is the immense number and magnitude of the granite boulders which cover the surface. The minerals are few and of little value. The soil, with the exception of a few favored spots, is far from fertile, and hence, though the arable land is comparatively large and carefully cultivated, the corn produced falls short of the consumption. In some districts a wine of tolerable quality is produced. Wood seldom forms forests, but occupies many scattered patches and hedgerows. Game is scarce; fish almost superabundant. In no canton have manufactures made more progress. The great staples are silk and cotton goods. The inhabitants are almost all Protestants, and education is very generally diffused. Zurich was admitted into the Swiss Confederation in 1351, and readmitted in 1450, after a 10-years' alliance with Austria. The government, formerly somewhat aristocratic, became decidedly democratic in 1831. A new democratic constitution was adopted in 1869. Zurich holds the first place in the Swiss Confederation. Pop. (1900) 430,336. (3) One of the principal lakes of Switzerland, chiefly in the canton of Zurich, but partly also in Schwyz. It forms a long irregular curve, bending round from southeast to northwest, convex on the south, and concave on the north side; greatest length, about 27 miles; greatest breadth, not exceeding three miles; greatest depth, 600 feet. Its scenery is distinguished not so much for grandeur as for beauty. The mountains around, nowhere exceeding 1,700 feet above the lake, commence in wooded heights, and descend to the water's edge in gentle slopes, covered with vineyards, orchards, gardens, cultivated fields, and verdant meadows, and studded over with country-seats and smiling villages. A considerable traffic is carried on upon the lake by means of sailing vessels, and numbers of steamers. It is well supplied with fish. Its chief feeder is the Linth Canal, communicating with the Wallenstatter-see. It discharges itself at the town of Zurich by the Limmat.

Zurita, thoo-ré'tä, **Geronimo**, Spanish historian: b. Saragossa 4 Dec. 1512; d. 3 Nov. 1580. He was educated at Alcalá, in 1543 was sent to Germany on a diplomatic mission to Charles V., and subsequently was made councillor of state and secretary to Philip II. Appointed chronicler of Aragon, he traveled in quest of data through Spain, Sicily, and Italy, and finally in 1562-80 published in six volumes his 'Anales de la Corona de Aragon,' continued by Argensola and Blasco-Lanuza (1622). He also made important corrections in, and additions to, Lopez de Ayala's (see AYALA, LOPEZ DE) 'Crónicas de los Reyes de Castillas.' For a biographical sketch and some correspondence, consult Dormer, 'Progresos de la Historia en Aragon' (1680).

Zütphen, züt'fën, Netherlands, a former fortified town in the province of Gelderland, 27

miles northeast of Arnhem, on the right bank of the river Yssel, where it is joined by the Berkel. Its chief edifice is the 12th century church of Saint Walpurgis. The town was at one time a member of the Hanseatic League, and had a considerable foreign trade, which has ceased. It still has an active home trade, more especially in sending timber, both rough and prepared, down the Yssel. Pop. (1900) 18,490.

Zuyder Zee. See ZUIDER-ZEE.

Zweibrücken, tsvi'brük-ën (Latin, *Bipontium*; French, *Deux-Ponts*, "Two Bridges"), Germany, a town of Bavaria, on the Schwarzbach, 34 miles west by north of Landau. It was the capital of a mediæval duchy until the end of the 18th century. It is well built, and has Protestant and Roman Catholic churches and a synagogue; gymnasium, real-school, and several other schools; courts and public offices occupying the former ducal palace; an orphanage and hospitals; manufactures of silk plush, machinery, chicory, tacks, chains, leather, etc., and a trade in corn and cattle. The edition of the classics known by the name of 'Bipont' was published here in 1779 and subsequent years. Pop. (1900) 13,716.

Zwickau, tsvik'ow, Germany, a town of Saxony, on the left bank of the Mulde, 60 miles by rail west-southwest of Dresden. It has several interesting churches, among them two ancient Gothic ones recently restored, one of them dating from the 12th century; a gymnasium with a library; and an old castle converted into a penitentiary. The chief source of its wealth is the rich coal beds in the vicinity, employing 8,000 miners, and yielding annually \$5,000,000 worth of coal. There are also manufactures of linen and cotton goods, dyes, and chemical products, numerous tanneries, dye-works, bleach-fields, oil, saw, and other mills, and a considerable transit and general trade. See ANABAPTISTS for the "Prophets of Zwickau." Pop. (1900) 55,830.

Zwinger, tsving'ër, **Theodor,** Swiss scholar: b. Basel 2 Aug. 1533; d. there 10 March 1588. He studied at Basel, and after a course in medicine at Padua, became a member of the Basel medical faculty. He lectured there on Greek in 1565-71 and subsequently on ethics, and from 1580 was professor of the theory of medicine. Zwinger was a type of the universal scholarship of that time; and wrote a 'Theatrum Vitæ Humanae,' a kind of general encyclopedia, then regarded as a marvel, but now having only a bibliographical interest. His 'Methodus Apodemica' contains material valuable for local history. Consult 'Athenæ Rauricæ' (1778), which contains a list of his writings.

Zwinger, The, a public building in Dresden, containing a valuable collection of works of art and scientific treasures. The word Zwinger is a general name for a prison, or any confined place.

Zwingli, zwing'lë, Ger. tsving'lë, or **Zuinglus Ulrich,** a celebrated Swiss reformer, was a contemporary of Luther (q.v.), and was born at Wildhaus, canton of Saint Gall, on 1 Jan. 1484. Ulrich was the third of eight sons of the bailiff of that place. He studied

at an early age in Basel and Bern, and continued his studies in Vienna, where he occupied himself with philosophy, and again in Basel, where he devoted his attention to theology, under the direction of Wyttenbach. In 1506 Zwingli became parish priest at Glarus, and here employed his time, as Luther had done in the Augustinian monastery at Erfurt, in the diligent reading of the Holy Scriptures. He copied the epistles of Saint Paul in the original Greek, and even learned them by heart—an acquisition which afterward proved of great service to him in his public discussions. He accompanied the forces of Glarus during the campaigns of 1512, 1513, and 1515, in Lombardy, in the cause of the pope against the French, in the capacity of chaplain, and was rewarded for this service by the grant of a pension from the pope. In 1516 he became preacher in the convent of Einsiedeln, then a celebrated place of pilgrimage. Here he began to make known publicly his ideas of reform, preaching against the pilgrimage of Einsiedeln, which he termed an abuse and a corruption of the doctrine of the Christian Church, and calling upon the bishops of Sion and Constance to promote a reformation of religious doctrines, upon those points in which Zwingli considered that the Church had departed from the primitive teaching. Up to this time, however, his ideas of innovation excited no rebuke upon the part of the authorities, and he was, not long after, invited to Zurich, and entered on his office of preacher in the cathedral 1 Jan. 1519, with a discourse in which he declared himself for the use of the simple Scriptures without regard to the prescribed texts and lessons. At Zurich Zwingli delivered a series of sermons on the Holy Scriptures; and these discourses in which he inveighed against what he declared to be the errors and superstition of the times, laid the foundation for his future work of reformation. The occasion which launched him on his career was similar to that which had aroused Luther. In 1518 Bernadin Samson, a Franciscan monk of Milan, appeared in Switzerland to preach the indulgence proclaimed by Leo X. to all who should subscribe alms to the building of St. Peter's Church at Rome. Zwingli, who was then preaching at Einsiedeln, opposed him there, and afterward in Zurich, with all the power of his eloquence, and brought the indulgences into so much odium that Samson was not even permitted to enter Zurich; and the Council of Zurich finally obtained from the Papal Nuncio the recall of Samson to render an account of his mission at Rome. From this time Zwingli gradually went further in his plans, supported by the Zurichers. In Zurich his innovations were so far promoted by the government that in 1520 a decree was issued ordering that the Holy Scriptures should be taught "without human additions." In 1522 the reformation was extended to external ceremonies. In this year Zwingli was forbidden to preach by the bishop of Constance. In it also he wrote his first work against the fasts of the Church and began the study of Hebrew. In 1523 the government in Zurich invited all theologians to a public conference in Zurich, to convict, if possible, Zwingli of an error in doctrine. About 600 persons, clergy and laymen, were present at this disputation. Zwingli exhibited his opinions in the form of 67 propositions, which were to form

ZWOLLE—ZYMOTIC DISEASE

the subject of discussion. The celebrated John Faber, the vicar-general of the bishop of Constance, refused to discuss any of Zwingli's propositions save the last one, which denied the supreme authority of the Church, whereupon the Council of Zurich decreed that Zwingli had not been convicted of error or heresy, and "might continue to freely announce the holy gospel and the Word of God according to the new order." In a second dispute Zwingli urged his objections to images and the mass, and the former were soon afterward removed from the churches by order of the Council and the latter abolished. In 1524 Zwingli married Anna Reinhard, a widow, and the next year published his commentary on "True and False Religion." The Reformation in Switzerland was now fixed upon a firm base; and Zwingli continued the work with undiminished zeal, warmly supported by the cantons which espoused the Protestant cause. The religious orders were suppressed, and all questions of marriage were placed under the jurisdiction of the civil tribunals, as well as the administration of the Church revenues. In general, Zwingli agreed in his opinions with the German reformers; like them he assumed the Bible as the only rule of faith, rejected the Papacy, attacked the authority of the priesthood, and declared that his object was to restore the Church to the simplicity of primitive times. His views differed on some points from those of Luther, particularly in regard to the real presence, and on some less important matters relative to the liturgy. In order to remove this wall of partition from between the two parties which adopted the new doctrines, a meeting between the Saxon and Swiss reformers was held at Marburg (1-3 Oct. 1529) at the suggestion of Philip, the Landgrave of Hesse. The former were represented by Luther and Melancthon, the latter by Zwingli and Oecolampadius. Although a complete union was not effected, yet a convention was agreed upon, the first 13 articles of which, containing the most important matters of religious faith, were recognized by both parties; and the 14th declared that, though they could not agree as to the real presence of Christ in the eucharist, they would behave reciprocally in the spirit of Christian charity. In 1531 an open war broke out between Zurich on the one side and the Catholic cantons of Lucerne, Schwyz, Uri, Unterwalden, and Zug on the other; and Zwingli was commanded to take the field, bearing the banner of the canton, which it had been usual for an ecclesiastic to support. A battle ensued at Cappel, on the 11th of October. But the enemy were more than twice as strong as the Zürichers, and under better officers; the latter were therefore defeated, and Zwingli was among the slain. The Reformed Church in Switzerland afterward received from the hands of Calvin (q.v.) its present organization. The collected works of Zwingli were published at Zurich in 1545. A complete collection of Zwingli's writings was also published at Zu-

rich in eight volumes in 1828. E. Zeller has attempted to deduce Zwingli's doctrines from his writings, 'Das theologische System Zwinglis dargestellt' (Tübingen 1853). There are numerous biographies of this reformer, for example, 'Huldreich Zwingli, sein Leben und Wirken' (1895-7) by Stähelin. Consult also Jannsen, 'History of the German People' (1903).

GEORGE E. RINES,

Editorial Staff, 'Encyclopedia Americana.'

Zwolle, zwöl'lě, Netherlands, capital of the province of Overijssel on the Zwart Water, 25 miles north of Zutphen. Formerly it was a member of the Hanseatic League and was a strong fortress with 11 bastions and three forts. It is a well-built city, with handsome boulevards on the site of its ancient ramparts, and three fine suburbs. Its corn market is one of the best in Holland. Its chief buildings are Saint Michael's Church, a large and splendid building with a famous organ, the government buildings with the provincial archives, the town-hall, and the courts of justice. The town has a Latin school, a school of navigation, an industrial school, a public library with rare works on geography and local history, a museum of natural history, a theatre, etc. Zwolle has communication with the sea by means of the Willemsvaart Canal. It manufactures oil, spirits, iron goods, and linens, carries on shipbuilding, and a trade in corn and cattle. In a monastery in the neighborhood Thomas à Kempis lived and died. Pop. (1900) 30,348.

Zylonite, Xylonite, same as celluloid. See CELLULOID.

Zylonite, a material made by treating cellulose or vegetable fibre with nitric and sulphuric acids, dissolving the resulting pulp in camphor, and then drying it. In its liquid state, collodion, it was used in surgical operations as early as 1848; in 1855 zylonite was manufactured by Alexander Parkes of Birmingham, England, and put on the market as parkesine. About the same time several factories for the manufacture of zylonite were established in France and Germany, England, and the United States. In 1869 celluloid (q.v.), a kind of zylonite, was first manufactured, and has entirely superseded all other forms of zylonite.

Zymotic Disease, any disease caused and continued by a living germ introduced from without into the body and there multiplied. The term was formerly applied to epidemic and endemic contagious diseases because they were supposed to be produced by some morbid principle acting on the system like a ferment (Greek ζύμη). The chief of such diseases include measles, scarlet fever, smallpox, typhus, diphtheria, whooping-cough, croup, and erysipelas (qq.v.). With the development of present theories and scientific knowledge of infectious disease, the term zymotic has been almost abandoned. See BACTERIOLOGY; DISEASES, GERM THEORY OF; MALARIA; NOSOLOGY.
